MEMOIRS OF A GOOD-FOR-NOTHING.

A Novel of the German Romantic School,

By JOSEPH VON EICHENDORF.

Translated by CHARLES G. LELAND.

With illustrated Title-page and Vignettes, by E. B. Bensell.

1 vol. 12mo, $1 75.

MEMOIRS OF A GOOD-FOR-NOTHING.

"A fine old German story, full of quaint humor and sweet touches of nature.—*Springfield Republican.*

"It is issued in exquisite style. The vignettes, by E. B. Bensell, are executed in admirable taste, and add greatly to the appearance of the volume."—*Philadelphia Age.*

"It is full of that caustic humor and eloquent sentiment for which the best German authors are celebrated.—*Boston Post.*

"Mr. Leland's genius graces everything he touches, and in the present he has done himself full justice."—*Boston Saturday Evening Gazette.*

LAWS OF SHORT WHIST.

Edited by J. L. BALDWIN.

The Standard adopted by the London Clubs.

And a Treatise on the Game by J. C.

1 vol. 16mo, $1 25.

"A treatise on whist as attractive and clean as a missal belonging to one of the devotees of Mother Church. Having been for thirty-six years a player and lover of the game, we commend the book to a beginner desirous of playing well."—*Boston Commonwealth.*

"Hoyle would almost have gone beside himself with delight could he have seen the art in which he was an adept dignified with such exquisite typography and tasteful binding as are expended on this little manual."—*New York Times.*

The publishers will send either of the above works, post-paid, on receipt of the price.

In Cloth Extra and Half Morocco.

546 BROADWAY,

Two doors from Messrs. Tiffany's.

FINANCIAL REVIEW.

NATION OFFICE, Thursday Evening,
May 17, 1866.

THE markets are kept in a feverish condition by the war news from Europe. Cotton has declined in Liverpool to 12¾d. to 13d. for middling uplands. A week ago the decline abroad led to a corresponding concession by holders here; but since then telegraphic advices of a heavy falling off in the receipts at the Southern ports, coupled with "bear" predictions respecting the yield of the new crop, have imparted fresh activity to our market, and an advance of 1 to 2 cents has been realized. Cotton is now considerably higher here than in England. So are all kinds of breadstuffs and provisions, and in the case of some descriptions the difference leaves a margin for profit on importations from Europe. Two cargoes of American wheat arrived here a week ago from Liverpool and were sold yesterday at a fair profit. American lard is likewise coming here from Great Britain. The country is thus without the means of paying its debts to Europe by the shipment of its staple exports, and in their absence gold is going forward. Yesterday about $3,500,000 in coin and bars were shipped, and on Saturday a further considerable shipment is expected. Exchange on London rules at 109⅝ to 109¾ for bankers' bills.

The renewal of specie shipments would have led to a smart advance in the premium on gold but that the Treasury Department appeared in the market as a seller. A million or so was sold on Tuesday, and about six millions yesterday at 130⅛ to 130¼. This checked the upward tendency of the market. Opinions vary with regard to the policy of these Government sales. There are many who charge the Government officials with speculating upon their knowledge of the purposes of the department; but thus far there is no evidence that the public interests have suffered by the operations—if there have been any such—of the parties "within the ring."

Money continues a drug; call loans are 4 to 5 per cent. Should Government continue to sell gold, the banks would lose greenbacks enough to make a change in the market. The report of the investigating committee on the Merchants' Bank of Washington is anxiously looked for. It seems monstrous that Government should be paying 4 to 5 per cent. interest for money which it leaves free of interest in the national banks, which, in their turn, lend it to speculators at 5 to 6 per cent. It is whispered that part of the very money which Government left with the Merchants' National Bank was used to effect the late corner in Michigan Southern. Reform in this branch of the administration is essential, or a financial crisis will soon become inevitable.

Stocks have been rather more active within the past day or two. Governments have been generally lower on sales of bonds imported from abroad or to arrive. Old 5-20s sold as low as 101¼, rallying afterwards to the price given in the table. A clique movement in Erie forced up the price on Monday to 76, but at the advance the buyers realized and the stock fell back at once. The May earnings thus far show a falling off not less than that of April. Central was rushed up to 94 yesterday on purchases by a new party. To-day it sold as high as 94½. Pittsburg and Fort Wayne are firmly held. Rock Island is weak; the holders are evidently willing to let the public have as much stock as they need. Active fluctuations take place in the lighter fancies. Canton rises steadily; sold as high as 62. Boston Water Power, which was 36 a week ago, was quoted yesterday at 43½, and this morning at 41. Cumberland jumped up this morning to 49, but was afterward done at 47½. On the other hand, Mariposa Preferred, which sold at 25¼ ten days since, was done yesterday at 19⅛, and Western Union Telegraph, which was 64 to 65, sold yesterday at 58. The ease of money tempts speculators to buy for the rise, but when they try to sell the absence of any substantial consumptive demand for stocks becomes very apparent.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	May 10.	May 14.	May 17.	Advance.	Decline.
United States Sixes of 1881	109⅛	109	108¾	....	¼
5-20 Bonds, old	102	101⅞	101¾	....	⅛

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

J. W. & H. JUDD, GENERAL AGENTS,

☞ Active and efficient AGENTS wanted. Apply as above.

DEMULCENT SOAP,

FOR CHAPPED AND TENDER HANDS,

FOR TOILET AND BATH USE.

MANUFACTURED ONLY BY

J. C. HULL'S SON,

32 PARK ROW, N. Y.

Upwards of 100 styles of Toilet and Staple Soaps. For sale by all Dealers.

OAKLEY & MASON,

PUBLISHERS, BOOKSELLERS, STATIONERS'

AND BLANK-BOOK MANUFACTURERS,

21 MURRAY STREET,

OLD STAND OF PRATT, OAKLEY & Co.,

Between Broadway and Church Street, New York.

ARCHER & PANCOAST,

Manufacturers of

GAS FIXTURES,

AND

COAL-OIL LAMPS, CHANDELIERS, ETC.,

OF EVERY DESCRIPTION.

DECKER & CO.,

MANUFACTURERS OF PIANO-FORTES,

419 BROOME STREET,
One Block East of Broadway, N. Y.

These Pianos stand unrivalled in regard to their singing quality; volume and purity of tone; sympathetic, elastic, and even touch; and durability of construction, which enables them to remain in tune much longer than ordinary Pianos.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.

Topics of the Day.

THE House Committee on Foreign Affairs is said to have been discussing some recent development of the Mexican question, and come to the conclusion that the Monroe doctrine must be sustained, so far at least as can be done by a decided moral support of the Liberal cause. Juarez seems to be supporting it by force of arms with far more efficiency than has been generally supposed. The letters of correspondents of all shades of opinion begin to give a very gloomy picture of the imperial prospects, but the action of our people and our Government in general has done not much to strengthen the hands of the Republican leaders, and the policy pursued of late by the State department has apparently done something to awaken them. Santa Anna's arrival, for instance, and the alleged good understanding between him and Secretary Seward, seem to have excited the jealousy of the Mexican minister, and, to all appearance, bode no good to the Republican cause and the Juarez party. It will be well if Congress gives some certain sign of the opinion held by the very great majority of the American people, which certainly, if it likes Maximilian not at all, likes Santa Anna and the Almonte party very little more.

ON the recommendation of the National Academy of Sciences, Congress passed recently a bill, which has since been approved by the President, providing for the issuing of a coin of the value of five cents, which shall supersede all paper fractional currency of a less denomination than ten cents. This coin is to be connected with the French metric system by its weight of five (Fr.) grammes, and its breadth of one-fortieth of a metre (39·37 in.). On Thursday the House passed promptly three bills providing that hereafter it shall be lawful throughout the United States to employ the weights and measures of the metric system; directing the Secretary of the Treasury to furnish each State government with a set of these standard weights and measures; and authorizing the President to appoint a special commission to negotiate with foreign governments for the establishment of a common unit of money, of identical value in all commercial countries which shall adopt it. These are very considerable strides in a direction towards which all Europe is tending, as we took occasion to show in No. 39 of THE NATION. England has gone so far as to legalize the metric system as the House of Representatives has just done; and it would be well if something like the action of the British Association for the Advancement of Science could be taken here. That body appropriated money to erect in conspicuous places mural tablets containing the metre and its subdivisions. Besides the most obvious conveniences likely to result from international agreement on the metric system, the aid that statisticians will derive from it is simply incalculable.

THERE seems to be a little hitch somewhere about Jefferson Davis's trial. It does not seem very clear whether the bill of indictment has been found against him with the view of getting him off scot free or having him punished, and there are mysterious disputes amongst the lawyers as to whether it will hold water or not when the trial comes on. In the meantime it is said or hinted that Chief-Justice Chase very properly hesitates about conducting a judicial proceeding of this character in a district still ruled by martial law, and that the President proposes to quiet his scruples by a proclamation declaring the civil courts to have exclusive jurisdiction in all things civil. With all deference to the parties concerned, we do not see how this would mend the matter. The civil law is either in force in Virginia or it is not. If it is, the President's proclamation is not needed to give the courts jurisdiction; if it is not, it is hard to see what the courts gain, either in security or dignity, by an order issued *ad hoc* and arbitrarily by the President. Suppose that, during the trial in Richmond, a case was to arise calling clearly for one of those displays of discretionary power to which the President is every week compelled to resort in other parts of the South, would he feel so far bound by his proclamation as to refrain from interference? This is the real question after all, and we know of no answer to it that can be called entirely satisfactory.

WE believe it is now no secret that a movement is on foot to procure the pardon of Ketchum, now confined in the State prison for the most extensive and perhaps least excusable batch of forgeries ever committed. There is hardly a crime to be found in the whole annals of fraud for which there was less to be said in palliation than his. And we do not know anything better calculated to encourage those lapses from honesty which have of late been so frequent amongst the young commercial men of this city than the extension to him of either mercy or indulgence. Moreover — and this is a still more important consideration—we know of nothing better calculated to shake the confidence of the poor in the administration of justice than the success of an effort made by rich men to save Ketchum from the fate he has merited, and everything which shakes this confidence is a public calamity. We trust that the governor will do his duty in this matter whenever it comes before him, and that all who profess a regard for either public or private morality will not only not sign any petition on the subject, but discourage others from doing so.

JUDGE ABELL, of Louisiana, has decided the Civil Rights Bill to be unconstitutional, on the ground that the two-thirds vote by which it was passed over the veto of the President was not the vote of two-thirds of the Senate, the members from the Southern States being absent. He also objects to it on the general ground that it is an exercise of power not conferred on the general Government by the constitution. He adds that he also refuses to be bound by it as an act of "duty to his State." A considerable portion of the decision is in the nature of a stump speech. It is valuable, however, as showing the course things will run in the South until the act has been passed upon by the Supreme Court of the United States.

THE lack of variety in our editorial pages to-day is plainly accounted for by the heavy demands upon our advertising columns.

THE commission named in a joint resolution of Congress to select a site for a Post-office in this city, has been approved by the President. We notice with satisfaction that Dr. Schultz, President of the Board of Health, is one of the number, because we trust that he will be disposed to secure that comprehensive consideration of all the changes in the present plan of the city and arrangements of business which ought to be had in connection with a change in the locality of the Post-office. We should, for instance, much regret to see any portion of that piece of waste ground called the City Hall Park taken for the purpose, unless such a change were at the same time made in the plan of all the area within the lines of buildings surrounding it, that a more convenient Post-office would be among the least of the advantages we should have to set off against the curtailment of the only ground in the interior of the lower part of the town where there is any chance of our holding a respectable breathing place for posterity. As we advance in civilization and this space is made available, by suitable improvements, for its proper use, its limited extent will be more and more regretted.

WE regard Mr. Donnelly's resolution, offered in the House of Representatives on Friday, and looking to the planting of woods and forests in the timberless plains of the West, as one of the most useful measures proposed this session. The planting would have an important effect on emigration, of course, and in the lapse of time would undoubtedly bring about alterations in the climate and temperature of those regions. We presume the Committee on Public Lands, to whom the resolution was referred, are familiar with Mr. Marsh's book on "Man and Nature;" but if they are not, they will find it a helpful guide in their enquiries, and an encouragement to report the necessary legislation.

THE relation between the gas companies and the public continues unchanged. The former have met with no success in their experiments, but are, they pretend, willing to adopt any plan which the Board of Health may suggest, or even to offer a considerable prize to any one who will prevent the escape of noxious vapors from their works. Perhaps the remedy, after all, is *Punch's* for the prevention of railroad accidents; and we suggest as a "plan" for the Board, that it should compel the directors to live in the area affected by the nuisance, and as near as possible to the gas factories; or, as the companies have an advantage over the public, since to suspend their operations is to darken the city, let the Board cut off the gas from the directors whose residences are in town, until the purity of the atmosphere bears some proportion to the purity of the companies' intentions, or until coal gas is superseded altogether by petroleum gas, according to the promises and expectations of a new corporation.

THE Spaniards have bombarded Callao and been beaten off, it is said, with heavy loss. It seems probable that this continued tide of disaster and humiliation will bring the Government at home to its senses, and put an end to one of the paltriest and most barbarous wars of the century. Five years ago Spain seemed reviving; judging from the events of the present year, there are still lower depths awaiting her.

THE news from Europe will now be awaited with considerable anxiety, as it is reasonable to look by every mail for the outbreak of hostilities in Italy. The last steps taken by the Italian Government were of such a nature as to leave very little doubt that it counted confidently on the co-operation of Prussia in an attack on Austria. Whether Prussia draw the sword at once or not makes for the moment very little difference to Italy. As long as she threatens to do so, Austria will be compelled to keep the bulk of her army in Germany, leaving Italy tremendous numerical odds on the Po. But then the famous "Quadrilateral" may, with all the garrison Austria can throw into it, defy everything but a blockade. A blockade is tedious, and time is now the worst enemy of Italy. Her army is enormous, her finances in a condition little short of desperate, and her people are in one of those excited moods in which failure is apt to breed despair. It remains to be seen if the new nation has acquired during its six years' independence that magnificent indifference to immediate results, and magnificent faith in the future, without which no great struggle was ever yet carried to a successful issue.

CONGRESS.

WASHINGTON, May 19, 1866.

EVERY one will be glad that a bill has received the sanction of Congress for the revision and consolidation of the laws of the United States. These statutes at large now make twelve ponderous volumes in octavo. It is thought that by omitting the obsolete statutes, and codifying the remainder, our national law may be compressed into a single volume of quite portable dimensions.

The recent debates in the House upon the constitutional amendment were notable for the superior spirit and condensation of the speeches, in most instances. This praiseworthy result is attributable simply to the adoption and strict enforcement of the half-hour rule. If the rule could only be made universal, our Congressional eloquence would speedily gain in quality what it would lose in quantity—a consummation devoutly to be wished.

The tug of war upon the reconstruction amendment begins in the Senate on Monday. There will be no flinching from the rugged issue in that body, though it may be that some amendment of the disfranchisement clause will be carried, in the hope of presenting a cleaner issue to the people.

DIARY.

May 16.—In the Senate, a bill was offered to transfer the Indian Bureau from the Department of the Interior to the War Department. The consular appropriation bill was debated and amended.

In the House, a bill was passed to provide for the safety of the lives of passengers on board steam vessels. Several private bills were passed, and the tax bill was discussed in detail and amended.

May 17.—In the Senate, a bill was passed to punish the carriage of nitro-glycerine by passenger vessels. Also, a bill granting lands in aid of a railroad from California to Oregon. The consular and diplomatic appropriation bill was passed. The West Point Military Academy appropriation bill was passed, after striking out the clause prohibiting appointments of cadets from the rebel States, and inserting a prohibition of the appointment to the Military or Naval Academy of any person who served in the army of the rebellion.

In the House, a bill was passed providing that it shall be lawful throughout the United States to employ the weights and measures of the metric system. Also, a resolution authorizing the appointment of a special commissioner to facilitate the adoption of a uniform coinage between the United States and foreign countries. The tax bill was debated and amended.

May 18.—In the Senate, the day was spent on the pension laws and private bills.

In the House, the Senate bill to punish kidnapping for the purpose of enslaving was passed. Mr. Schenck reported, from the Committee on Military Affairs, a bill to equalize the bounties of soldiers. The remainder of the day was spent on the tax bill and on District of Columbia business.

May 19.—The Senate did not sit. In the House, speeches on the state of the Union were made by Messrs. Morris, Patterson, Newell, and Ross.

THE FREEDMEN.

IN the conferences which Generals Steadman and Fullerton are holding with the colored people in their tour through the South, there is a uniform desire expressed by the latter for the retention of the Bureau, whose officers are generally approved as well-meaning and upright. At Wilmington, when General Steadman asked whether they would prefer that the Bureau or the troops should be withdrawn, they answered unanimously, the troops. Among the obvious reasons for this choice, the privilege of schooling was not the least. At Norfolk, one of the committee (four or five are usually selected for convenience as spokesmen) was asked by the same General: "The duties of the Bureau must be turned over to the civil courts; had this better be done while the military remain?" He replied: "I think it best to get the Virginia courts in the habit of doing us justice *now*, while the military are here; *then* it will be much easier for them after the military are withdrawn." And General Steadman said: "I think your proposition a very sensible one."

—Capt. Geo. O. Glavis, formerly a U. S. A. chaplain in the military hospital at Newark, N. J., has written a letter from Goldsborough, N. C., to Secretary Stanton, refuting certain charges against himself contained in the report of Generals Steadman and Fullerton as published in the New York *Herald*. Their personal examination of him did not last longer than ten minutes, and the company they kept, while in town, he thinks was not favorable to impartial or exact conclusions about the workings of the Bureau.

—The two commissioners have reached Savannah. They are reported to have detected frauds in the Sea Islands on the part of planters, who, for instance, charge their hands $3 a bushel for corn which cost but thirty cents.

Notes.

LITERARY.

The late election to fill the chair of M. Dupin in the French Academy resulted in the choice of M. Cuvillier-Fleury. Only two other candidates were proposed, M. Henri Martin, author of the well known history of France, which has several times been crowned by the Academy, and Count Franz de Champagny, the author of a history of the Cæsars which is favorably criticised in the last number of the "Dublin Review," of the school of Montalembert, and once editor of the "Revue Contemporaine." Champagny was supported by *Le Constitutionnel*, but received only one vote, that of Lamartine. Eleven voted for Martin, including Cousin, Feuillet, Legouvé, Merimée, Mignet, and Sainte-Beuve, while Cuvillier-Fleury had twenty votes, the most noteworthy of his supporters being Guizot, Montalembert, Prévost-Paradol, and Villemain. Thiers would have voted for Martin, and Berryer for Cuvillier-Fleury, but both were kept away by their duties in the Corps Législatif. The rule which prescribes that the choice of the Academy must lie between those men only who have gone through a formal candidature and have made personal visits to each member to solicit his suffrage, often works injury to the reputation of the Academy, when, as in this case, no persons of great merit are willing, of their own motion, to undergo the ordeal of a candidature. Modest merit is left in the background, and eminent scholars and writers are passed by. Few men are willing to try again after one rejection, unless sure of success. Alfred-Auguste Cuvillier-Fleury was the preceptor and secretary to the Duc d'Aumale, and was for many years one of the chief writers on the staff of the *Journal des Débats*. Several of his sketches of men and manners during the later years of the reign of Louis Philippe have been collected into volumes. In 1851 he published "Portraits Politiques et Révolutionnaires," and in 1854, "Etudes Historiques et Littéraires." His success was owing to his legitimist principles and to his connection with the *Journal des Débats*, a large force of the writers for this paper having preceded him to the Academy. By the death of Clapisson a seat in the Académie des Beaux Arts is vacant. Gounod, Felicien-David, Massé, and Maillard are mentioned as the candidates.

—"Les Apôtres," the second volume of Renan's History of the Origin of Christianity, has been published in France, and the first part of a German translation is also out. In an introduction of some length the author defends himself against the cross-fires to which he has been subject, and explains the system on which he has proceeded in the present volume. A new edition of the "Vie de Jésus" will shortly be issued, with an appendix containing a detailed reply to his antagonists and a full statement of his reasons for accepting the fourth Gospel as genuine. "The Apostles" contains the Christian history from 33 to 45 A.D., from the death of Christ to the chief mission of St. Paul. A third volume, "St. Paul," will complete the work. The most remarkable portions of this volume, in a literary point of view, are the description of Antioch in the twelfth chapter, and the whole of the seventeenth chapter on the state of the world about the middle of the first century. This chapter is said to have given great offence to the French liberals, on account of the statements concerning freedom of thought and action under the Empire and the reflections on the influence of absolute power on philosophy and literature. It is so customary for certain persons in France to see a modern allusion in every book touching on Roman affairs, that truths as evident as these cannot be stated without bringing on the writer accusations of Cæsarism and of an attempt against liberty. The sale of "The Apostles" is, of course, not so large as that of the first volume, which fact is wittily explained in *L'Evénement* by the old proverb, "Il est mieux de s'attaquer au bon Dieu qu' à ses saints."

—A very remarkable literary imposture has just been discovered and exposed in England. A MS. journal of travels, purporting to be written by George Ludwig von ——— (the name had been carefully erased), was found in 1859 in the archives of the Military Topographical Dépôt at St. Petersburg. The German traveller professes to have been employed by the East India Company early in the present century (the MS. is dated 1806) to purchase horses for the use of the army. Starting from Srinagur, the capital of Cashmere, on the 8th of May, on the 9th he passed in sight of an active volcano, Darumudan; on the 10th crossed the Indus, and reached Kashgar on the 12th of June. Here he bought 132 horses and despatched them to Bengal with Lieut. Harvey and eight Sepoys. The lieutenant and the Sepoys were murdered on their way by Mahrattas. He, himself, travelled about the little known of regions and visited Khokand, Turkestan, and Samarkand, but, finding his exit to the north impeded by the Kirghiz tribes, he returned after about a year's absence to India. A dispute arose with the East India Company in regard to the payment for the horses that had been captured, and as a result his journal was offered and sold to the Russian Government. The MS. is elegantly written, accompanied by forty sketches of the country and numerous tables of astronomical positions. A translation into French was also found, with several maps of the regions visited. The work is very circumstantial, giving full details about the inhabitants productions, and physical features of a country then entirely unknown, and even now rarely visited in some parts by Europeans. The faithfulness of the journals deceived the Russians, and it was made the basis of their official maps as well as of those of Kiepert of Berlin, and Stanford of London. A memoir on the Pamir region, by Veniukof, published in the journal of the Imperial Geographical Society in 1861, first brought it to the knowledge of English geographers. Sir Henry C. Rawlinson investigated the subject and made his report at a recent meeting of the Royal Geographical Society. Numerous statements in the baron's journals were at once seen to be improbable and untrue—the whole description of Kashgar, which has since been often visited; the alleged volcano in a country which shows no traces of volcanic action, and the fact that few names correspond to the present names of the places mentioned. The impossibility of performing the journey to the Indus in two days and to Kashgar in twenty-five days was at once fatal to the narrative. There are no horses in those mountainous regions but ponies, unfit for cavalry service; and no Lieutenant Harvey was known to be in the East India Company's service at that time, neither is there any record of such journeys or expeditions. Indeed, it would have been perfectly impossible at that time to have traversed as peaceful travellers, with instruments and note-books, countries which even now are very dangerous. There seems no doubt, after Sir H. C. Rawlinson's investigation, that the whole journal is an ingenious hoax played on the Russian Government, which has always been eager for details with regard to Central Asia, and was especially so in the early part of this century, during the alliance between Alexander I. and Napoleon.

—Among recent books on art history and criticism the "New History of Painting in Italy from the Second to the Sixteenth Century," by J. A. Crowe and G. B. Cavalcaselle, holds a very important place. The third volume of this work has just been issued by Murray. It contains the painters of the earlier part of the sixteenth century, beginning with Luca Signorelli, famed for his anatomical knowledge, and ends with Andrea del Sarto, who died in 1531, "a little fellow," said Michael Angelo to Raphael, "who will bring sweat to your brow if ever he is engaged in great works." Perugino and Frà Bartolommeo fall within the limits of the volume. The indexes, illustrations, and catalogues of pictures are elaborated with very great care, and for its trustworthy narrative and its sound criticism the book is of great authority. Messrs. Smith, Elder & Co. have just published "A Century of Painters of the English School, with Critical Notes of their Works and an Account of the Progress of Art in England," by Richard and Samuel Redgrave. Mr. Richard Redgrave is a Royal Academician, and is the surveyor of Her Majesty's pictures and inspector-general for art. "Essays on Art" is the title of a little book by Mr. Francis Turner Palgrave, a collection of newspaper criticisms, published chiefly in the "Saturday Review." They have all been revised and some rewritten, and are not so open to the charge of having "a note of provinciality" as was the hand-book which Mr. Matthew Arnold alluded to in his essay on the "Influence of Academies." This book is worth reading, as giving a sketch of contemporary English art by a sympathetic, though not always trustworthy, critic. The principal papers are on the three last exhibitions of the Royal Academy, on Mulready, Dyce, William Hunt, Holman Hunt, Madox Brown, Triqueti's "Marmor Homericum," and "Sculpture in England." Revised and rewritten criticism, such as is contained in this book, rightly bears the motto from Sainte-Beuve, "C'est à ce lendemain sévère que tout artiste sérieux doit songer." This book is announced for republication by Hurd & Houghton. M. Taine has given us the first instalment of his critical survey of Italian art in "Voyage en Italie," the first volume of which is out. It is a portion of the articles entitled "L'Italie et la Vie Italienne," now being published in the "Revue des deux Mondes," and includes criticisms on the art works of Naples and Rome, as well as some very suggestive accounts of Italian life and thought.

—Several new books of interest are announced in England: "The Crown of Wild Olive, Three Lectures on Work, Traffic, and War," by Mr. Ruskin; "The Albert Nyanza, Great Basin of the Nile, and Explorations of the Nile Sources," by Samuel White Baker, with numerous maps and illustrations a new translation of "Homer's Iliad," by Sir John Herschell; the Globe edition of the poetical works of Sir Walter Scott, with a preface by F. T. Palgrave; the second and concluding volume of Miss Meteyard's "Life of

Wedgwood;" "The Memoirs and Correspondence of Field Marshal Viscount Combermere;" and a new story by the author of "Adam Bede," to be called "Felix Holt, the Radical," the scene being laid in the Midland counties during the excitement of the Reform Bill agitation.

—"Superstition and Science" was the subject of a lecture recently delivered by Prof. Charles Kingsley before the Royal Institution in London. In his analysis of the subject, Mr. Kingsley considered fear as the sole cause of superstition, which he confined within its narrowest limits, disregarding entirely wonder and imagination. The lecture was especially felicitous in its illustrations, but displayed all of the lecturer's old faults in analysis and treatment.

—The second volume of the Emperor Napoleon's "Histoire de Jules César" was to be published in both French and English on the 8th of May. It embraces the Gallic wars and extends to the passage of the Rubicon, with which it closes. This volume shows the important results of the numerous and extensive surveys and excavations made on the sites of Cæsar's battles and camps, especially at Alise (Alesia) and Puy d'Issole (Uxellodunum). The volume is accompanied by an atlas of thirty-two maps and plans. After detailing the Gallic wars, the Emperor gives a summary of the events and intrigues at Rome which ended in the elevation of Cæsar. The analogies which were thought to be seen in the first volume, between the state of Rome and France, are still further drawn out by the present volume, and the author acknowledges them in the foot-notes by reference to his own accession to power.

SCIENTIFIC.

Uses of Magnesia.—Apart from the interest which necessarily attaches to it as being the source of the metal magnesium, which is latterly coming into somewhat extensive use in the arts of pyrotechny and photography, magnesia is now attracting considerable attention in view of its great refractoriness as regards fire, and of the fact that it is capable of hardening, like hydraulic cement, when mixed with water.

Very strong and exceedingly infusible crucibles are now made in Paris, for scientific purposes, by compressing magnesia, and these bid fair to supersede for some purposes the lime crucibles which have been in vogue there during the past ten or twelve years. The magnesian crucibles are readily made and possess one very great advantage over lime crucibles in that they may be kept for a long time in the air without undergoing change. Even after they have been exposed to moist air for months, it is only necessary to heat them slowly in order that they may be used without trouble. Magnesia and lime resemble one another in that they are not prone to form fusible slags by uniting with oxide of iron; and in this respect they both differ essentially from silica, which is the predominant ingredient in ordinary crucibles and fire-brick. The suggestion has been thrown out in this connection that bricks made of magnesia would be valuable as material for the floors of puddling furnaces, since it is probable that the magnesian bricks would resist much longer than the usual silicious materials that solvent action of oxide of iron to which the linings of these furnaces are so much exposed. The cost of magnesia, which is now about fifty dollars the ton in Paris, must, however, prevent it from coming immediately into any very general use for metallurgical purposes.

Another property of magnesia, which is likely to find important technical applications, has recently been brought prominently into view by H. Deville. In this case, as in so many other previous instances, the observations of this acute chemist have thrown a flood of light upon several empirical facts and methods in chemical technology which have hitherto been exceedingly difficult of comprehension. It is a familiar fact that the common, light, powdery "calcined magnesia" of the apothecaries, which is prepared by heating the hydrous carbonate, yields no very tenacious product upon being moistened with water. But the more compact variety of magnesia, obtained by calcining the nitrate or chloride of magnesium at a bright red heat, possesses remarkable hydraulic properties. When wet it quickly combines with a portion of water, increases somewhat in bulk, and is converted into a crystallized hydrate of remarkably compact texture and of great durability. This hydrate is somewhat harder than marble, and is equally heavy and tenacious; when in thin layers it is translucent, like alabaster.

In preparing this magnesia very high temperatures must be avoided, for its hydraulic properties would be thereby impaired. After magnesia has been exposed to a white heat during ten or twelve hours, its hydraulic qualities seem to be well-nigh destroyed; for if this superheated product be reduced to fine powder and mixed with water it will not "set," and it will now harden only slowly when left for weeks exposed to the air.

A mixture of equal parts of the hydraulic magnesia and of chalk, or powdered marble, made into paste with water, yields a slightly plastic mass which admits of being readily moulded, and which, upon being placed in water, becomes after a time extremely hard and compact. By means of it M. Deville expects to be able to obtain busts, bas-reliefs, and like objects, in artificial marble, by casting; the hydraulic magnesian mixture being simply poured or pressed into appropriate moulds. One very important practical observation, to which the study of these mixtures of the hydraulic magnesia and marble directly led, relates to the degree of heat which ought to be maintained in the kilns in which dolomites or magnesian limestones are burned. It has long been known that many dolomites yield upon calcination hydraulic cements, though these products have generally been held in comparatively little esteem. But it now appears that if dolomites, tolerably rich in magnesia, be calcined at temperatures sufficiently low, there will be obtained products which rapidly "set" under water, and are converted into stone of extraordinary hardness. In Deville's trials the dolomite was heated to temperatures below redness, say to 600° or 700° Fah., these temperatures being, of course, very much lower than those of an ordinary lime-kiln. By this treatment the carbonic acid of the magnesia is alone expelled, while that which is in combination with the lime remains intact, or but little disturbed. After this gentle calcination there is really left a mixture of hydraulic magnesia and marble, such as has been mentioned above. In the final hardened product the particles of carbonate of lime will be found unaltered, precisely as in the stone prepared from artificial mixtures of magnesia and marble. If the dolomite be heated to temperatures somewhat higher than those given above, so that a small quantity of quick-lime is produced in the mass, the product will still be capable of "setting" under water, but when a pure dolomite is heated to redness the carbonic acid is all expelled from the lime as well as from the magnesia, and upon treating the product with water it will slake at once and fall to powder.

From some experiments made by Culvert, it appears that where a dolomite rich in magnesia contains also a considerable portion of silica, this last will combine with the lime and render it harmless. Silicious dolomites, then, may be heated even to redness and still yield products which are hydraulic; the hydraulic effect being in this case increased, according to Culvert, by grinding the product to fine powder immediately after the calcination.

Frost Figures.—A certain Herr Schulz, of Hamburg, has hit upon the curious idea of seizing, as it were, and rendering permanent the beautiful pictures which are formed by the deposition of hoar-frost upon our window-panes in cold weather. His experiments are interesting from a scientific point of view, as going to illustrate the power possessed by bodies in the act of crystallizing of enclosing, and even transporting, extraneous matter. In order to fix the frost picture, there is first sifted, through a fine hair sieve, onto an ordinary pane of glass a very thin layer of finely powdered enamel; the pane is then placed upon a thick plate of iron, which is cooled to a temperature of about eighteen degrees above zero. The whole thing is then thrust into a space filled with aqueous vapor. The vapor at once condenses upon the cold glass and forms frost pictures, the powdered enamel being at the same time taken up by these mechanically, so that the enamel-powder is arranged in the same forms as the particles of ice. The frost figures enclose enamel figures of precisely the same form, the enamel being in some sort the skeleton of the crystals, of which the hoar-frost is the flesh. The pane being now carefully warmed and dried, the enamel figures will still remain after all the water has been expelled, and on heating the glass to redness in a muffle furnace, the enamel can be burned into the glass; so that, as the final result, there will be obtained a transparent pane covered with representations of the frost figures done in enamel.

Coloring Matter of the Emerald.—Of late years doubts have arisen among chemists as to the cause of the beautiful green color of the emerald. After Vanquelin had detected the presence of oxide of chromium in specimens of emerald examined by him in 1797, and after the discovery of the fact that this oxide is capable of imparting a green coloration to vitreous substances, it was everywhere naturally admitted that oxide of chromium must be the coloring matter of the emerald. But in 1858 this view was contradicted by Lewry, a Danish chemist, resident in Paris, who, in an elaborate essay upon the occurrence and composition of the emerald of Muso, in New Granada, advanced the idea that the color of the emerald is not due to oxide of chromium, but is dependent upon the presence of a certain organic substance. According to Lewry the emerald becomes colorless upon being ignited Finding his last assertion to be incorrect as regards emeralds from other

localities, G. Rose and Wöhler have taken the trouble to re-examine the whole subject. They have subjected to careful analysis emeralds from the very locality from which the stones mentioned by Lewry were derived, and have found that these do not lose their green color upon being ignited; and as the final result of their investigation they have reached the conclusion that the green color of the emerald is, after all, really due to the presence in the stone of small quantities of the oxide of chromium.

A TOUCHSTONE FOR MASSACHUSETTS.*

We know no law for specialties and hobbies, nor, as we opine, is the human mind accountable for its choice of pursuits, however eccentric that choice may appear. It is as difficult to appreciate investigations for which we have no sympathy, as it is to explain the attractions which they had for men who were willing to exhaust their lives upon them. What is essential is, that this liberty of selection should continue and be respected, and that we should trust that in the divine economy no diligent enquiry will be wasted, though it concern itself with the leg of a fly or with a lacuna in the chorus of a Greek tragedy. The field of historical research is, for our short existence, both unlimited and illimitable; and as the past is never weary of giving up its dead, the record of the race is little better than a palimpsest, on which the writing of one generation is obliterated by the writing of the next, which in turn is destined to be buried under that of the third, and so on *ad infinitum*. In short, history is judgment subject to perpetual appeal, and the appellants, conscious and unconscious, are legion. The world sometimes finds them bores, sometimes disturbers of the peace. There are delusions which it is not comfortable to have detected. Why must Prof. Masson expose the daughters of Milton to be not the "rapt and reverential" scribes whom novelist, painter, and engraver have made a familiar group for us, but such unfilial creatures as to pawn their father's books, and to anticipate wistfully the arrival of his undertaker? Why must the French Emperor filch Cæsar from our list of despots, and insist on classifying him among the philanthropists? Why must Mr. Moore——— But we were about to beg the question.

Mr. Moore would, if interrogated, undoubtedly profess that religious regard for historic truth which inspires the Imperial biographer. He is careful to apologize at the outset that there is nothing in his book "to comfort pro-slavery men anywhere;" and he uniformly makes use of language which would exclude him from such disreputable company. But it is one thing to entertain sound convictions, another to write in a spirit attributable to the very opposite, and the lameness of the author's defence consists in his inability to see that these two things are perfectly compatible. His conclusions will, of course, comfort the enemies of emancipation, and so, also, we can assure him, will those secondary motives for which he has not chosen to account —an apparent jealousy of New England's pre-eminence and an aversion to Puritanism. These supply the bias which he lacked as an abolitionist or even as an antiquarian—and he is the latter more than an historian—so that he seems less anxious to obtain the simple facts about slavery in Massachusetts than to prove that the good name hitherto borne by that State is not only not rightfully hers, but ought to be exchanged for one in an equal degree infamous. It is to this end that he controverts Mr. Sumner, who declared, in 1854, that "no person was ever born a slave on the soil of Massachusetts," and "if, in point of fact, the issue of slaves was sometimes held in bondage, it was never by sanction of any statute law of colony or commonwealth;" and Mr. Palfrey, who repeats that "in fact, no person was ever born into legal slavery in Massachusetts."

According to Mr. Moore, "the first statute *establishing* slavery in America is to be found in the famous Code of Fundamentals, or Body of Liberties of the Massachusetts Colony in New England—the first code of laws of that colony, adopted in December, 1641." In order to show how he justifies this statement, we will quote the 91st section as he prints it:

LIBERTIES OF FORREINERS AND STRANGERS.

91. There shall never be any bond slaverie, villinage or captivitie amongst us unles it be lawfull captives taken in just warres, and such strangers as willingly selle themselves or are sold to us. And these shall have all the liberties and Christian usages which the law of God established in Israell concerning such persons doeth morally require. This exempts none from servitude who shall be Judged thereto by Authoritie.

This code was not printed till 1648, and the second printed edition of 1660, with subsequent typographical emendations, retains the foregoing section, differing notably only as follows: For the title, "Bond-slavery" was substituted, and the sentence after "just warres" was made to read: "or such as shall willingly sell themselves, or are sold to us." That is, the word "strangers" was omitted; designedly, as Mr. Moore insists, and with the effect of removing "the necessity for alienage or foreign birth as a qualification for slavery," and taking off "the prohibition against the children of slaves being 'born into legal slavery in Massachusetts.'" He adds, that the code "sanctions the slave-trade, and the perpetual bondage of Indians and negroes, their children and their children's children."

Had he confined himself to using the word "sanction," our difference with Mr. Moore would not have been fundamental; but elsewhere he has chosen to assert—and his argument hinges upon it—that slavery was "established" by the statute quoted. We shall remark, on the contrary, that the system arose naturally in Massachusetts, and in conformity to the then laws of conquest, when one of the parties to a war belonged to a "heathen" or, as we have since chosen to call such, an "inferior" race; that it began with the captured Indians, some of whom, like the Pequods, being troublesome to keep and not attempered to servitude, were shipped to the Bermudas and swapped for the negro slaves already there; that the publication of the code in question found Indian and negro slavery and the African slave trade already in existence, and provision was made that they should not be disturbed; that the code did not enumerate certain persons or classes who could only remain in the colony in a servile condition and must on no account be admitted to freedom; and that the construction of the disputed 91st section, even without the aid of the original draft, strictly pertains to a trade *from without*, and not within, the colony, and can only be distorted to sanction hereditary bondage. And believing that this is what Mr. Sumner and Mr. Palfrey both mean when they speak of being "born into *legal* slavery," we agree with them, although it is true that the issue of slaves were held as slaves, and probably by the Civil Law, which holds that *partus sequitur ventrem*, as well as by the prevailing custom in all the British colonies. The Code of Fundamentals "established" slavery and the slave trade in the same sense that the United States Constitution afterwards established them, and in no other.

It is probable, however, that one born a slave would have found it difficult, in the early days, to escape from service by appealing to the law. In 1783 the Legislature instructed the committee to report a bill "declaring that there never were legal slaves in this Government," and in 1796 Chief-Justice Dana instructed a jury that a native negro born before 1780 was of right born free; but in 1799 the same court gave a directly opposite decision. It is noticeable that the petitions of slaves were entertained by the Legislature, and their suits were admitted into the courts. What we observed on a former occasion, in reviewing the history of religious liberty in Massachusetts, is also apparent here: that the courts were more liberal than the General Court, and were the efficient agencies in abolishing slavery. How this overthrow was brought about, in reliance upon the preamble to the Bill of Rights of 1780, we have not space to describe. The judges willingly discovered an intention which was probably far from the thought of John Adams, who framed the Bill; and after the case of Quork Walker *vs.* Nathaniel Jennison, in 1781–2, no one who chose to be free needed to be bound in Massachusetts. Slavery was so clearly doomed that no strenuous effort was made to preserve it, and if no formal attempt to pronounce it abolished succeeded, it was perhaps in good measure for the same reason.

We are indebted to Mr. Moore for many interesting facts and important documents. In 1659 the General Court ordered two Quaker children, Daniel and Provided Southwick, to be sold, for non-payment of fines, to Barbadoes; but nobody was found willing to carry them thither. There was the usual prohibition of trading with negroes, and of manumission without a guaranty of support for the freedmen. There was, even in 1788, a vagrant law expatriating negroes, but it could not be enforced in 1800 under the stimulus of Gabriel's insurrection. Yet it was not repealed till 1843. The first census in Massachusetts was of negro slaves. When the census ordered by the United States was being taken in 1790, the marshal of the district was generally answered that there were no slaves; and when some professed to be slave-owners, he would ask if they meant to be singular, and, as they concluded not to be, no slaves were returned for any part of the State. The reverses of the Revolution were necessary to make the blacks acceptable as soldiers, as in the later experience of the rebellion. They were not by statute placed upon the footing of white citizens in regard to militia service till 1863. A Constitutional Convention in 1778 excluded negroes from the ballot, but the people voted down the constitution thus vitiated. James Somerset, the subject of Lord Mansfield's famous decision, was a negro slave from Massachusetts. The historic connection is a pleasing one, even after the statement of Lord Mansfield himself "that his decision went no farther than that the master cannot by force compel the slave to go out of the Kingdom."

ADRIFT IN DIXIE.*

Lieut. Henry L. Estabrooks, of the Twenty-sixth Massachusetts Volunteers, was unlucky enough to be one of the two or three hundred prisoners captured by Early at the battle of Sept. 19, 1864, and at the close of the day was, in company with that general, sent "whirling through Winchester." A week later the young Union officer was herded with many other companions in misery in the Libby Prison, at Richmond; whence, in the beginning of October, he was transferred to a train on the Danville Railroad, to be conveyed to some more infamous place of imprisonment in the far South. A few miles north of Danville he succeeded in escaping from the train, and after a month of painful and hazardous travel, the incidents of which were scarcely less exciting than the creations of the novelist, reached the Union lines near City Point. Part of this journey was made in a dug-out down the Dan River to its confluence with the Staunton at Clarksville, from which place he travelled on foot to his destination, traversing the heart of that portion of southern Virginia which lies east of the Alleghany Mountains. Upon reaching home, Lieut. Estabrooks wrote out from recollection a tolerably full narrative of his escape, which is embodied in the book before us. It is such a plain, unvarnished tale as a man who has endured a month of perilous adventure and constant excitement would indite while the incidents are still fresh in his mind; and it is apparently told in nearly the same form and language as when first related at the family fireside. As a record of singular coolness, sagacity, and endurance in a young man, the volume will attract attention, and none will doubt that the author well deserved the liberty which was the reward of his trials; but to a large class of readers its chief interest will consist in the accounts it presents of the feelings, disposition, and moral and intellectual development of the negro population of southern Virginia. These, from the simplicity of the narrative and the homely directness of the style, seem thoroughly trustworthy, and must prove a valuable addition to the evidence bearing on the same subject already collected.

Of several hundred colored men and women whom Lieut. Estabrooks encountered on his journey, not one refused him sympathy; scarcely one declined to add substantial aid to that sympathy, some even offering him money; and he heard of but one who would be likely to betray him. Go where he would, he found the colored people, bondmen or free, in general well informed of the character which the war had by that time assumed, and able to distinguish between friend and foe. So fully did they seem prepared for just such occurrences as the escape of Lieut. Estabrooks, that his sudden appearance at their cabin doors at night, or at lonely places in the day time, caused little or no surprise; but, on the contrary, often developed a degree of sagacity and presence of mind in them to which on more than one occasion the young officer probably owed his life. In two or three instances only, from pure physical fear, colored men showed reluctance to secrete him or guide him on his way; and, considering the severity of the punishment which awaited them if discovered, it will be admitted that they had reason to hang back. But this only adds to the heroism of those who braved the risk of torture or death to aid the Yankee officer, of whom they knew nothing but that he was their friend. It has been customary to extol the fidelity and courage of the English royalists who harbored, at the risk of their lives and fortunes, the fugitive Charles Stuart when beset by his Roundhead pursuers; or of the Scottish Highlanders who, nearly a century later, performed the same office for another of the same family. In either case it was the foremost man in the realm for whom the risk was encountered. Should he escape, glory, honor, and riches, perhaps, awaited those who had befriended him; and, should they be detected, their punishment, according to the exaggerated notions of loyalty then fashionable, would reflect no less glory on themselves and their kindred. In place of an anointed king, substitute an obscure and needy fugitive, of whom nothing is known beyond the information afforded by himself, whom it is perilous in the extreme to succor, and for the succor of whom no more substantial reward than his gratitude may be expected, and it will be seen how much brighter shine the acts of the ignorant and oppressed pariahs of the South than those of English or Scottish royalists. Lieut. Estabrooks's case was not a peculiar one. Hundreds, if not thousands, of Union fugitives were aided in a similar manner by Southern slaves, but we have nowhere seen their services more directly and, it may be said, more unconsciously set forth than in the unpretending little volume before us; and it seems scarcely credible that any loyal man could arise from the perusal of it without feeling that the debt of gratitude to the colored people of the South has not yet been fully paid. If the negroes of Virginia may be supposed to fairly represent their class, the freedmen possess a degree of intelligence, courage, and devotion entitling them to a higher reward than mere freedom from bondage The volume is edited by Edmund Kirke, who has furnished an introduction, although from the lettering on the back it might be supposed that the whole work was his production.

* "Adrift in Dixie; or, A Yankee Officer Among the Rebels." New York: Carleton·

PARIS GOSSIP.

Paris, May 4, 1866.

So precocious a season as the present is not paralleled in the memory of "the oldest inhabitant." In some parts of foggy Albion the hay is already being carried; wheat and rye are nearly ripe in Belgium; here, strawberries have descended from the Olympian regions of the shop-windows of Cheact, Aubert, and their rivals, to those of ordinary greengrocers; and green peas are being hawked through the streets by itinerant venders. Asparagus has not yet descended quite so low, and is still too dear for any but well-filled purses; but it is of magnificent quality, and very large, though not quite rivalling its wonderful Brazilian congener—a yard long, thick as a man's arm, and edible down to the very root—which one wonders that no enterprising friend of humanity, in these days of acclimation, has yet bethought him of introducing into Europe. The following choice bit of French-English, extracted from the bill-of-fare book of one of the great feeding-places of the boulevards (which book, for the convenience of English customers, has just been translated into what is supposed to be the insular vernacular), shows both the progress of internationality in this region and the delicacies most in vogue at the present moment:

"Bill of Fares.—Patty of fatgoose's liver with truffles; soup with smashed chesnuts.—*Fish.* A Thornback with butter which is black.—*Entrées.* Four chops with asparagus tops; a blanket with mushrooms; trotters to a pullet.—*Roast.* A chicken of the year to small peas; asparagus hashed to little points; gelly whipt to a Russian.—*Dessert.* Strawberries, at will; conserves."

The month of May being dedicated, in Catholic countries, to the Virgin Mary, services in her honor are being held in all the churches, with choruses of sacred music sung by young girls dressed in white and blue, the Virgin's colors; the only occasions in which, according to the gallant traditions of the Romish ritual, female voices are allowed to take a recognized part in the services of the altar. All the children bearing the name of 'Marie' are considered as being placed under the special protection of the Virgin, and devoted to her service; very devout mothers of girls so named make it a point (if they can afford the great extra outlay thereby involved in the way of washing-bills) not to allow them, until they reach their fourteenth year, to wear any article of clothing other than white, with, perhaps, a few blue ribbons by way of ornament, and girls so named always choose the Virgin's chapel to say their prayers in, and are married therein when their "ascendants" have duly chosen a husband for them.

The annual fine art exhibition is just opened in the Industrial Palace of the Champs Elysées. The gathering is not considered as being exceptionally fine, but the crowds who there do congregate exceed in number those of previous years. As the Emperor and Empress go frequently to these exhibitions, and buy largely, it has become fashionable to spend an hour or two daily in the interminable galleries of the upper story of the structure which contained the international glories of 1855. It is said that the Government would be glad to sell this vast and costly building, if it could find a purchaser. The yet larger and more pretentious structure, at Auteuil—intended as a permanent industrial exhibition of all the products of the world—is also in the market, and seems likely to remain there indefinitely, to the sad disappointment of the unhappy shareholders, who have long ago renounced the brilliant prospects of gain held out to them in the beginning of the speculation, and would now be devoutly thankful to get back even a fraction of the money invested.

A good many splendid entertainments have been given during the last few days, the most remarkable being the great ball given by the Duke and Duchess of Bisaccia, in their magnificent Hôtel de la Rochefoucauld, and the dinner given to the Emperor and Empress by the young Duke and Duchess de Mouchy, followed by a *soirée dansante*, to which only a few spoonfuls of "the cream of the cream" of the fashionable world had the joy of finding themselves invited. Princess Clothilde, Princess Mathilde, the Crown Prince of Denmark, and some of the princely relatives of the young hosts, were alone invited to the dinner, which is said to have been a miracle of good taste and splendor, and at which, the affability of the two principal guests putting all the others at their ease, the conversation was as merry and animated as the cheer was *recherché*. The relatives of the duke were, at first, terribly shocked and scandalized at the prospect of a Noailles disgracing his illustrious lineage of heaven-knows-how-many cen·turies by an alliance with the mushroom ex-royalty of the Murats; and all

of them, with the exception of a sister of the late duchess and her two sons, made it a point of honor not to show themselves in the chapel of the Tuileries at the celebration of the marriage. On the return of the young couple from their honeymoon of ten weeks at the fine old Château de Mouchy, much curiosity was felt as to the sort of reception that would be accorded by the haughty representatives of a past *régime* to the charming granddaughter of the ex-King of Naples, when, in accordance with Paris custom, she made, with her husband, the usual round of wedding calls. The young duke had allowed it to be known that his mind was very decidedly made up on one point, viz.: that whoever of his relations or friends should be "not at home" when he brought his bride to their door should be erased from the "red-book" of the Hôtel de Mouchy for the remainder of his tenancy of that magnificent heirloom of his race. This decision appears to have had its desired effect; for during the week devoted by these young favorites of fortune to making their appearance before the greater part of the grandees of the "aristocratic faubourg," not one soul is said to have been "out" at the time of their call. Many of these sulky contemners of "the Revolution" must have winced a little at the idea of the grand Mouchy gala carriage, its stately coachman, and its lofty lackeys, bringing into the courts of their hotels the Imperial colors and liveries which the bridegroom had solicited and obtained the honor of being allowed to adopt, instead of those of the Noailles; but no one chose to cut himself off from the future fêtes over which Princess Anna would preside, and, accordingly, the whole faubourg had made up its mind to give no pretext for the infliction of the threatened penalty. The duchess being one of the most charming and amiable women of the day, as well as one of the handsomest, appears to have made a most favorable impression on all these people, and to have really melted away a vast deal of social iciness by her genial smile and the bright glances of her beautiful, honest blue eyes. The round of visits, which had been so much dreaded on both sides, thus passed off with the utmost *éclat*, and the young duke has the satisfaction of seeing his wife adopted by the traditional friends and allies of his house.

The Hôtel de Mouchy, in the Rue d'Astorg, is one of the finest private residences of Paris; large, ample, full of historic paintings and sculpture, containing one of the richest private collections of art and *virtù* to be found in Europe, and with courts, stabling, and gardens on a scale scarcely rivalled by any other of the fine old residences of this city. It is now undergoing extensive repairs, and the Empress has lent to the new pair, meantime, the beautiful house she recently built for her mother, at the corner of the Rue de l'Elysée and the Avenue Gabriel. It was in this charming hotel that the duke and duchess gave their dinner.

Nothing in the lives of the very highest personages of the social world offers a more striking contrast to the habits of the "new rich" than the quietness of their luxurious splendor. Go into the dwellings of the nabobs of finance, of the various fields of lucky speculation, and your eyes are dazzled by the brand-new splendor of every thing they encounter. In the residences of those whose ancestors, like themselves, were born with "the golden spoon in their mouths," the luxury is solid, old-looking, quiet, with the well-worn look of an appendage in every-day use. Nothing is locked up for special occasions; nothing—unless the owners are away—is kept under cover. The beautiful house in which the duke and duchess have set up their temporary housekeeping, though so new, looks, inside, as though it had been inhabited for a hundred years.

On alighting, in the inner court, at the semi-circular vestibule, with windows all round, from which you pass to the staircase, you are received by tall footmen, in gorgeous livery and with a mass of powder in their hair, who pass you on to another functionary of that class, by whom you are motioned to ascend; a signal, sent by him through a silver tube, as you mount the stairs, bringing out another of the radiant tribe from an ante-room above. The broad staircase is so thickly carpeted that the heaviest foot would fall inaudibly; the balustrade is of old carved oak and bronze, the walls are painted in panels, and the ceiling is painted and richly gilded in sunk compartments. The effect of age has been skilfully imparted to these paintings by the dark colors employed, and probably some particular varnish. A superb chandelier hangs above the staircase.

The Mercury who emerges into view as you approach the ante-room deposits your card on a silver salver, and ushers you into the drawing-room. You observe, however, that the ante-room, which seems to be part of the landing-place, for it has no window, is hung with dark blue silk, surrounded by a sort of divan, covered with velvet of the same color, extending all round it, with a table in the centre, covered with the same material, and a thick Turkey carpet on the floor.

The double drawing-room, in which the young princess usually receives her visitors, is hung with satin (you never see wall papers in houses of this class), of a shade between chocolate and liver; rich and quiet, the play of light on the satin preventing the gloomy aspect that would be presented by paper, or even silk, of so dark a shade. There are no folding doors between the two rooms; their places being occupied by heavy curtains of the same satin, looped up with thick silk cords. The magnificent chimney-pieces—their mantel-shelves covered with embroidery—are laden with immense clocks, candelabra, vases, and small objects of art. Several richly ornamented pieces of furniture are placed against the walls, in buhl, carved ebony, and Japanese laque; and both rooms are literally filled with luxurious seats of all shapes, kinds, and sizes. Divans, like the hangings, are placed against the walls; little sofas, squabs, *tête-à-têtes*, ottomans, arm-chairs, lounging-chairs, and chairs of every possible style, are scattered all over the rooms, grouped about tables of various size, just ready for visitors to drop into, and so well-disposed that the guests would find themselves, by the mere fact of their cosy distribution, naturally disposed to go off into "chat." The more massive of these seats are covered with the same satin as the walls and curtains; the more fantastic are covered with oriental silks, the ground of which is of the same color, and the pattern in gold and bright colors; several have gilded frames, and a few of sky-blue contrast pleasantly with the sober tone of the rest. The centre-table of the larger room is covered with a superb India shawl, with a very rich, deep fringe, gathered into a sort of drapery below the top. An immense oblong table of dark rose-wood stands before the great bay-window, laden with newspapers, writing materials, books, etc., and with chairs conveniently placed round it. All the other tables are covered with objects of art, elegant baskets or pots of flowers, photographs, little busts, work-baskets, crochet-cases, books, smelling-bottles, and an infinity of small, elegant objects, most of them things of every-day use, but all works of art in their own line. The duchess's favorite seat—a great lounging-chair, with a book-stand attached, foot-rest, and other ingenious conveniences—stands beside the fireplace, with her own table to the left of her chair. This "table" is a *multum in parvo;* being a happy combination of drawers, writing-desk, etc., and is covered with little busts and photographs of the Emperor and Empress, her parents, relatives, and friends; dwarfed plants in tiny baskets, and all the materials of her usual occupations.

But the glory of this most charming drawing-room is its enormous windows, forming a deep bay, extending along nearly the entire front of the room, and looking out not only on the beautiful garden of the hotel, but into the vast grounds of the palace of the Elysée across the street, with its immense and magnificent trees, and on the innumerable trees of the Avenue Gabriel and the gardens of the adjacent hotels, all of them full of trees, the largest of the city, excepting a few of those in the gardens of the Tuileries and Luxembourg. In order to allow of the full enjoyment of what looks like some wonderful leafy fairyland or sylvan arcadia, these great windows are hung with dark blue gauze, which softens the light but allows of the scene outside being distinctly visible between the curtains of satin and embroidered lace, which make, as it were, a series of frames to the various pictures presented by the windows.

The piano (the duke is an accomplished musician) is placed cornerwise in one of the angles of the front room; hidden by a screen of trelliswork, over which living ivy is trained, the roots of the ivy being planted in a narrow box of zinc at the bottom of the screen. Add to the "items" already described the pictures on the walls, the rich, dark panelling of the doors, with their sober "bits" of gilding, statues, and vases in corners all about the rooms, superb chandeliers of rock crystal and gilt bronze, and the well-used appearance of all these comfortable and luxurious elements of home life, and you will have a pretty good idea of the cosy elegance of the most fortunate young couple of imperial France. Of course, when a fête is given, various other rooms are thrown open, all brilliantly lighted, and gay with magnificent flowers. But in every-day life the beautiful drawing-room, with all its costly and luxuriant appointments, is the most quiet-looking and cosy of apartments, one in which you could sit down comfortably to any task which you might happen to have in hand, without feeling in any way restrained by the touch-me-not newness and gala-day finery of drawing-rooms of a lower rank, reserved for visitors and show.

As for the fair princess who therein holds sway, she will receive you during the day-time in a toilette of the utmost simplicity, and with an entire absence of pretension. On such occasions she will probably wear a plain black silk morning-dress, white collar and sleeves, a tiny cravat, sand-colored gloves, and her beautiful hair artistically but simply put up in a net, with no jewelry or finery, and only the ornament of her bright eyes, pleasant smile, and graceful manner, offering a very marked contrast to the elaborate "getting up" of rich women of a lower rank whose morning toilettes are now-a-days almost as costly and overladen as their evening ones.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

THE RECONSTRUCTION DISCUSSION.

MR. ROBERT DALE OWEN has published a long letter in the *Evening Post* setting forth a plan of reconstruction, of which the leading features are the establishment of universal suffrage at a certain fixed date, say 1876; and the alteration of the basis of representation not in the way proposed by the Committee of Reconstruction, which inflicts a penalty on every State requiring an intelligence qualification or imposing a poll-tax, but by simply excluding from computation all persons disfranchised by the States on account of race or color. He also urges the necessity of taking precautions not only against the repudiation of our debt, or the addition to it of enormous sums for the payment of Southern claims for damages sustained by the war—both of these things he looks on as wildly improbable—but against the mere discussion of them in Congress. The mere agitation of these matters, even if it had not the smallest chance of success, would, he rightly considers, be very injurious to the public credit; he therefore proposes that the subject should be for ever excluded from the political arena by a constitutional amendment.

Mr. Owen adds, however, that a proposition even for the bestowal of prospective suffrage on the negro would, in the opinion of the majority of Congress, cause the rejection by the people of any constitutional amendment in which it was embodied. He, therefore, surrenders this part of his plan, and contents himself for the present with securing the colored population in the enjoyment of civil rights, but presses for a change in the basis of representation and the final and formal repudiation of the rebel debt and all rebel claims.

Now it may be that the majority are right as to the unwillingness of the country at present to force negro suffrage on the South. That they should think so, is comprehensible; but that gentlemen who have this strong impression of the conservative tone of the public mind should have so little hesitation as they have shown in asking that same public to pass an amendment excluding nine-tenths of the Southern people from all share in the government for the next ten years, is not comprehensible. Of all the wildly radical propositions for the settlement of the Southern difficulty that have been made this is unquestionably the wildest and most radical, and yet it has been coolly presented to the House by a committee which does not dare to speak of universal suffrage, and has been passed by the House, with what, in spite of all that has been said of Mr. Stevens's dexterous use of parliamentary tactics, may be fairly called alacrity.

The great difficulty with which Thaddeus Stevens and those who think with him have to contend in advocating their plans for the punishment and pacification of the South, is that these plans are opposed both to the genius of American institutions and to the temper of the times; and they are, therefore, sure not to be tried, or, if tried, are sure not to succeed. Confiscation, disfranchisement, retaliation, proscription of all kinds, as means either of reconciling large bodies of men to a new and distasteful order of things or of frightening them into obedience or acquiescence, are expedients borrowed from mediæval or pagan times—expedients that fifty generations of tyrants and conquerors have tried, and found worthless; expedients which no man who reverences human nature, and who desires its elevation, will ever desire to see succeed. That piece of fierce invective in which Mr. Stevens poured forth his latest views with regard to the treatment which we should deal out to the Southern States, was but the utterance in a deliberative assembly of the opinions on which for thousands of years the statecraft of the Old World has been based, and by which two-thirds of the atrocities of history were instigated. There was nothing startling or strange about them except their production at such a time and in such a place. And they are certain to fail here, because our polity, our religion, our manners, our theory of government, of morals, and of human nature are but a series of protests against them. We have repudiated them as solemnly as men can do. If there be any principle at the base of our Government and society, it is that the great remedy for disaffection is equality, protection, and freedom of speech, and that there is no worse way of making men orderly and submissive to law than putting them under a ban or disability. There is in our legislation no place either for hate or revenge, and anybody who seeks to embody either one or other in it is false to the very spirit of our institutions. We therefore have no hesitation in predicting that the disfranchisement section of the proposed amendment will neither be passed nor carried out, and in asserting that those who now attempt to lay it before the country either have very little knowledge of its temper or very little respect for its understanding.

But for reasons which, if not the same, are somewhat similar, we do not understand the hesitation which Congress shows in asking the country to agree to anything which looks towards securing the freedmen the means of protecting themselves which are offered in universal suffrage. Nobody who has watched the tendency of the times, and who is familiar with the processes by which our people reach their conclusions on the great problems of society and government, ought to feel that the exclusion of negroes from the franchise, either in Connecticut or in any other State, is of much value as an indication of what the popular response would be one, two, or three years hence to a demand from Congress that the Southern disease should be cured by the destruction of all the barriers which excluded the loyal portion of the Southern population from a share in the Government. The greatest glory of the country and its most marked peculiarity is that an appeal to principles is nowhere so effective, that principles have a charm and fascination for the public such as have never anywhere else been witnessed, and that their triumph, though slow, is certain; that no public man and no party which has ever yet taken his or its stand upon them has failed to succeed. We are not so readily captivated by them as the French. We never run mad after an epigram or a definition. We examine, discuss, and hesitate a good deal, but once we discover the article to be genuine, we fasten on it tenaciously.

The fact, then, that there is not a single argument against negro suffrage which is not based on prejudice, is one of the grandest import in our statesmanship. The ignorance of the negro is remediable, and the remedy may be controlled by Congress. The popular dislike to him will doubtless last long after he has wiped off from himself the last traces of the degradation wrought by slavery, and the dread of having the general Government unduly strengthened by its efforts to better his condition in reality generally comes from men who are never troubled by any assumption of authority if only the "nigger" is not the object of it. All these arguments against it are based on things temporary, fleeting, and evanescent. Some of them people are already ashamed to use.

On the other hand, our theory of government, the popular conception of the mission of the Republic—a refuge for men of all races and all creeds, in which artificial distinctions should count for nothing, and in which the poorest and meanest should enjoy the same legal rights as the richest and best-born—the popular love of principles, the popular love of fair play, the national pride in its republicanism, in its equality, are all fighting in favor of the very thing which Congressmen are so afraid to touch. Negro suffrage may be a bad thing, an inexpedient thing, a thing that, if established, will prove the ruin of the country. Many people have the same feeling about democracy itself; but nothing can be more certain than that we shall yet see every man in this country, black, white, yellow, red, and brown, voting, no matter what the consequence may be. Every influence by which society is affected is helping to bring this about. The whole current of progress, physical and mental and moral and religious, runs in this direction, and the shrewd politicians are those who count on it, look for it, and proclaim its coming, and not those who are afraid to mention it.

A BURIAL SERVICE.

To this burying
We come alone—you and I,—not with our dead,
But with our dearest living; oh, could mortal tread
Be unfaltering!

God knows how we love it,
This we have come to bury; the eyes smile; life's best wine
The hands hold out! Darling, shall it be yours or mine
To lay the first sod above it?

But no decaying
Can reach it, in this sepulchre whose stone
Our hearts must make! To an exceeding glory grown,
This grief outweighing,

Not even regretting,
It will await us! Thank God, not being sown
In any dishonor, it will await its own,
Never forgetting!

To Christ's protection,
Now let us leave it,—the tomb—and the key! He
Will remember us, if there may ever be
Resurrection!

H. H.

ELEGANT ORATORY.

THERE are certain contemptuous vulgarisms not honored by a place in any dictionary which are yet indispensable to people who habitually listen to the stump speeches of this and other countries. Highfalutin is a useful term of this sort; Blow is another; Blatherskite is another; and there are many more in many different tongues. A purist would probably deny them the name of language. They are all the fitter then, we may say, to designate a jargon which itself is neither an instrument of thought nor a means of communicating thought. They are just the criticism, quite respectful enough and quite discriminative enough, to pass upon the true stump eloquence.

It is not particularly pleasant to know that the critic of Congressional eloquence also does sometimes, however much against his will, find some use for these same terms; to find that the rhetorical standard of the cross-roads is sometimes the only standard applicable to the honorable orator who speaks for a great State in the national councils or tries to rise to the height of some great national occasion. The house of Pogram is as surely and as rapidly disappearing as the forests in which its founder was bred. Even the Southern branch of the family is in its decadence. Yet, as we read the morning papers, we can see that once in a while one legislator or another diminishes the respect which we like to entertain for him, by some amazing burst of spurious eloquence, which is not agreeable if we consider the speaker alone, and wholly disagreeable when we reflect that, by mistake, a well-meaning man has done something to bring the nation into contempt. Considered in itself the thing may be amusing. For example, there seems to be no good reason in the nature of things why we should not lump together the old, familiar, Fourth of July bird of freedom, at which all Congressmen probably smile superior, and that recent wonderful steam engine, and give the two the same uncomplimentary epithet. And if we ever laughed at our national emblem in his Glorious-Anniversary attitudes, one pinion flapping far above Upper Canada and the other overshadowing the trembling halls of the Montezumas, screaming the death-knell of European monarchies as he soars majestically to his Rocky Mountain eyry, why—unless because he appears in Congress—should we refrain from laughter at the Pacific Railroad locomotive of Mr. Banks's late peroration? That triumph of art is to wend its slow foot, we are told, up the precipitous slopes of the same Rocky Mountain chain, and, as its foot is slowly wended, is to scream out the last requiem of the solid men of Boston!

Eagle and engine are much alike. Some of the resemblances between them are not perfect, to be sure. For instance, though both are ill-tempered apparently, the scream of the eagle, it has been truly said, "discounts the universe," while in the scream of the engine we detect "the note of provinciality;" the eagle soars westward and the engine walks; one hates monarchs and the other aristocrats. But in this, at least, they are alike—both are truly screamers; and the one, we contend, is as fine a specimen of pure high-falutin as the other.

Nor is this merely the slip of a moment on the part of one man only. Such speaking is believed to be elegant and powerful oratory. There are gentlemen in Congress grieved at not being versed in it, and other gentlemen who are complete masters of it and constant practitioners, and others again who rise in their seats and say in praise of fustian very similar to this that it is "gifted words" and a "splendid tribute."

A few days since the House was considering whether the grade of general should be revived, and, of course, the chief theme of the speakers was the character and services of Lieutenant-General Grant. It was a theme which one might have thought adequate in itself, of a nature to demand and to be best adorned by an honest and dignified rhetoric, earnest, sincere, and without pretence. It is only a year since the whole North was in an uproar of joy because victory had come at last. The strain of four years of anxiety was at an end, the sacrifices of four years of suffering and labor were all rewarded, and the most tumultuous expression of gladness was nothing to the depths of heartfelt satisfaction beneath. The death of Abraham Lincoln came afterwards, or we might still point to that memorable time when the Confederacy fell as the time when the hearts and minds of loyal Americans were most at one and most deeply stirred. And in all our exultation and content, Grant was the man whom we most delighted to honor. We remembered then the February which had added the name of Donelson to a roll of battles that before had held no names but Bull Run and Bethel and Ball's Bluff, and how ever since then the conqueror of that army and fortress, fighting at Shiloh, at Vicksburg, at Chattanooga, in the Wilderness, had led our armies to the final success. Our pride in our victory was the measure of our pride in him and of our belief in his greatness. In Grant we recognized the impersonation of that tenacity which must conquer, and of that courage unconquerable which had obtained for the people so grand and so well deserved a success. Whatever may be the judgment of the critics upon his ability as a commander, his claims to admiration as a military genius, this solid glory must remain to him—that his country, after trying many men, and many good men, in him at last saw itself, and recognizing its own spirit, gave to him its undoubting confidence, and so accomplished its desires.

These recollections of what so short a time since was in the hearts of all must have been fresh in all minds. Yet, though Congress is mainly composed of men of sense and largely of men of ability and education, and contains several speakers quite equal to a worthy treatment of the subject, the selected orator of the occasion makes a pretentious speech which may be "gifted words" but is by no means the splendid rhetoric which he mistakes it for, nor at all what we had a right to expect. Silence or oratory we had a right to expect, and we get neither.

The rhetorician, the orator, for that matter, though it is well enough that he be born, may be made. To a certain extent, it is true that he must be made. And as there are plenty of text-books; as in almost no kind of literature are there so many models of excellence within reach as in the rhetorical kind, and in no field of intellectual labor is a failure apt to be more complete and ridiculous; and as, despite the newspapers, which usurp some of its functions, the art still offers to its masters great opportunities and great rewards, we recommend to Mr. Banks, Mr. Deming, and the other gentlemen of fluency that they proceed to the study of it. Cato, if they are fond of classical exemplars, began Greek long after he was fifty, and shunned no labor. Another person, an example equally classical and perhaps more to the purpose, used to lie on his back with lead weights on his breast in order to improve his chest tones. And, at any rate, till they have begun the study, we beg them to leave off the practice of the more difficult branches. Most men when they talk of business, when they really have something to say, talk well enough. It is when they begin to be fine, to display their ornaments, that these half-taught people expose themselves. And at the same time we see specimens of all that tawdry finery which a better taste discards. We have recently had a "splendid effort" wherein the seeker for the pinchbeck gewgaws of rhetoric may find a collection very good in respect of both quantity and variety. Of anti-climax, for instance, there is this pretty good sample: He, "when the rebellion struck the first tocsin, rushed to the defence of the flag under which he had been trained and nurtured—and offered his services to Governor Yates, of Illinois." This was the same man who previously had fought so well "on that memorable day when the steep and frowning heights of Chapultepec were carried, and the trembling city below implored the mercy of our artillery," and afterwards "wiped out Jeff. Thompson." It was he, too, who, being confronted with "the mightiest Paladin of treason," properly enough refused to believe that even a paladin "could suddenly throw a summersault over intervening forests and mountains into our lines." So, modern and unromantic tactics being applied to him, ever the mightiest Paladin found himself "outflanked and whipped." And if any one has a weakness for metaphor he can have his taste completely gratified, if indeed he be not completely cured of it. Here is one which has the stroke of a butcher's cleaver in it: "At Richmond, in April last, there was a blow struck which at the same time broke the head and paralyzed the extremities of the rebellion." And here are some which are remarkable both singly and in conjunction. The Capitol is described: "This massive structure, with its solid foundations, expanded wings, towering columns, and bubbling dome," which perhaps may all be

"engulfed in Lethe's dark waters," a fate which, somehow or other (perhaps the cadence is the reason of it), recalls the whelming of Araby's daughter. Whoever likes his metaphors mixed will do well to go to the historical sketch which opens the oration: "Far, far back at the very dawn of history, indeed upon the very first page of man's tempestuous annals, writ in faded hieroglyphs upon crumbling columns."

As to what may be read upon this singular tempestuous, dawning page, whose columns crumble and whose hieroglyphs fade, and upon other pages (very many other pages, indeed) which follow it, we learn that beyond a doubt Grant may properly be made a general, as can be proved by the history of Rameses, Sesostris, the Pharaohs, Achilles, Hector, King Agamemnon, commander-in-chief during "the war which for two lustrums raged round mighty Ilium," Themistocles, Miltiades, Aristides, Epaminondas, Cæsar, Hannibal, Charlemagne, Turenne, Condé, de Luxembourg, Marlborough, who having won the battle of Blenheim, "the extensive manor of Woodstock, once a royal palace—the scene of the loves of Henry II. and the fair Rosamond—was instantly conveyed to him in fee," Wellington, Jackson, Scott, Zachary Taylor, William Henry Harrison, and lastly Washington, against whose name "the mournful affix 'dead'" is written in the records of the War Department, a fact which "vividly suggests, in connection with a name so illustrious, that

"'The paths of glory lead but to the grave.'"

It is only too easy to laugh at the burning words of such oratory as this. But not a few of its characteristics—the style, with its mingled turgidity and meanness; the language, deformed by vulgarisms and without felicity of any kind; the clumsy ostentation of erudition, so cheap that its useless display is not even pedantry—these are shared with the bastard eloquence of the stump alone.

The best that can be said for such displays, and it is too disgraceful that this commendation should be possible, is that their faults are chargeable to defective taste and knowledge merely, and that when compared with some recent violations of Congressional decorum and outrages upon common decency they rise to respectability.

A HUMAN NUISANCE.

A MAN named Kranchie, or rather a man's mode of life, has been brought before the Board of Health in this city as a nuisance. He lives in a barrel on a vacant lot, and surrounds himself with offal, rags, and old bones, and lives on dogs and rats and other foul things, and the smell of his "appurtenances" poisons the air in his neighborhood. One of the inspectors has therefore reported him as a cholera-breeder, and proposes to have him abated.

This incident seems trifling, but it is in reality a most striking illustration of the enormous interval of feeling which separates us from an antiquity not very remote. Kranchie's habits are such as would two thousand years ago have entitled him to the rank and honors of a philosopher. The contempt which he displays for the comforts and even decencies of life would have been taken as the result of his meditation on the vanity of earthly things, and to his success in finding his happiness inside of himself. In the early ages of Christianity, or even in the Middle Ages, he might have passed his barrel and his rags and his old bones and dead dogs off as proofs of extraordinary sanctity, and thousands would have come long distances to get a whiff of his bad odors, and see him cast out devils and cure diseases, after having dined off the leg of a cat. Simon Stylites and many of the monks of the desert must have been twice as dirty and unsavory as he is. We do not know that Kranchie makes any pretensions to holiness—we hope not—but he undoubtedly would do so if the public gave him any encouragement in it, and that the public has not done so and does not do so is a proof of the distance to which we have wandered from the opinions and customs of our fathers. Had he lived in the ages of which we have spoken, we may be sure he would not have been dirty, and would not have lived in a tub very long, without finding out that he gained by it in popular estimation, and consequently without rising to an extravagant height in his own.

Closely allied to the ancient respect for philosophic or monkish indifference to dirt was the ancient horror of luxury, as a moral evil, and there is, perhaps, nothing which separates modern from ancient civilization more strikingly than the reconciliation which is in our day to be witnessed between good living and good morals. An ancient philosopher often surrounded himself with comforts, but he did so with strong misgivings as to their effect on his character. A modern philosopher secures all the good things he can afford not only without a qualm, but with perfect faith that they improve him, and that a man is likely to be all the better Christian and better citizen for being "well off." A proper sense of the vanity of this world is no longer held to be incompatible with a morning bath, a clean shirt, and the proprietorship of a pair of horses and a corner lot. Poverty and dirt have sunk gradually from the rank they once occupied as moral agents of the first order to that of almost unmitigated evils.

Just Published.

FAITH WHITE'S LETTER BOOK.

Pilgrim history will never tire nor grow old. Every fact relating to the eventful scenes through which our forefathers passed is a foundation-stone in our national edifice, and strikes a chord of tenderest interest in each American heart. The passage of years should only bind the nation, now almost in the noontide of its glory and strength, with stronger bands to the principles which led our ancestry to exchange homes of ease and refinement for the stern realities which awaited them on the shores of Plymouth.

The name of the work is significant of this central fact in our ancestral life. Faith White was the sister of Peregrine White, whose birth-place was the *Mayflower* in mid-ocean; and her "Letter Book" is a narrative of the trials preceding and subsequent to the "landing." Like a hive of sweets, it is filled with gems of rarest excellence, and seems almost embalmed in an atmosphere of pure and holy interest. Once begun the reader will hardly lay it aside till finished. It is a choice contribution to the Christian literature of the age, and will hold its place when more pretentious works have passed from sight and are forgotten.

Elegantly bound, gilt tops and illustrated, price $2.

Sent by mail, prepaid, on receipt of the price.

654 BROADWAY, between Bleecker and Bond Streets, New York.

LIFE OF BENJAMIN SILLIMAN, M.D., LL.D.,

Late Professor of Chemistry, Geology, and Mineralogy in Yale College, Founder and Editor of the "American Journal of Science and the Arts," etc., etc. By GEORGE P. FISHER, Professor in Yale College. 2 vols. crown 8vo, with fine portrait and other illustrations, cloth, $5.

THE NATION says: "His biography is modestly and judiciously edited—the story of his life being told in wise and skilfully adjusted selections from his own personal reminiscences, his copious journals, and his extended correspondence. It will excite very general interest and be esteemed of permanent value because, also, it presents a continuous picture of the general history and progress of the country from the beginning of the present century. Prof. Silliman represented in his own person some of the most important public interests. His acquaintance with distinguished men in every department of public and professional life, and holding every form of political and religious opinion, was very extensive. To read his life is to review the political and scientific, the religious and social history of the country for the last half century. It is not merely a picture of the times in which Prof. S. lived—it is also a portrait gallery of a great number of the men with whom he associated."

ALSO, JUST READY:

I.

TEMPERANCE:

RECOLLECTIONS, LABORS, DEFEATS, TRIUMPHS.

AN AUTOBIOGRAPHY. By Rev. JOHN MARSH, D.D., Secretary to the three first National Temperance Conventions, and thirty years Corresponding Secretary and Editor of the "American Temperance Union." 1 vol. 12mo, $2 25.

Copies sent by mail, post-paid, on receipt of price, by C. SCRIBNER & CO.

FINANCIAL REVIEW.

NATION OFFICE, Monday Evening,
May 21, 1866.

THE Government broker sold some nine millions of gold last week at 130 to 130⅛. Of this amount the bulk was taken by bankers for export, and two millions or so on speculation. Though the Sub-Treasury balance has not increased as much as might have been expected from such heavy sales, the movement of these large sums of currency has imparted more tone to the money market. Call loans have advanced 1 per cent., and should the Government continue to sell a further advance to 7 per cent. would seem inevitable. Money has now ranged at 4 to 5 per cent. for a much longer period than usual, and a change is but natural. No prolonged stringency can take place so long as the Secretary owes $125,000,000 on call at 4 to 5 per cent. But the banks will not resist an advance in the rate to 7, and would rather see money firm at that figure than otherwise. Of course, a 7 per cent. money market would for the time being put an end to the scheme for a 5 per cent. loan. Late advices from Washington increase the probability of strong opposition being made to Senator Sherman's bill. Senator Fessenden has already placed himself upon the record as one of its opponents, and he intimated that it did not even command the approval of a majority of the Finance Committee. The difficulty is that if the bill passed and it was found impossible to negotiate 5 per cent. bonds at par, the Secretary would be left without any means of funding his short-date obligations.

The stock market shows no new feature. Cliques continue to rule the day; where they are not moving stocks of all kinds are dull and neglected. The Prairie du Chien party, which bought large lots of Illinois Central ten days or a week since at 8 to 10 per cent. above the price in Europe, have since been bulling New York Central, the price of which they forced up at one time to 95. There is, of course, no justification for the movement in the earnings of the road, which are falling off. But the ease of money enables cliques to buy any quantity of a stock which they desire to put up, and, until they are forced by an advance in the rate of interest to disgorge their purchases, it is not certain that prices will decline. The quantity of New York Central on our market is unprecedentedly large. The Pittsburgh party continue to operate in a mysterious way. On Friday the price rose to 86¼, in the face of a decline of $23,000 in the April earnings. It has since been done at 84¾. Erie has fallen back again, and it is suspected that the bulls are tired of their game. The short interest in this and other active stocks is less than it was a few weeks ago. Fort Wayne is steady with a small business. Michigan Southern does not vary much; at or above 80 the clique appear to be willing to supply the stock. A new movement has been inaugurated in the stocks of the North-western road, and they are rather higher. Hudson has advanced 3 per cent. on a reported increase in the earnings. Toledo, likewise, is firm. The miscellaneous stocks have not varied materially since we last wrote. Governments are active, and the tendency would be downward but for the theory that the Secretary is sustaining 5-20s by purchases made with the money received for sales of gold.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	May 14.	May 17.	May 21.	Advance.	Decline.
United States Sixes of 1881	109	108¾	108⅞	⅛	....
5-20 Bonds, old	101⅞	101⅜	101⅝	¼	....
5-20 Bonds of 1865	102	101⅞	102	⅛	....
10-40 Bonds	96	96	96	...	⅛
7.30 Notes, second series	102⅛	102⅛	102⅜	....	⅛
New York Central	92¼	94⅛	93¾	....	⅜
Erie Railway	73⅝	73⅝	73¾	....	⅜
Hudson River	109⅛	109⅛	113	3⅛	....
Reading Railroad	107⅛	107⅛	107⅛	....	....
Michigan Southern	80	79⅝	79⅛	....	⅛
Cleveland and Pittsburgh	84¼	84⅛	85⅛	⅝	....
Chicago and North-western	28¼	28⅛	28⅝	⅜	....
" " " Preferred	59	58¼	58¼	....	....
Chicago and Rock Island	94¼	93⅝	93¾	....	⅜
P., Fort Wayne, and Chicago	99	98⅜	98⅛	....	⅜
Canton	61¼	60¾	60¾	....	1
Cumberland	45¼	47¼	46¾	....	1
Mariposa	12¾	12⅜	12⅜	....	....
American Gold	130⅛	130	130⅛	⅛	....
Bankers' Bills on London	109⅝	109⅝	109¾	⅛	....
Call Loans	5	5	6	1	....

The specie export for the week ending on Saturday last was $8,763,000, by far the largest export ever made from this port in a single week. Sterling exchange, which for many weeks had ruled at 106½ to 108¼, suddenly jumped to 109¾. Further specie shipments will be made this week, and the drain will continue until financial affairs resume their former smooth aspect in Europe, and prices are restored to a just equilibrium. The immediate causes of the sudden advance in exchange were the importation of American securities from Europe and the cessation of cotton shipments. But for some time a change has been inevitable. From various causes, prices of all kinds of merchandise and of all classes of securities have been higher here than in Europe. Not only articles of foreign growth, such as teas, coffees, hides spices, sugars, drugs, etc., have paid a profit on their importation from England, but American produce, cotton, breadstuffs, and provisions have ruled so much higher here than abroad that New York millers have sent to Liverpool to buy Chicago wheat, and New York bakers have sent to Paris to buy flour. A profit of from 2 to 5 per cent. has been realized on the importation of American stocks—5-20 bonds, Erie, and Illinois Central—for sale in this market. Cotton has not yet been re-imported, though at present prices a profit could be realized on the operation. So anomalous a state of things could not last long. The remedy has come in the shape of a sudden advance in exchange, and a resumption of specie shipments at a rate which promises soon to make up for their prolonged discontinuance. As it happens, the remedy—which will afford relief to the embarrassed banks of Europe—will involve no trouble here. Had we been trading on a specie basis, it would have gravely embarrassed us to lose nine millions of gold in a week. As it is, the Government supplies the bullion, and the transfer is not felt in commercial or financial circles. It is asked—how if the drain continues? The answer to this question depends on two things—first, the Southern cotton crop; and, secondly, the extent to which Northern importers are indebted to Europe. Government can afford to sell some forty millions of gold, which, if the coming cotton crop prove anything like an average, and if the importers have paid a fair proportion of their debts to Europe, will suffice to restore equilibrium, and will help foreign banks out of their troubles without embarrassing us. If, on the other hand, the coming cotton crop should fall considerably below an average, or if the importers, relying upon Mr. McCulloch's promises of contraction, have generally deferred their remittances, we shall inevitably ship all the gold the Treasury can spare, and when it is forced to stop selling the premium will rise, perhaps very high. It is no easy matter to form a reliable judgment with regard to either of these questions. A number of cotton circulars declare that the crop promises badly; that the seed proves bad, and that the plant is sickly. On the other hand, other authorities predict a crop of two million bales. As to the indebtedness of our merchants to Europe, individual enquiry would tend to prove that remittances have been general; every importer says that he and his friends have paid up promptly. On the other hand, it would seem but natural that many importers must have deferred remittances in the hope of a contraction of the currency, which was promised by Mr. McCulloch, especially as their spring business proved generally unremunerative.

It is clear that nothing but the policy of the Treasury Department now prevents an advance in gold and a decline in 5-20s. At 130½, all last week, the Treasury broker stood ready to supply bidders, and it is understood, though not officially avowed, that the bulk of the currency derived from the sales of gold was invested in 5-20 bonds. Thus the former stands no higher than it did when we were shipping cotton, wheat, corn, provisions, and bonds to Europe by every steamer, and the latter still command a premium, though they are coming from Europe at the rate of $2,000,000 to $3,000,000 a week. Should the cotton crop turn out well, this action of the department will figure in history as eminently sagacious. It will be said of Mr. McCulloch that, at a critical moment, by a judicious use of his resources, he checked the depreciation of the currency and maintained the market value of public securities. But if accident should reduce the cotton crop much below an average, the consequences of this interference with the natural course of prices will prove disastrous not only to the reputation of our finance minister, but to the best interests of the country. Mr. Chase tried to regulate prices from the blue room of the Sub-Treasury, and very nearly broke the nation in the attempt. Let us hope that Mr. McCulloch will be more fortunate.

THE NATION

Was, when started, essentially an experiment. Journals of a similar character had been tried and had succeeded in Europe, but the idea that there was enough interest felt here in literature or in art to support a paper mainly devoted to the discussion of literary and art topics, or that there existed what economists call an effective demand for any more careful or more general discussion of political news than writers of the daily press working between dusk and dawn were able to supply, was scouted by many. Our experience, so far as it has gone, satisfies us that it is this want of faith rather than want of appreciation which is the greatest difficulty which any such journal has to contend with here. Thousands enjoy it for the one who believes that his neighbors will enjoy it, and, of course, any very widespread doubt of its success increases the difficulty of succeeding.

TERMS—$5 per annum; 6 months, $3.

LIBRARY AND SCHOOL FURNITURE MADE TO ORDER.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

WEED SEWING-MACHINE CO.,
STORE, 506 BROADWAY, N. Y.

PARLOR AND CHURCH ORGANS AND MELODEONS.

MESSRS. CARHART & NEEDHAM, established in 1846, are the oldest manufacturers of the improved Reed instruments in the United States, Mr. Carhart being the inventor and patentee of all the essential improvements which have been made in these instruments up to the present date.

They have been established over twenty years, during which period they have manufactured a vast number of instruments of all classes; and wherever they have been exhibited in competition with the instruments of other makers, they have invariably taken the highest premium.

THE LAST TRIUMPH OF CARHART & NEEDHAM.

At the Fair of the American Institute held in New York in 1865 CARHART & NEEDHAM received the SPECIAL GOLD MEDAL over all the other instruments placed there in competition. The judges were Dr. Wm. Berge, C. B. Seymour (critic of the New York *Times*), Thomas Appleton, celebrated organ builder of Boston, George Jardine, also a well-known organ builder, and Dr. E. Ringer, an expert in the business.

EXTRACTS FROM THE SEVERAL REPORTS OF THE JUDGES.

From Report of Dr. Wm. Berge.

"The quality of the tone is the best I have ever heard, and the number of stops surpassed my expectations. The delicacy of *touch* and the quickness of *speech* are remarkable. In fine, I consider the Parlor Organ of Messrs. CARHART & NEEDHAM to be the best on exhibition, and therefore entitled to the highest award of the Institute."

From the Report of C. B. Seymour.

"The undersigned thinks it proper to suggest that CARHART & NEEDHAM should receive a Special First Premium for their large Parlor Organ."

From Report of Thomas Appleton.

"No. 526 is the best for the following reasons: 1st, It contains more reeds and of greater variety than any other. 2d, The reeds are placed above the key-board, thereby allowing a greater volume of sound to be heard. 3d, The successful application of the swell, which makes this instrument resemble the church organ more nearly than any previous arrangement. 4th, The voicing of the reeds is remarkable, and in the smoothness and quality of tone they resemble pipes more than reeds. The instrument is undoubtedly superior to any ever before constructed with reeds."

From Report of George Jardine.

"To the honor and credit of the United States of America a native American citizen is the first in the world who has discovered and demonstrated that not only can these vibrating tongues or reeds descend lower in the base, but of the very finest quality of tone, rich, round, and full, of quick articulation and free from *windiness*, right down to the 32 feet tone of C C C C. No doubt the fame of these gentlemen and their discovery will very soon and deservedly be circulated among the makers of Reed Organs in the world."

From Report of Dr. Ringer.

"No. 526 is the best for the following reasons: For its superior softness, evenness, and power of tone, being less reedy than in any instrument I have examined. 2d, For the great number of keys of different character of tone, which give the player an almost infinite variety of combinations."

THE GOLD MEDAL.

From Watson's Weekly *Art Journal.*

"AWARDS TO MUSICAL INSTRUMENTS.—A gold medal was awarded at the late Fair of the American Institute to CARHART & NEEDHAM for the best reed instrument on exhibition—a very just testimonial."

"They are an exceedingly good substitute for an organ, and I can speak of them in the highest terms."—GEO. W. MORGAN.

"I have found them to be the *finest instruments of the class I ever saw.*"—GEO. F. BRISTOW.

"They are entitled to be ranked as the *first* and *best* among instruments of their class."—WM. A. KING.

"*The tone is incomparable*, and they are *far in advance* of any other instrument of a similar kind."—CHARLES FRADEL.

Topics of the Day.

MR. STANTON on Wednesday read a long, written speech to a crowd which called on him by appointment. It was remarkably guarded in expression. The process of reconstruction, so far as it has gone, was detailed at length, and we learn that once Mr. Stanton thought the right of suffrage should be granted to some negroes at least, but on careful consideration of the practical difficulties in the way he gave up that opinion; the civil rights bill was passed, vetoed by the President, then passed by a two-thirds vote; the Freedmen's Bureau bill had his approval, but having been vetoed and not passed over the veto, it is not now a living question. The freedmen, the President has said, will find that their labor is, indeed, in the South, and that the fine climate and fertile soil of the Gulf States will attract immigration and make their labor still more necessary. It is a relief to find Mr. Stanton, at the end of the speech, speaking decidedly. The third section of the proposed constitutional amendment, which he quotes in full, he dislikes. He cannot see the wisdom, the justice, or the necessity of the measure; and one very strong objection to it, he thinks, is that it not only discourages the growth of Unionism in the South, but, by constitutional provision, it limits the power of Congress in that part of the country for the next four years—a limitation which may work deplorable results. This is an objection which we have not heard before, and it is not without force.

THE decennial farce of bringing in a bankrupt bill which nobody expects to see passed at the tail of the session, is once more acting at Washington. We shall not discuss the provisions of a measure which in three months will be forgotten. It is a national disgrace that, in a commercial country, men whom misfortune has overwhelmed should have no means of extricating themselves from their difficulties; but a striking illustration of the general prosperity is to be found in the fact that the debtors are such a small and insignificant body that even politicians do not think it worth while to attempt to relieve them.

MAJOR-GEN. BUTLER may still wear the title which he earned during the war, having been appointed to the same rank in the Massachusetts State militia, under its new organization. The field is one in which he figured before the rebellion, and in which, with his late experience, it cannot be doubted he will display the highest ability. Whatever be his fitness for a military command in active service—and about this many dispute who agree as to his great usefulness in suppressing the rebellion—it is, we believe, the testimony of distinguished officers who became his subordinates, that they could not have desired a better chief, at least in respect to the clearness of his purposes and his orders. This characteristic precision will be well employed in training the Massachusetts militia.

THE city of Memphis is indebted to the radical Legislature of Tennessee for the gift, a most unwelcome one, no doubt, of a new metropolitan police law. Governor Brownlow is to appoint three commissioners who are to appoint and manage the police force of Memphis while the city is to pay it, giving each patrolman, and there are a hundred altogether, $1,200 a year. Nashville and Chattanooga are put under the same system. No one will say that this interference with local independence was not called for, and we look to find it, expensive as it is, justified as effectually by the future quiet of Memphis as it has been by the past turbulence of that disorderly town. Prevention and cure are going on together. The Congressional investigating committee have reached the city and begun to examine witnesses.

A CORRESPONDENT who is a warm friend of the newly-established society for the prevention of cruelty to animals, and rejoices in the relief which that body has secured for calves in butchers' carts, writes to us making a strong appeal on behalf of green turtles and terrapins. He describes the sufferings of the turtles, when left exposed to the sun on the sidewalks, as very great; but the utilitarianism of the age is curiously illustrated by his urging, as the strongest argument against this treatment of turtles, the superiority of steaks cut from turtles fresh from the salt water over steaks cut from those which die by inches in the city. There was, when the Rinderpest was at its height in England, a similar odd mixture of pity for the beasts and sorrow for the loss of the meat visible in most of the lamentations over the plague.

NOTWITHSTANDING their seeming indisposition to concur with the House, the Connecticut Senate did, on Wednsday, elect Gen. Ferry to the U. S. Senate. The event must be regarded as another proof of the progress of the State away from its anti-negro-suffrage vote of last year, and confirms what we said in our last issue about the rapid gravitation of the people toward the point from which politicians shrink—that, namely, of applying our theory of government in its broadest equality to all classes throughout the land.

THE greatest fire of a season of great fires occurred on Monday night, completely destroying the Academy of Music and surrounding buildings. There are loud complaints of the new fire department, on the ground that it is managed by politicians, as if this was not also true of the old ones. The fire seems to have been the work of an incendiary, and some of the rumors as to the perpetrator of the crime are at least comical.

IN Texas and in Virginia, conventions have recently met and laid down the platform of a party which never before had an organized existence in the Southern States. The leaders and most of the members of these conventions have, however, from the period of the birth of the rebellion sustained an honorable notoriety under the title of Unconditional Unionists, a title which no men would have earned under the circumstances who were not more than politicians, more than states-

men, more than patriots; who were not men of singularly profound convictions, tenacity of faith, stern resolution, and heroic endurance.

In England the Continental troubles, combined with two or three years' indulgence, through the medium of joint-stock companies, in wild speculation, has brought on a financial panic of extraordinary violence, overwhelming most of the great banking houses and leading to a third suspension of the Bank Charter Act. Mr. Sampson, the city editor of the London *Times*, has now for five years been predicting "a grand crash," which during the years 1861–2–3–4 he always announced as likely to occur within the three months next ensuing, and the scene of which he laid in New York and the adjacent country. The occurrence of the long-expected catastrophe at his own door, in the presence of the extraordinary steadiness in the American markets, is one of the most striking illustrations we have yet had of the risks and vexations to which political and financial prophets, whose temper is not strictly controlled by their reason, are all the while exposed.

The latest developments make it clear that the whole of the European continent is now on the verge of a terrible war. Count Mensdorff declares, in a note, that Austria is determined to fulfil her duty to herself and to the Germanic Confederation "without being drawn into further discussions concerning the priority or extent of the respective military arrangements." Prussia, in the Diet, avows "that she will consider the requirements of her self-preservation as more important than her relations to the Confederation." Napoleon, at Auxerre, in oracular words addressed to the laboring population of his empire, in whom he finds "the true genius of France," but carefully prepared for the peace-loving and grumbling *bourgeoisie*, their spokesmen in the Corps Législatif, and Europe in general, openly expresses how much he "detests the treaties of 1815." The general belief is that France is in secret league with Prussia and Italy. Count Bismark, assailed by an assassin—a step-son of the revolutionist, Carl Blind—and thereupon serenaded by the people of Berlin, exclaims, in response: "We are all ready to die for our King and fatherland, be it on the street pavement or on the battle-field." Clarendon, in the House of Lords, laments that the British Government "stand alone, and . . . can do nothing," at the "melancholy sight" of "more than one million of men . . . in arms, and prepared for a conflict," "marching towards their respective frontiers." The financial world is shaken by a panic. An Austrian imperial decree announces the issue of Governmental legal-tender notes and releasing the National Bank from specie payments, and reports are current that the church property of the empire is to be made the basis of extensive war loans. In Italy communes and provinces vie with each other in offers of free contributions for the wants of the army. This is to be commanded by Lamarmora, with Generals Durando, Cucchiari, Rocca, and Cialdini as corps commanders, and Garibaldi as leader of volunteers; the Austrian army by Gen. Benedek; and the Prussian, by Prince Charles. The Italian Chamber of Deputies has passed a bill clothing the Government with extraordinary powers for the emergency; the Prussian Chamber has been dissolved. A secret conference of various minor German sovereigns has taken place in Würtemberg. The understanding between Austria and the States lately represented in the conference of Augsburg is said to be perfect, and Saxony, Bavaria, and Würtemberg are rapidly mobilizing their full contingents. Hanover, too, seems to arm against Prussia. Bohemia and Saxony, on the frontiers of which troops are being massed, are expected soon to become the scenes of great movements. Austria is also energetically arming on her southern borders, in Croatia, Talmatia, Istria, the Tyrol, and chiefly in Venetia; the country surrounding Mantua has been inundated for defence. Frightened by Napoleon's declaration of Auxerre, Belgium, too, is reported arming, and even Spain to fortify her strategic positions in the Balearic Isles. Switzerland is about to call out 15,000 men to cover her borders. In the east of Europe, too, things seem to approach a crisis, Russia and Turkey preparing for intervention in Moldo-Wallachia, whose new election of a hospodar has been rejected by the Paris conference, and the Slavic populations of Servia and Montenegro, it is said, for a new struggle against the Porte.

CONGRESS.

WASHINGTON, May 23, 1866.

The passage of the bankrupt bill on Tuesday was a surprise to many members not only because of the previous repeated defeats of the measure, but because of its supposed bearing upon the coming fall elections. Mr. Thaddeus Stevens had been good enough to warn the House long since that such a law might prove a political death-warrant to the party which should pass it, besides that it would discharge all rebeldom from its commercial obligations to the North, and he yesterday tried to get in a motion "to postpone this hari-kari until December." But the House—though by the narrow majority of nine—determined otherwise.

A most beneficent measure for the freedmen has now passed both Houses, and awaits the President's signature. It extends the provisions of the homestead law over the public lands in States late in rebellion, reducing to $5 the price to be paid for each patent, and giving eighty acres to each actual settler, without distinction of color. It is also provided that these lands shall be disposed of in no other way.

DIARY.

Monday, May 21.—In the Senate, the Colorado veto message was made a special order for May 29. The fortification appropriation bill was passed. District of Columbia business occupied the rest of the day.

In the House, Mr. McClurg, of Missouri, offered a resolution instructing the Joint Committee of Fifteen to enquire into the expediency of levying contributions upon the States lately in rebellion to defray the expenses of a standing army to keep the peace in those States. Adopted—yeas, 73; nays, 25. Mr. Henderson, of Oregon, offered a resolution in favor of executing the laws upon a sufficient number of leading rebels to vindicate the law and warn the refractory for all time to come. Adopted. Mr. Defrees offered a resolution declaring that Congress has no constitutional right to fix the qualifications of voters in the States. Referred to the Judiciary Committee, the House first refusing to lay it on the table by yeas, 12; nays, 97. The tax bill was debated and amended.

May 22.—In the Senate, House bill to sell the public lands in the late rebel States to actual settlers, without respect to color, in homesteads of eighty acres, was passed. A bill to amend the postal laws in sundry details was passed.

In the House, the bill to establish a uniform system of bankruptcy was passed—yeas, 68; nays, 59. A bill providing for an additional Assistant Secretary of the Navy was passed. The rest of the day was spent in debating and amending the tax bill.

THE FREEDMEN.

It is reported that the crops in South Carolina will disappoint the expectations of some months back. The chief cause is the general failure to raise provisions to feed the laborers engaged in cotton-raising. If all that has been planted and prospered could be harvested, there would be little or no deficiency, and, of course, no waste, as there must now be. We have, besides, accounts of two destructive tornadoes—one, on the 4th, demolishing the freedmen's village on Port Royal Island and nearly all St. Helenaville; another, on the 17th, which swept over Charleston and the adjoining counties. Not only the fields suffered, but several lives were lost.

—Brigadier-General Gregory has just returned from an extended tour of inspection in Western Texas. The industrial condition of the country is good and improving; but with the reduction of the military force there has been a perceptible increase of violence and abuse of the colored people. With a favorable season the cotton crop, it is re-asserted, will be larger than ever before. The health of the State is good. There are 42 day schools for the freedmen, 29 night schools, and 19 Sunday schools, counting 2,830 children and 1,860 adults as pupils. There are also several private schools. All are wholly self-sustaining.

—Gen. Howard, in a circular admonishing the agents of the Bureau of their duties, assures them that such as may be accused of malfeasance shall have the opportunity of a thorough vindication before a court-martial.

—Gens. Steedman and Fullerton had an interview at Savannah on the 19th with the General Conference of the African Methodist Church, composed of colored clergymen from Georgia, Florida, and South Carolina. The commissioners departed next day for Florida.

—A brisk religious revival is going on among the freedmen's villages on the Peninsula, says a telegram from Fortress Monroe.

—The North Carolina *Progress* has heard "good tidings from the crops in Granville, and also as to the industry of the freedmen. The yield from the former will perhaps be larger than for some years, and he freedmen are working better and harder than previous to the war."

Notes.

LITERARY.

THE edition of the Bible in Arabic, which is in process of preparation by the American Bible Society, is one of the most interesting literary undertakings of the present time. Three separate editions are to be issued—one in octavo, a second in duodecimo with references, and a third still smaller in size. The translation used is the one which was begun by the late Dr. Eli Smith in 1847, and finished by Dr. Van Dyck in August, 1864. The punches, matrices, types, and electrotype plates are all made at the Bible House, under the supervision of Dr. Van Dyck. The work was begun in August, 1865; the first page was electrotyped March 15, 1866, since when thirty more pages have been finished. It is expected to issue the large Bible in about three years. Full eight years must elapse before the other two are ready. Some idea of the difficulty of the work of composition can be had from the fact that sixteen hundred different characters are necessary. The text being printed to imitate script, many varieties of each letter are requisite in order to secure accuracy of joining and an even appearance in the words. Considerable trouble was also experienced from the necessity of learning, by trial, how many type of each character must be cast. One important result of the distribution and cheap sale of this Bible in the East will be the gradual familiarization of the natives with printed books. Printing is there considered a work of the devil, and the Koran and other books are all published in manuscript. Written copies of the whole Bible, and especially of the Gospels, in Arabic are quite common among the educated Turks. Nearly all persons who pretend to culture have them in their libraries. The American Bible Society also contemplate printing an edition of the Bible in the ecclesiastical Slavonic and Bulgarian in parallel columns. The work will be commenced under the superintendence of Dr. Long, of Constantinople, as soon as that gentleman arrives.

—The literature of the rebellion is about to be made the subject of a bibliographical treatise. Mr. John Russell Bartlett, author of the "Dictionary of Americanisms," is compiling a catalogue of all the books and pamphlets that relate to the civil war, and to subjects growing out of it, together with works on American slavery, as well as the essays in reviews and magazines on the same subjects. Nearly 6,000 titles will be included in the book, which will be an octavo volume of 500 pages. But a small edition will be published—250 copies in royal 8vo, at $6, and 60 copies on large paper at $12. The publishers are S. S. Rider & Bro., of Providence, R. I.

—The practice of importing English books in sheets, and then selling them at a reduced price to suit the American market, with the imprint of the American publisher, has greatly increased of late, owing to the high ruling prices. Indeed, it is very foolish and uneconomical to waste labor in reproducing a book which must be sold at a higher price than the imported copies. One other advantage is that part of the profit goes to the author. Lippincott & Co., of Philadelphia, Roberts Bros., and Little, Brown & Co., of Boston, have recently published many books in this way. D. Appleton & Co. have issued three valuable books which could never have been reproduced here on account of the number of wood-cuts; we mean "The World before the Deluge," "The Harvest of the Sea," and "Homes without Hands." They have also imported five hundred copies of the new eight-volume edition of Lord Macaulay's works edited by Lady Trevelyan, which are sold at forty dollars, a considerable reduction from the original English edition. This edition of Macaulay is very complete, containing everything of which Macaulay acknowledged the authorship, even the essays on Mill which he refused to print in the edition prepared by himself. Besides the history and the essays, we have his speeches, the introductory report and notes on the Indian Penal Code, the papers which he wrote for "Knight's Quarterly" in 1823 and 1824, and all his poems. Among the latter are several translations, one of "Dies Iræ," and some humorous poems, such as "A Radical War Song," and other election ballads. There are many passages in the essays and the history that show a fine sense of humor, and it is not surprising to find two very amusing papers here, "Some account of the great Lawsuit between the Parishes of St. Dennis and St. George in the Water," and "A prophetic account of a great National Epic Poem, 'The Wellingtoniad,' A.D. 2824." In the preface which Macaulay wrote for his essays, and which is reproduced here, is a criticism which will startle many of those young writers who are in the habit of taking the essay on Milton as a model of style. Speaking of the exact republication of these essays in the form in which they were written, he says: "Even the criticism on Milton, which was written when the author was fresh from college, and which contains scarcely a paragraph such as his matured judgment approves, still remains overloaded with gaudy and ungraceful ornament." Few writers have ever criticised themselves so severely in print.

—A singular case relating to literary property has just been decided in the French law courts. In 1814 an eminent French surgeon, Nysten, published a "Dictionary of Medicine and Surgery," which became a standard work. Nysten disposed of the copyright to the work, and it has frequently been republished since his death. Various modifications and alterations have been made by successive editors, until the original text, as is alleged, has entirely disappeared, though the work still bore the name of Nysten, by which it was known to the medical public. The last changes seem to have been very radical, and excited the displeasure of the Nysten family. Madame Nysten accordingly sent a note to the publisher, stating that, as the moral and philosophical spirit of the original plan of the work had entirely disappeared, there was no reason for using her husband's name, and requesting it to be taken off the title-page. Messrs. Baillière, the publishers, so far complied with her wishes as to issue the new edition with the title of "Dictionary of Medicine, etc., based on the plan of Nysten, and entirely remodelled by Messrs Littré and Robin." As the name of Nysten was printed in large characters, and those of the editors were less conspicuous, Madame Nysten was still dissatisfied. Feeling that a wrong was done to the memory of her husband, she brought a suit for damages against the publishers. The court gave judgment in her favor for 2,000 francs damages, besides costs and expenses, on the ground: "That the rights and duties which arise from marriage, both as regards husband and wife, do not end with the marriage itself; that the wife shares with her children in the honor and consideration which attach to the memory of her husband, and that she has, like them, personally, if these are attacked, the right to demand reparation."

—The theatres of Paris have had some brilliant successes during the last year, although so lowered has become the character of that stage that few of the comedies would bear translation and reproduction here. Three comedies especially, all intended to be pictures of the manners of the day, have had, and are still having, great runs—"Le Supplice d'une Femme," for whose authorship Dumas and Girardin contended; "La Famille Benoiton," by Sardon; and "Héloïse Paranquet," which was given anonymously. "Le Lion Amoureux," by Ponsard, was more elevated in character; but the last new piece, "La Contagion," by Emile Augier, of the Academy, surpasses the rest in impropriety, as it does in merit. The receipts of some of these pieces for the year 1865 were very large. At the Opera there was taken for "L'Africaine" 1,545,000 francs; at the Théâtre Français, with "Le Supplice d'une Femme," 942,923 francs; at Le Gymnase, with "Les Vieux Garçons" of Sardon, 714,397 francs; at Le Vaudeville, with "La Famille Benoiton," 536,462 francs; at Les Variétés, with the operetta of "La Belle Hélène," 822,212 francs; and at the Porte St. Martin, with the spectacle of "La Biche en Bois," 1,427,228 francs. Some of these pieces were played for the whole year, and continued on the stage long into 1866. Besides these, Bazin's "Le Voyage en Chine" and Offenbach's "Orphée aux Enfers" brought in immense sums to the Opéra-Comique.

SCIENTIFIC.

THE POTASH MINE AT STASSFURT.—In view of the close analogies which subsist between the two compounds, chloride of potassium and chloride of sodium, their nearly equal solubility in water, and the wide dissemination of potash as well as of soda in nature, it is not a little remarkable that while chloride of sodium (common salt) is found in abundance in sea-water, and in many special deposits in the bowels of the earth, its congener, chloride of potassium, occurs only in small quantities in the water of the ocean and has hardly ever been found in abundance anywhere. Any exception to a rule so general is, of course, worthy of careful attention. Hence much interest was excited, a few years since, among geologists and chemists by the discovery of an enormous deposit of a mineral containing chloride of potassium in a bed of rock-salt at Stassfurt, near Magdeburg, in Germany. How this potash-mineral came to be deposited in its present position is not apparent to the uninitiated. The question seems even to puzzle the adepts, judging by the number of memoirs and opinions concerning the geological relations of the deposit which have appeared since its discovery. Latterly, thanks to the introduction of improved processes of purifying the mineral, the subject has become prominent in another connection, and is now exciting a good deal of comment in chemical and technological literature. The deposit has in fact now come to be recognized as one of the principal sources from which the potash-salts of commerce are to be henceforth drawn; and as the supply appears to be well-nigh inexhaustible, it can hardly fail to exert a very considerable influence upon the progress, or rather upon the direction, of the chemical arts.

The bed of rock-salt in which the new mineral occurs was examined, by boring, as long ago as 1839–43, but the brine obtained in this way was found to be so largely contaminated with magnesia that there was no encouragement to work it. In 1848, Prof. Marchand expressed the opinion that the magnesia of the brine was not derived from the bed of rock-salt, but must have come from some other source. This opinion was corroborated by matter brought to the surface in subsequent borings, and the conviction was finally arrived at that the magnesia-salt in the brine was derived from a bed lying above the true rock-salt. In 1851 mining operations were commenced by the Prussian Government for the purpose of reaching the rock-salt. Between that time and 1856 a couple of shafts were sunk to the depth of some 1,100 feet, at which depth a bed of impure rock-salt was struck—some distance below the potash-mineral—the value of which was at that time unsuspected. In 1857 pure rock-salt was reached, as had been anticipated, and its extraction commenced; but it was not until 1859 that the true value of the layer of the potash-mineral was recognized. The dip and general character of the deposit having by this time been well made out, a new pit was sunk in the Duchy of Anhalt, at a distance of about four-fifths of a mile from the old mine. By means of this new shaft both the potash-mineral and the rock-salt are reached at a less depth and can be worked to better advantage than before. The new shaft was completed towards the close of 1862, and since that time the mining of the potash-mineral has been very largely developed, both in the old and the new workings, while the extraction of the rock-salt has become a matter of secondary importance, especially at the new pit.

That portion of the deposit which has thus far been explored has a thickness of about six hundred feet. It consists of a bed of rock-salt, of enormous extent, upon which, and capping it as it were, repose layers of several saline minerals. The entire deposit may be divided into four principal layers or beds, each of which is well characterized at its centre by the predominance of minerals peculiar to it, though at the points where the layer comes in contact with the underlying and superimposed beds its character is by no means so well defined. The rock-salt at the bottom has been entered to a depth of some three hundred and fifty feet, though as yet it has never been pierced; it consists of pure chloride of sodium interspersed with veins of sulphate of lime (anhydrite). Next above is a bed one hundred feet thick of the same character as the preceding, only that the veins of anhydrite are here replaced by a complex sulphate of potash, soda, and magnesia (polyhalite). Above this is a bed of ninety feet composed of sulphate of magnesia (kieserite), mixed with a double chloride of potassium and magnesium. And, finally, at the top there is a layer some sixty-seven feet thick of the potash-mineral proper (carnallite); this is a hydrated double chloride of potassium and magnesium containing, when pure, about twenty-seven per cent. of dry chloride of potassium.

The mineral is detached in large masses from the bed by means of gunpowder; these masses are then broken up into small fragments by means of pick-axes, and sent up to the surface. The cost of extraction appears to be exceedingly low, and the amount produced is limited only by the demand. At the time when it first became apparent that the potash-mineral was of value, it was sent into commerce in the crude condition, to be sold as a manure, and for this purpose it is still largely employed; but it was not long before a complete system of purification was organized, and at the present time enormous quantities of pure chloride of potassium are prepared from the crude mineral. There are now a dozen or twenty factories at Stassfurt devoted to the treatment of the mineral. In July, 1864, when the demand for chloride of potassium was active, the most important of these factories turned out some 12,000 to 16,000 pounds of chloride of potassium daily, while in each of the smaller works the yield ranged from 2,000 to 4,000 pounds. The crude mineral rapidly absorbs water, and deliquesces on being exposed to the air, so that it must be purified as soon as possible after it has been brought to the surface. Moreover, it has not been found advantageous to transport the mineral to any great distance from the mine, since, on the average, no greater yield than 16 per cent. of chloride of potassium can be obtained from it. Hence all of the mineral, excepting those portions which are employed in agriculture and for the preparation of freezing mixtures, is subjected to treatment near the mouth of the mine. This treatment is in the main founded upon the fact that on soaking the mineral in a quantity of warm water, insufficient to dissolve the whole of it, the chloride of magnesium will dissolve first, and may be poured off in solution, while the chloride of potassium is left in the solid state. This residuum is now treated with a fresh portion of water, which dissolves the chloride of potassium, but not the earthy impurities. The chloride is finally recovered by crystallization. Besides the chloride of potassium, considerable quantities of sulphate and of carbonate of potash are manufactured by appropriate chemical treatment, the production of these salts being fostered by a government bounty Saltpetre also is made by decomposing Peruvian nitrate of soda with chloride of potassium. There is some question, however, whether, with the exception of the saltpetre, the manufacture of these salts is likely to rise to any considerable importance, for there is neither pyrites nor any other source of sulphur in the vicinity, nor has there been discovered, as yet, any way of procuring in Stassfurt, at a low cost, the sulphuric acid which is so essential to the success of this, as of almost every other, chemical manufacture. In other respects, Stassfurt is favorably situated for the prosecution of chemical operations, since an abundance of water and of lignite is to be had close at hand.

Just at present this new branch of industry is suffering from a reaction which has succeeded to the undue activity and expansion of 1864. At the moment when the potash mine at Stassfurt first began to make itself felt as a new element in commerce, in 1863 or thereabouts, the relations which obtained between the producers and consumers of potash compounds reposed upon a tolerably firm basis. The sources of potash were in a measure limited, the tendency was ever towards a more restricted supply, and, as a consequence, the price of potash salts was not liable to very sudden fluctuations, and was relatively high as contrasted with the price of the salts of the other alkalies, soda and ammonia. So long as the Stassfurt manufacturers could obtain the prices then ruling, or an approximation to these, they, as a matter of course, pushed off as much of their product as could be made, the business being highly remunerative. It was easy to do this so long as consumers of potash salts failed to perceive the significance of the new condition of things. In 1864 there was thrown into commerce from Stassfurt some 30,000,000 pounds of chloride of potassium, this being just so many pounds more of this substance than the world had been accustomed to use. The market was glutted, of course. No immediate, instantaneous, and adequate demand is ever likely to greet a new-comer thus suddenly thrust in upon the market-place. On the contrary, all repelling influences awaken from their quiescence, and conspire to force back the invader. As the price of chloride of potassium began to fall, that of the ammoniacal salts of the English gas-works was reduced still more rapidly in the attempt, probably futile, to prevent the potash salt from regaining its old importance in the manufacture of alum, a position from which it has long been well-nigh excluded—so far as Europe is concerned—by the cheaper ammonia. In the same way the lixiviators of "kelp," the ashes of sea-weeds, whose profits depend upon the sale of chloride of potassium as well as of iodine, increased the price of the latter and lowered the price of the former, as a welcome to the uninvited guest. That the East Indian producers of saltpetre lent another cold shoulder need not be said, though the full significance of their action is obscured by the influence of the wars which were then prevailing. For the present purpose it will be sufficient only to mention the fact that the export duty upon saltpetre was first diminished and subsequently altogether withdrawn.

In consequence of all these opposing influences the production of chloride of potassium at Stassfurt fell off largely. In a comparatively short time the price of this salt fell from $3 to $1 50 the hundred weight, although the production was at the same time reduced something like 25 per cent. The amount of mineral treated at the Prussian mine in 1865 was only ninety millions of pounds against one hundred and fifteen millions of pounds in 1864. It is very possible that the present depression may last for some time, or become even deeper, in spite of the recent assertions in German journals that the worst is passed, and that symptoms of the revival of business are abundant; but there can be no question as to the prominent position which the working of this mineral-potash is destined to assume among the chemical arts. Of course most of the secondary sources of potash, which have been nursed by European governments, must now be abandoned. For example, the elaborate method of obtaining potash-salts from sea-water, which had risen to some importance in the south of France, has already been given up. The amount of influence which the opening of this German mine will ultimately exert upon the production of American potashes, is a point worthy of being watched with attention.

THE LOST MANUSCRIPT.*

The influence of the literature of one country upon that of another is generally so subtle that it is equally difficult to fix its limit or to ascertain its character. Leaving out of consideration the effect of the Greek mind upon the Roman, the most obvious instance of the direct action of the

* "The Lost Manuscript. A Novel. By Gustav Freitag. Three Volumes." London: Chapman & Hall. 1865.

thought of one age upon the intellectual development of another is, of course, in what is known as the *Renaissance* in Italy, which was nothing more than the Neo-Platonism of Alexandria, with its aspiration for a purer life reflecting itself under similar conditions of corruption in Florence. Yet that very reproduction of ancient thought illustrates in itself, also, in many ways, the final divergence of the modern from the ancient civilization; for the life it awakened took a different direction and entered upon a much higher plane. But in most instances, like that which has recently been brought to light by Le Clerc of the diffusion of the French romance of the Middle Ages not merely through Western Europe, but even in the Greek empire of the East, so much abused for its stolid perseverance in decay, though it is easy to detect the prevalence of a certain taste, as for chivalrous adventure, common to the age, it is impossible to discover a pervading inspiration caught by one people from another.

In the multiform development of modern times it becomes still more difficult to trace this process of mutual education; for as the leading nations, the French, German, and English, stand upon pretty nearly the same intellectual level, though they have certain specialties in literature as in manufactures, no one of them gives the tone to the others. Our fashions, indeed, come from the Tuileries; but we have not as yet borrowed the pattern of our poetry from the Palais Royal, nor that of our histories from Unter den Linden. On the contrary, in one respect at least, we have rather set the fashion for the rest of the world. Rich as the English literature has been in the past, it is richer to-day, we venture to affirm, in the novel properly so called, than that either of Germany or France.

In Germany, indeed, it was not till the recent appearance of Freitag, to whom we desire now to call attention, that the novel proper seems to us to have come in. There has been plenty of romance, but no representation of real life, which is what we understand by the novel proper, with its follies and vices as well as its nobility and truth; the life of the world as it goes on about us, refined and brutal, intellectual and sensual, the sport as it were of many capricious forces, which, nevertheless, are found, when carefully analyzed, to be tending, though from opposite quarters, to the production of one general result of enlightenment and reform.

We do not mean, of course, that Freitag is the first or only writer of German fiction. The Leipsic press probably pours upon the world as great a quantity of fiction as that of Paris or London, perhaps greater; but to the English reader, with his taste formed by the great writers in his own literature, it is for the most part a dreary waste of dulness, drearier if possible than the ponderous criticisms which strive to explain its tendencies. But we mean that leaving out of view the romance, of which there is so much, and often of so exquisite kind, in Tieck and Novalis and Stifter and Storm, and many others living or dead, Freitag is the first really great realist in modern German fiction; while in dramatic power and felicity of style, though not beyond all others, he is certainly equal to any among contemporary writers.

It is quite unnecessary to go out of the way to show that he does not stand, as the German critics in their admiration affirm, upon the same footing with Thackeray and Dickens. They are men of genius, and Freitag is not. They are great masters, Freitag is only a cultivated artist. The creations of Dickens, like those of Shakespeare, have an existence of their own; Freitag's are the reflections of other people's lives—not the spontaneous growth of his fancy, but the results in artistic form of his observation.

Yet the English reader, though he may not gain in quality in the German novelist, will gain a great deal in variety. The gasping poor of London, and the sharpers, male or female, of the Boulevards, do not make up the whole of life; they do not even typify it. There are many poor persons, indeed, in the world; but, though few are rich, a great many more are neither rich nor poor; and that is especially the case in Germany, where, owing to the equal distribution of property among all the children of a family, the number of persons who stand upon the same general level in respect to property is quite as great in proportion as in this country. It is in the representation of this class that Freitag is not only most successful, but of greatest use to us. For the middle class in Germany is the class of its thinkers and artists and writers; the class with which we are most in sympathy, because we have most in common. The aristocracy of England, if not directly the subject, forms at least the background of most English novels; but that aristocracy is as much a tradition in this country as the Roman. So far from being in any way related to us, it stands in ever increasing contrast with all our sentiments and habits of life; while on the other hand the intellectual freedom of Germany among the middle class comes home to us, spiritualizes our character, and deepens our thought. We are drawn to it as to fellow-toilers in the same field—fellow-sufferers in the same cause.

In depth of thought, in poetic insight, Freitag may be inferior to some of the writers with whom one familiar with German literature would compare him, but in his artistic grasp of this life of the middle class about him, of which he himself is one of the best instances, he seems to us really to have made a revolution in German literature; and, as the representative of its present tendency to realism, will attract to himself, we are sure, more and more the English reader in search of pictures of foreign life and of the beauty that lies under all life. That he will be popular with the many who feed on the inferior English novels we do not expect. His first work which, under the title of "Debit and Credit," was so well received in this country several years ago, found its readers chiefly, we suspect, among more thoughtful persons. Those in pursuit of a sensation must have found it tedious.

His last work, however, "The Lost Manuscript," of which a translation has recently been published in London, seems to us more likely to obtain a large circle of readers. There is more dramatic power in it, greater concentration of interest, and greater insight into character, as well as on the whole what one may call, perhaps, superior finish. The fascination of the style, however, is almost wholly lost in the translation; and the loss must necessarily injure him in the estimation of the English reader, for his style is one of his best charms. In order not to be misunderstood, however, we ought to add that we have read only the German original. Our remark applies to translations in general. The style evaporates in the process. It is only when a man of great power applies himself to the work, as Carlyle did to "Wilhelm Meister," that one finds the original reproduced in the beauty of its form as well as in its substance. "The Lost Manuscript" is a picture of life in a German university town, not, however, of the student, but of the professors, with sketches of life in the country and at one of the minor courts. The foibles of the professors are hit off with the most delicate satire, while the undertone of self-sacrificing devotion to the truth shows how near the reality of things we should come if the writer, beside being a scholar himself, were also a poet.

We do not mean, however, to state the plot; that has always seemed to us unfair to the reader if his attention can be drawn to a novel in any other way. A word about the writer himself will be more useful, for nothing helps us better in getting at a knowledge of a work than some acquaintance with its author. Born in Silesia in 1816, Freitag was carefully educated in the universities of Breslau and Berlin, and took his doctor's degree in the latter city in 1838. He was then occupied at the University of Breslau as a private teacher of the German language and literature; but the poetic faculty steadily gained upon the scientific, and he published poems and dramas. "Die Valentine" is one of the most popular plays and "Die Journalisten" is one of the most amusing comedies on the German stage. In 1847 he went to Dresden, and then to Leipzic as one of the editors of the *Grenzboten*, a popular journal, from which he withdrew, however, several years ago, and now divides his time between Leipzic in the winter and his country-place, near Gotha, in the summer. His "Pictures of German Life," in two series, each of two volumes, have been translated into English, and will be found one of the most careful as well as most interesting delineations which exist anywhere of German society in the last three or four centuries.

In 1855 appeared his "Debit and Credit," which was afterwards translated into the English and other languages, and was so popular in Germany that hundreds of manufacturers presented it to their sons as a testimony to the dignity of their own social position. In the course of a couple of years it went through six or more editions, which, as Bunsen philosophically remarks, may certainly be taken as the best proof of its excellence, when it is considered that the price of it was nearly four dollars (gold.)

But as we began by saying that it is difficult to detect the influence of one literature upon another, we end by saying that it is often most difficult to determine the course of that influence when its presence is most apparent. The realism of the English novel and of English life has found in Freitag its best representative in Germany; but it is because the basis of the German character is, after all, realistic. The romanticism which came in with the overthrow of Bonaparte was a perversion of the German mind. Industrious by nature, the German cannot be a dilettante. So forced a thing, indeed, was this romanticism that, as Julian Schmidt says, they all breathed freer when Auerbach showed them in his peasant tales that there were beings in the world who had a distinct conceivable occupation. The poetry of despair does not flourish well on German soil. Victor Hugo and Balzac have left few traces upon the German mind. English literature, from the day when Lessing first discovered Shakespeare, has left many. Yet it will be observed, as in the case of Freitag, that, though the English influence is obvious, the native strength of the German mind gives it a new direction, while it aims at finer results.

For the reasons we have indicated, therefore, we cannot but commend

"The Lost Manuscript" as not merely one of the best German novels that have thus far been rendered into English, but as one of the best in German, and a very good one at that.

DABNEY'S LIFE OF STONEWALL JACKSON.*

Dr. Dabney has several important qualifications for writing this biography. He served on Jackson's staff in two important campaigns, he was a personal friend of his hero's, and he had access to the archives of the Confederate War Department and to Jackson's correspondence with his wife and friends. He is not a good writer, but neither is he a very bad one, and he seems to know quite well the limitations of his powers. But the book was wholly written before the suppression of the rebellion, a great part of it was published long ago amid the heats of civil war, and it was published in England, apparently with a view of what used to be called enlightening foreign opinion in regard to the present struggle.

The biography, therefore, has glaring faults. The temper in which the writer entered upon his work puts it beyond his power to treat the enemies of the Confederacy and opponents of Jackson with anything like fairness, or even with moderation of hatred. Dr. Dabney himself, in his preface, very happily, though with unconscious felicity of phrase, characterizes the tone of his book. Controversial he probably meant to call it, but polemical is the word he uses, and it is only in the proverbial bitterness and unfairness of theological controversy that his biography can find its parallel.

Illustrations of this fact are abundant. "The Northern people," he says, "like the rabble of Imperial Rome, had became the *colluvies gentium*." The Confederacy being forced into war, was compelled "to wage the strife only on the cruel terms that the blood of her chivalrous sons should be matched against this *cloaca populorum*." Of McDowell's army at Bull Run he says: "The fanatical volunteers had supplied their pockets with halters, with which to hang the Southern rebels as soon as they were captured in battle." The intent of the party which elected Lincoln, an intent which that hideous party hardly affected to conceal, "was to oppress and enslave the humane master in order to exterminate the contented and comfortable servant." A Northern soldier, as a matter of course, is a coward; "the Federal is rarely found deficient in anything which cunning or diligence can supply; his defect is in the manhood of his soldiery."

Surely this is all very foolish in any man, and in a professor and doctor of divinity very contemptible. But the writer is thoroughly in earnest about it, and evidently believes it all. A Southern Unionist is in his eyes, and in his language, a miserable traitor, and a secessionist is a patriot. He is utterly unable to see why the Southern States could not rightfully secede from the Union, and equally unable to see that a view of the Constitution different from his and his hero's was possible. These political opinions of his, set forth as they are at great length, and seemingly for the by-end of instructing Englishmen and confirming Southerners in the secessionist faith, and being so violent as they are, and so strenuously held, make it very hard, not to say impossible, for any but an unthinking partisan to give credence to his statement of facts.

That the biographer belongs to the clerical profession we do not regard as a disqualification. Jackson interests us not merely as a soldier; the man's character even more than a scientific account of his remarkable military exploits is what most readers wish to know about, and what is most worth the study of ninety-nine readers in a hundred. This a clergyman can very well depict. Besides, Dr. Dabney seems not wholly a minister of the gospel; he is something of a soldier as well. We would say to him, however, that while the general reader is not apt to think the occasional presence of the clergyman an offensive intrusion, of the company of the Presbyterian clergyman, say, or the Methodist, or other sectarian, he can very easily see too much; and he is just as well pleased if the Roman Catholic priest is not called unevangelical and unorthodox, and then patronized a little, and if the Universalist chaplains are not dragged in to be denounced as "erratic heretics."

Amid very much, then, that is unnecessary, and for that and other reasons unpleasing, and while it is without any charm of fine literary workmanship, the book has this merit, that we can get from it what seems to be an accurate narrative of Jackson's life while Jackson was an obscure man, and an intelligible account of the growth and formation of his character.

He sprang from that Scotch-Irish stock which had already produced one of the most strongly marked characters in American history, and shared with Andrew Jackson the strong will and the strong sense characteristic of the blood. His father died poor, for he had been an improvident Virginia country gentleman, and soon his mother left her children orphans. Young Jackson was sent to one of his relations, and lived with him till he was eight years old. He then deliberately chose to leave the home that had become distasteful, and no expostulation could prevail on him to alter his decision. Another uncle received him, and before he was ten years old he had disappeared again. His brother and he found their way to the Mississippi and earned a living by cutting firewood for passing boats. Fever and ague drove them home. After these early proofs of determination and persistency, the boy contented himself till he was eighteen with his favorite uncle, leading the rough life of a farmer and horse-breaker and hunter in North-western Virginia. Then came West Point, where Jackson proved himself a man of strong and high character and of good parts. Had the course been two years longer, his contemporaries used to say, Jackson would have led his class. In the Mexican war he showed great courage and great skill and was noted for his exact observance of every duty. Then when peace came he resigned, and till 1861 was a professor in the Virginia Military Institute.

It was at Lexington that he made choice of his form of religion, and the choice which he made throws light upon his character. Catholicism he had before examined slightly and rejected. Episcopalianism seemed to him hardly Scriptural, but he was baptized into that communion with the understanding that he might soon leave it. Presbyterianism fully satisfied him. He became very firm in his belief and most strict in every observance. For example, he would never open a letter which came to him on a Sunday, nor ever, if he could help it, send away a letter which, in the ordinary course of mail, would have to make any part of its journey on that day. He seemed to delight in wearing the yoke of conscience and in making it heavy as possible. Special providences he believed in and prayed for, and he was not only constant but enthusiastic in prayer.

In all other things as well as in religion he seems to have been a man of definite, unbending rules, and of narrow beliefs, which he held with tenacity. A reticence of disposition that made him uncompanionable; a harsh honesty which could not accommodate itself to any trickery and hardly to the ordinary forms of courtesy; a certain stiffness of mind—an inability to adapt himself to the minds of his pupils, for example—which proved him devoid of imagination, were among his distinguishing traits, and underneath all was a tremendous force of will. "I can accomplish anything that I will," was his favorite maxim and perhaps his only boast, for he was a modest man. He was always a State-rights Democrat and a slaveholder, a master who "faithfully administered necessary chastisement."

He was not a man, we should say, as we read about him here, to be greatly loved, but the hard fibre of his unsympathetic nature which repelled love must always have commanded respect, and there was something to admire in the straightforward simplicity of his character. After 1861 these stern qualities had a conspicuous stage for their display, and he became the idol of the people for whose benefit they were exercised, and the terror of those against whom he turned his arms. This book, on the whole, enables one to discover underneath the gigantic figure of the Stonewall Jackson of the days of 1862 the man himself in something like his true proportions. By and by we shall probably have a really good biography, and for that reason, as well as for others above hinted at, we do not recommend the purchase of this one.

* "Life and Campaigns of Lieut.-Gen. Thomas J. Jackson (Stonewall Jackson). By Prof. R. L. Dabney, D.D." New York: Blelock & Co. 1866. Pp. 742.

THE MAGAZINES FOR JUNE.

The "Atlantic" opens this month with "Quicksands," a neatly-written but otherwise quite commonplace story, whose male and female personages respectively fight in the war against the rebels, rising rapidly to the grade of colonel, some of them, and knit and sew for the soldiers. The "Last Days of Walter Savage Landor" comes to an end in this number. Though lacking in literary merit, it has been exceedingly readable, and has added considerably to our knowledge of that remarkable man and not a little to our liking for him. "Passages from Hawthorne's Note-Books" are not yet exhausted and continue still to instruct us, giving us an intimate knowledge of the finest genius yet produced in America, showing us the union of the carefullest study of external nature and the laborious collection of material for future use with the remarkable fertility of his mind in those strange and grotesque conceptions which were so characteristic of his genius. "In the Hemlocks," by John Burroughs, is a particularly good sample of the work of one who has taken Thoreau for a guide but not for a model. The sincerity and fresh naturalness of his writing seem an emanation from the scenes in which he so greatly delights and, more than that, which he depicts so well. "Dr. Johns," that very pale reflection of what is popularly supposed to have been New England village life just before railroads made all the villages into suburbs and while the minister was still a power, gets to an end in its

seventy-second chapter. We may have it next in the form of a book. "Griffith Gaunt" is as brilliant as ever. Mrs. Stowe's "Chimney Corner" is duller this month than we remember it to have been before. If "Tied to a Rope" was called "Concerning being Tied to Ropes" its title would assign it to the class of writing where it belongs, for it is made up of the thin platitudes, and its tone has all the affected airiness and lightness which make the whole tribe of "concernings" so insupportable. "Bad Symptoms" is the same in kind though a shade better in degree, and the magazine would be all the better if it contained neither of them. We are rather at a loss for language with which to speak of "The Mountain." It eludes criticism unless one is a mere critic of words. Longfellow furnishes a sonnet, and Whittier the best poetry of the number.

In "Our Young Folks" we meet Mrs. Stowe again. Her "Mother Magpie," of course, has the excellent moral, but it is excellent in other respects also. Another very pleasant article, with an agreeable vein of humor, is "The Little Southerners." Besides these, which, though they will be read with pleasure by children of all sizes, are more especially meant for little ones, there is a variety of pieces suited to the different capacities of different ages. Mr. Trowbridge, for example, supplies an account of some Tennessee poor whites which will aid youthful politicians to form a body of opinions upon the social condition of the South. We presume it is the growing boy, too—Wordsworth's, perhaps—that so much natural science is for; and "A Summer in Leslie Goldthwaite's Life" seems to be meant for young ladies high up in high schools. The illustrations of this number are remarkably good.

We think the June "Harper's" a very fair number. In *Harper's Weekly* we have been for some time getting instalments of a story which, with some blemishes as a story, gives a very vivid and instructive picture of life in the South during the war. Information of this sort is no doubt valuable, and certainly it is eagerly read. The "Monthly" in its next few issues will contain a series of illustrated articles by General Strothers, the "Porte Crayon" of "Harper's" old days, which, judging them by this first one, will be an interesting contribution to such literature of the war. The general makes extracts from a diary kept at the time, and describes the first movements in arms of the Virginia rebels. We see how much of the rebel strength was the indecision and weakness of the Government. He saw Harper's Ferry destroyed, and was in Baltimore a day or two after the memorable riot. It sounds strangely now to read of "a Colonel T. J. Jackson, formerly of the U. S. Army, and latterly a professor at the Virginia Military Institute." Ross Browne treats of the Reese River silver mines in a paper which combines liveliness with statistics. Professor H. W. Draper gives an affirmative answer to the question: "Are there other inhabited worlds?" His reply is chiefly occupied with facts about the moon. In his opinion, there are no human beings—as we suppose we may say—living on our satellite, but it is likely that in some of the planets "conspiring circumstances may have allowed life to develop even beyond our standard." A chatty article about American studios in Rome and Florence has a few pretty good anecdotes amid much highly laudatory criticism. "Armadale" seems likely to come to an end; the last book is begun. A casual visitor to the House of Commons describes Gladstone introducing the new reform bill. There are no less than fourteen other articles, of which three are stories of love and three are in verse, the poorest in the two classes respectively being "Letitia" and "The Live American." The editor in his Easy Chair talks of Carlyle's Edinburgh address, not sparing its weaknesses. Also he controverts that view of Carlyle's present condition which he calls the one put forth in the April "North American." The assertion which the editor disagrees with is made in the review; but so, too, is the substance of his reply to it, and both views are there subordinated to a theory more exhaustive. The contents of the number must be considered varied and interesting, and they are mostly original contributions by American writers. Indeed, we suppose "Armadale" to be the only exception.

The managers of "Beadle's Monthly" "regard the June issue as one of the best numbers of a popular magazine ever issued in this country." We can hardly say just that, perhaps. It may be worth any one's while, though, to look into it for the sake of one person who actually contributes "Personal Recollections of Mrs. Caroline Lee Hentz." That writer of fiction he first saw in Columbus, Georgia, and she seemed to him "the most exquisitely dressed lady I ever met South." Her last novel, "'Ernest Linwood,' is mournful as a prophetic chant; her soul there seems pouring forth its last burning thoughts," etc. "Our Entrance into Richmond" derives some slight interest from its subject. On the whole we should have imagined that the sale of this magazine might have been seriously interfered with by the same publisher's series of dime novels, but we should have been mistaken; the magazine is a gratifying success in a pecuniary point of view.

The New Gospel of Peace, According to St. Benjamin. Book Fourth and Last. (New York: American News Company.)—In a particular sense it is true of parodists that the prosperity of their jest lies rather in the ear of him that hears it than in the mouth of him that makes it. It is so in this case. The sound of Scriptural language is familiar to us all, and we are all to some extent ready to be amused by the application of biblical phraseology to ordinary matters, our amusement being greater or less according as we feel more or less reverence for the Scriptures themselves. As for that, the national taste is probably not shocked even by the idea of a New York *Daily News* editor transformed into an apostle. American wit and humor, if we may believe its European critics, habitually allows itself a somewhat free handling of sacred things, and we ourselves think there need be no fear that the "New Gospel" will be exposed to the danger that threatened the Scottish Chaldee Manuscript—a prosecution as a "profane and ribald" travesty of Holy Writ. Where so much of the wit consists in the garb, the man who invented that is entitled to a good part of such praise as can be accorded this performance, and much of the merit of the "New Gospel," therefore, does not belong to the writer of it. It is hardly doubtful that we should not have had it if Hogg had not previously produced "The Chaldee." That famous parody is superior to this in other respects than priority in time. Its biblical style is better preserved, fewer of its expressions being modern. It will be found, too, that in its effect upon the ear the Manuscript is not different from what the reader finds it, while in the "New Gospel" much of the wit, if it can be called so, exists for the eye only, consisting in the very Scriptural look of words whose sound is even as the sound of the words of the book Deilighnuse, as St. Benjamin himself would say. But there are some strokes in it which certainly are good, as, for instance, where the obtuse British holders of Confederate bonds are described, and one of them gives the rest some counsel that is well pleasing: "And they all cried out Eereer and Oo-rae, which, in the tongue of the Hittites and Hammerites of Gotham, is Hi-hi and Bulhiphurewe." The account of the Fenians, also, is witty, bringing, as it does, into sharp distinctness the absurdities of the Union Square doings by a mere statement of them, changing practical into verbal bulls. Irishmen in general, "Pahdees," as he calls them, get no good words from him, and negroes he despises. Radicals fare little better. While he praises Seward highly, he calls Greeley the "chief of the Oueecneas," a title which, when so applied, is truly absurd. Women, we should say, had at some time ill-used him. They receive very hard knocks at his hands over the back of Jeph the Repudiator. Wits, who naturally ransack earth and heaven for the weapons of their armory, are not to be held so strictly accountable as other men for what they say. License and authority to destroy much that other men admire and respect, is almost a need of theirs. The mental picturesque, like that of nature, is often none the worse for a ruined temple or dwelling-place. And narrow prejudices, bitterness, contempt, hatreds, and other proofs, as the poet says, that the man who feels them has faculties within which he has never used—all these pitiable things may, in the case of the jester, be only seeming and not real; he may need them merely as the motley of the mind; perhaps he only wears that dress in fooling. It is but fair to think of this in reading much that our author says.

A complete edition of the "New Gospel," with explanatory notes, practical remarks, comments, and illustrations, is announced as being in preparation. It ought to be preserved and made a companion volume to Mr. Richard Grant White's "Poetry of the Civil War."

A Practical Homœopathic Treatise on the Diseases of Women and Children. Intended for Intelligent Heads of Families and Students in Medicine. By Henry Minton, M.D. (Blelock & Co., New York.)—The remedies of homœopathy, as everybody knows, are (none could be more so) simple, portable, and agreeable both to take and to administer. It is this fact which, we will not say as much as anything but largely, recommends the system for domestic practice, and in not a few places enables it to boast a popularity over all its rivals. Waiving the question of the soundness of its fundamental doctrine, it must also be admitted that the successes of homœopathy are nowhere more conspicuous than in its treatment of women and children, who certainly show the greatest susceptibility to its medicines. A work, therefore, like Dr. Minton's, must prove of peculiar usefulness in households which are prepared to make it their guide on due assurance of its trustworthiness. Such assurance in the present instance we believe we can safely give. "Intelligent heads of families," of either sex, will find not the least difficulty in understanding the descriptions and instructions of this treatise, which is written in a thoroughly familiar and untechnical style. The author says of himself that formerly there never was a more bitter opponent of the "vagaries" of Hahnemann. In the war of "potencies" Dr. Minton advises for laymen the use of the thirtieth, and adopts for himself, apparently, whatever experience has shown to be most efficacious in any given case. We differ from him in dissuading women from attempting to become practical accoucheurs, or rather in doubting their ability to cope with the most formidable emergencies of child-birth. We incline to the opinion that nature points to the opposite idea, and it will not be disputed that our colleges for female physicians are turning out yearly a large number of responsible practitioners, and that this number is steadily increasing. The author asserts quite broadly on p. 435 that "no *healthy* child sleeps on its back; and, when the child is found habitually sleeping in this position, no other symptom is necessary to assure the child's being in ill-health—the position itself being the result rather than the cause of disease." For our part, we remember to have seen very healthy children sleeping in the position here denied them; but what will be said of the infants of the aborigines, who are strapped upon a flat board, now hung upon the mother's back, and now inclined against a tree? Do the pappooses never sleep, or are they proverbially sickly? The whole question of the normal position in sleep, whether for children or for adults, offers a very interesting investigation. The individual mode of life and constitution affect this posture very variously

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

WHAT THE EUROPEAN WAR IS ABOUT.

WE may expect to hear now by every mail that nearly a million of men are engaged in hostilities in Germany and Italy, and that the whole of the European continent is shaken by the shock. There has not been since 1815 promise half so strong of a general war. It was not difficult, after all, to "localize," as it is called, the Belgian-Dutch war, or the Austrian-Hungarian war, or the Russian-Turkish war, or the French-Austrian-Italian war. These were all avowedly waged about interests essentially local, or else were so far removed from the great centres of European affairs that any of the great powers which chose to stand aloof could do so without difficulty. But this war which is on the point of breaking out will rage in the very heart of European civilization, and, though nominally for the possession of a strip of territory, is in reality waged to shape the future of one of the great races of the world, and to decide whether one of the oldest and proudest of European empires shall or shall not vanish from the map.

And yet nine out of every ten of our readers have probably no idea at all, or a very vague one, of what it is all about. There is a confused notion in the public mind that Schleswig-Holstein is somehow or other at the bottom of it, but how it got to the bottom of it, or why it remains there, very few indeed know. Most people have been deterred from following the Schleswig-Holstein controversy at all, owing to the general and not unnatural belief that it was incomprehensible. The efforts of most European journals to throw light on the matter have made it as clear as mud. *Punch* published a year or two ago an amusing burlesque on the subject, which was probably of as much value to most readers as the most serious of the previous attempts at explanation.

We do not propose to follow the dispute through all its ramifications. An "exhaustive" treatise upon it would fill several volumes. But the gist of it is this: The Duchies of Schleswig and Holstein are subject to the Salic law, which prohibits a woman from reigning. In 1460 they were inherited by the King of Denmark, and they remained in the hands of his descendants until the time of Frederick VII., who died in 1863; with him the direct male line terminated, and the duchies legally reverted to the young Duke of Augustenburg. In view of this contingency, however, a conference of the great powers was held in London, in 1852, at which it was resolved for various considerations affecting the peace of Europe, but perhaps from deference to Russia as much as any other, that the duchies should remain annexed to the Danish Crown and should not pass in the legal order of succession.

When the King died in 1863, however, it was found that the popular party in Germany were by no means disposed to acquiesce in the arrangements of the diplomatists. Holstein is German, and has always been a member of the German Confederation, though governed by a Danish prince, and there was a general outcry against its annexation to Denmark. The clamor grew louder every day, and at last found formal expression through the Diet, which ordered the King of Denmark to take himself out of Holstein. On his refusal, "federal execution" was ordered—that is, the troops of the Confederation were ordered to turn him out, and put the Duke of Augustenburg in possession.

Up to this point Prussia and Austria had stood aloof. The movement against Denmark being an essentially popular one, they would have nothing to say to it; but as soon as the troops began to move, they announced that if there was to be any fighting done, they would do it themselves, and would not allow the smaller states to interfere. By this time Denmark had yielded Holstein to the federal army; but Prussia now came in, and demanded Schleswig also, and sent the federal army about its business. Austria then sent troops to the scene of action also. Denmark prepared for resistance, Lord Russell swore by the nine gods that Denmark should not be harmed; but the Prussians kept marching. Düppel was taken in due course, and then a conference was hastily called in London, in May, 1864; but Prussia refused to suspend operations during its sittings. After a fortnight's wrangling it accomplished nothing, and it had hardly broken up when Alsen was taken, the war was over, and Denmark was prostrate at the feet of the invader. A treaty was made at Vienna in October of the same year, by which Denmark ceded Schleswig, Holstein, and Lauenburg to Prussia and Austria jointly, but Prussia bought out Austria's interest in Lauenburg for 2,000,000 thalers.

So far all had worked harmoniously enough. But the trouble was now to begin, as the spoil had to be divided. The two powers found themselves in the duchies what the German lawyers call *condomini*—joint rulers and proprietors. Each of them sent down a civil commissioner and a military commissioner, and these four officers speedily began to quarrel. The Austrian commissioner coquetted with the Duke of Augustenburg, and encouraged demonstrations of attachment to him on the part of the inhabitants; the Prussian commissioner forbade these demonstrations, and the bickering became so serious that an effort was made to terminate it diplomatically. The convention of Gastein was accordingly made in 1865, by which it was arranged that Prussia should hold Schleswig, the harbor of Kiel, and the federal fort of Rendsburg, and Austria Holstein. This was, however, simply a provisional arrangement; nothing was determined as to the ultimate disposition of the conquered territory.

In February of the present year, Bismark—who makes no secret of his belief that Austria has no business in Germany, that she is not a German power, that her proper capital is Pesth, and her proper mission the civilization of the barbarous countries of Eastern Europe—impudently and brusquely gave her notice that he wished her to evacuate Holstein. She was naturally somewhat taken aback by this arrogant demand, and declined compliance. About this time some disturbances broke out among the Jews in Bohemia. Austria moved troops up to restore order, and Bismark at once cried out that she was arming. She denied it; he insisted she was, and he at once began to put the Prussian army on a war footing and sent agents into Italy to stir up the Italians, and, it is strongly suspected, entered into a secret convention with Victor Emanuel. On perceiving the movement in Italy, Austria began to strengthen her forces in Venetia. Bismark affected to regard this as another threat and pushed on his preparations with greater vigor than ever, but offered to let the Austrian corps in Holstein retire unmolested. The "notes" which have been since interchanged are mere formalities. Prussia is clearly determined on trying conclusions with Austria, and the manner in which the quarrel has been begun and carried on leaves no room for an honorable exit to either party, nor does it seem that anything except Bismark's or the King's death could now avert an appeal to arms. The confident manner in which the Italians are moving to the attack leaves very little doubt that the whole programme is already made out.

It is, of course, impossible to predict with confidence the course events will take. But it is reasonable to expect that Austria will be driven from Venice and out of the duchies; that, at a later stage of the conflict, France will intervene and claim the left bank of the Rhine, permitting Prussia to compensate herself by the absorption of the smaller German states, and offering Austria the Danubian principalities to make up for her losses in Western and Southern Europe. This would make the latter less of a German and more of a Slavonic and Rouman power than ever, and would virtually convert Prussia into a German empire. But Russia may prove a disturbing element in this calculation, and, unless her domestic troubles are serious enough to tie her hands, would probably lay a strong hand on the principalities.

THE SPEECH AT AUBURN.

EVERYBODY has been for some days expecting a speech from Mr. Seward, and everybody has probably been expecting just such a speech as he has now delivered. Perhaps we ought to except that passage which attacks the civil rights bill and puts it upon an equality with the fugitive slave law, because it "unnecessarily arrays Federal courts and officers in conflict with the authorities of the States upon questions of individual property and liberty." The short answer to this statement, it is needless to say, is that the arraying spoken of was not unnecessary. And the moment the State authorities choose to make it unnecessary,

by ordaining the equality of all classes before the law, the bill itself disappears. But, although the odious comparison is a little surprising, even this attack might have been expected, for Mr. Johnson has made it over and over again, both before and since Mr. Trumbull's conclusive reply to it, and the Secretary and the President, it is pretty well known, are of one mind in the matter.

The speech naturally divides itself into three parts, of which two may be dismissed without any extended consideration. At the close, Mr. Seward defends the President from the charge of having been unfaithful to the party which elected him, and explains how he happened to send three veto messages to Congress. It is in this part that the civil rights bill comes in for attention, and here, too, we are once more told that Congress can turn out any members who, after admission, may prove to be disloyal, a statement in which this fallacy inheres, that the Congress which is to turn out will not be the same Congress which lets in. At the beginning we have a display of that cheerful good nature for which Mr. Seward is renowned. His optimism is almost as great as that of Hood's auctioneer, who poured out to his stage-coach companions as highly-colored descriptions of every parcel of real estate they passed as if he had been in the very act of deceiving people just previous to a sale at a sacrifice. His own references to his well-known hopefulness, we dare say, recalled the recollection of his ninety-day prophecies, and supplied some of his audience with an argument against perfect trust in the very rosy view which he gave them of the present. "The people of the South," he said, "have brought forward with alacrity the remains of their once-cherished institution of slavery, and cheerfully thrown them to be burned upon the constitutional altar which they had so newly restored." They "all at once renounced the principles, practices, and policy of secession; new constitutions were framed in harmonious agreement with the Constitution of the United States; everywhere throughout the South the Executive is obeyed; the various departments—among the rest the Post-office Department, by name—exercise their appropriate functions in every Southern State; the communities once rebellious have loyally sent senators and representatives to the Congress which they once despised, and their delegates are now awaiting the good pleasure of the two houses. The Union is restored, and the South is in the Union as much as it was in 1787."

Events such as these, the middle of the speech begins, have dictated a certain kind of restoration—a policy which grew out of the events themselves, a policy which the Constitution authorizes, which the President may have been the first to recognize, but which was certainly no invention of his. Nothing is needed now but to reconcile this Presidential plan of restoration with the Congressional plan; or, rather, as Mr. Seward takes pleasure in pointing out, to reconcile it with the many discordant plans which each find some favor in the eyes of some Congressmen. None of these schemes pleases Mr. Seward. The proposition to grant suffrage to the negroes, and that which bases representation on voting population, are put aside with a few words as impossible to be obtained, even if desirable. The report of the committee pleases him least of all. It is too harsh; it seeks to shuffle off the time of restoration; the delay is needless, and worse than needless, for Congress and the President differ only in respect to non-essentials, and the interests of the Union party imperatively demand that there should be no division in its councils.

But, unless he thinks himself well employed in confusing the public mind, Mr. Seward wastes his time when he argues at such length that the difference between the two plans is a difference in non-essentials merely. The Congressional plan, Mr. Seward must recollect, is not made. It is making. It will be made to suit the wish and will of the loyal people whose efforts alone made reconstruction of any sort possible. And between this plan, whatever it may be, and the plan which Mr. Seward advocates, there is at least this difference: one says to the South, Our right to impose conditions upon your return is perfect; the other, You are restored already; your right to immediate possession of all your powers in the Union is perfect. This difference in the underlying principles of the two plans Mr. Seward ignores. This is not a difference in non-essentials but in essentials, and sets the two plans wide as the poles asunder.

At the present stage of Congressional action it is easy for a clever speaker to show how little there is to choose between a scheme still under earnest discussion and not yet offered for the assent of the loyal, and another scheme which has been taken out of the region of controversy, put beyond the hope of improvement, and which, though it has obtained little support from loyal men, has called forth the enthusiasm of the disloyal. But the real wide difference is not to be explained away, and it is from this that we look to get a settlement of certain vital questions which it suits Mr. Seward to puff airily aside. Our faith in time is, like Mr. Seward's, very large, but that is not the wisest faith which trusts the centuries and lets the years and days of advantage slip.

LEGAL LITERATURE IN AMERICA.

No candid reader of treatises under both the common and the civil law has ever doubted the inferiority, in an æsthetic point of view, of law books prepared under the former system to those which are used under the latter. England and America have, even at this day, no legal treatise worthy of comparison with the works of Pothier, Merlin, or Savigny. It is even doubtful whether Kent or Blackstone deserves to be placed on a level with Bell's "Commentaries on the Law of Scotland," in spite of the quaint language frequently used in that work. In all standard treatises under the civil law there will be found a clear statement of first principles, from which the structure of the work is regularly built up, subordinate rules following vital doctrines in orderly sequence. In German treatises the subject is analyzed and arranged in a masterly way. Nothing is tucked away in corners; but every doctrine is provided with an appropriate place. In French treatises there is always manifest at least a respectable power of analysis, while the language of a French law book is as elegant, as accurate, and as lucid in style as that of any other literary production.

Contrast with this the legal treatises of England and America. One-half of them or more are mere compilations of reported cases, huddled together with but feeble efforts to reduce them to order. The rest are attempts to extract principles from the decisions, and to give the result of the authors' investigations in an original form. The latter class of books are undoubtedly founded upon the better theory of authorship; but, unfortunately, the *attempts* are many and the *successes* few. Rarely do our legal writers display much analytical power in examining or arranging their subject. Still more rarely do they venture to pursue a strictly scientific method. One author announces that his arrangement is based upon the natural sequence of events; another that he has sought to meet the expectations of the average of his readers as to where particular topics would be placed; another that he has distributed his subject with a view to accommodate the notions of nine-tenths of the bar; while one eminent writer candidly acknowledges that all he can say for his arrangement of a bulky treatise is that he has not found it extremely inconvenient, and hopes his readers will not.

A "treatise" published in Philadelphia a few years ago, and highly puffed by judicial and other critics, was made up entirely of long extracts from the published reports, cut up into sections of convenient length, and without any quotation marks to indicate where these extracts began or ended. The reader might go on for ten or fifteen pages wholly unsuspicious that he was reading borrowed matter. The cases cited in the judges' opinions are put into foot-notes, and the whole thing is managed with so much typographical ingenuity that it is almost impossible to comprehend the trick without comparing the book with the printed reports from which it is servilely copied. Another book is abridged from treatises upon the same subject, with such lack of independent thought that all their errors, typographical as well as legal, are copied into it. This book also has been made the subject of extravagant laudation. Many like examples, unfortunately, might be cited. We might mention books so manifestly made up from digests that one who reads both will find the cases cited in precisely the same order and all the errors repeated; books purporting to be new editions in which no change is really made from old editions; English books republished with American notes of the most worthless character, after entirely new editions had long been published in England with most important modifications; books with an average of half-a-dozen typographical errors per page, and what not.

Without dwelling further upon these flagrant impositions, we will illustrate our views by reference to some standard works which are too well established to be affected by criticism. Of these we may speak freely, without injuring their sale. The works of Judge Story, for example, have a value which cannot be destroyed by their defects, and are, indeed, accepted as authority worthy of respect, entirely apart from the citation of cases, upon

which most legal writers must depend. Yet every careful and intelligent student of these works freely expresses, in private, his dissatisfaction with their loose and vague statements, and with the great amount of repetition in them. The whole of these writings could be reduced to one-half their size with great advantage to all, except perhaps the publishers. Judge Story's work on notes consists mostly of the same matter as that on bills of exchange. His treatises on agency and bailments largely run into each other. His equity jurisprudence is very defectively arranged; the chapter on constructive fraud, in particular, being a perfect drag-net for all the material which he could not afford to lose, but did not know how to dispose of. Professor Parsons's work on contracts, which has been, we believe, one of the most successful American law books, is open to great objection on account of its arrangement, which cannot be explained upon any sound principle. Thus he puts the law of agency, trust, partnership, and even of commercial paper, under the head of "Parties," at the very beginning of his book, before entering upon the elementary questions of consideration and consent. The statute of frauds, and many other rules of general application, follow at the end of several hundred pages devoted to particular species of contracts. The late Mr. Sedgwick's able treatise on damages is also very ill arranged, and no one can feel any confidence, in consulting it, that he will find all the law on one topic in one place. These are among the most esteemed law books. Much more complaint might justly be made of the inferior class of treatises.

One great cause of the low condition of our legal literature is the almost entire absence of competent and fearless criticism. A law-book, so far as it receives notice in the newspapers or magazines at all, is always flattered. Few critics know much about law, and most of them think it safe to praise where they cannot possibly judge. Legal critics generally write their notices with a view to get advertisements rather than to enlighten their professional brethren. A very little candor brings down a storm of wrath from the publishers, who seldom fail to impute dishonorable motives to any unpleasant criticism. The critic's employer is often indisposed to sustain him in telling the truth, especially if it interferes with business. In the end, frank and even caustic criticism would be the best even for authors and publishers, while it would render an immense service to the profession at large; but this is a truth as hard to be received by the parties who suffer at first as the now acknowledged truth that the South will prosper more without slavery than with it.

Our ideas of the true method of preparing a law book may be stated in a few brief points:

1. A treatise should be carefully distinguished, in *fact* as well as name, from a mere digest. It should contain a statement of principles, not a mere series of applications of principle to practical affairs.

2. Every treatise should be confined to one subject. A book on sales should say nothing about the competency of parties to buy or sell. That belongs to the general subject of contracts. If it is repeated under the head of sales, it will be again under that of hiring, agency, insurance, etc., as in fact it always is, under the present system. So a certain book of practice makes a merit of including in itself a short treatise on trade-marks, which is in truth a blemish in the book.

3. The subject should be arranged in a scientific order. All general principles should be stated first. Thus, in a book on contracts, every rule which affects all kinds of contracts should be given before touching the peculiar law of sales, bailments, etc. All cognate subjects should be grouped together. Thus, in a book of practice, all the law of costs should be gathered in one chapter, and nothing should be said about costs in the chapters on motions or trials.

4. Citations of cases should be confined to the foot-notes. This is essential to elegance of style, and to preserve true originality.

5. All the reported decisions should be cited. Attention to this has been the secret of Prof. Parsons's success; neglect of it has consigned "Bouvier's Institutes" (one of the very best American law books in other respects) to comparative obscurity. English and American lawyers *must* have the reported cases. Idiocy in the text, with a full citation of cases in the notes, will carry the day against genius in the text, with a barrenness of citation.

6. Subdivision should be carried very far. A book divided into short chapters, and much shorter sections, is much more likely to be concise, clear, and pointed, than one having no divisions less than ten pages long.

7. Rules and theories should be positively stated. If, as is often the case, the authorities conflict with each other, attention should be distinctly called to the authorities on both sides; but the author ought to be able to express an opinion of his own in the text. A mere statement of the conflict of opinions, without any effort to discriminate between them, is the office of a digest, not of a treatise.

The quality of our law books is a matter of no small importance not only to lawyers but to their clients. Justice cannot be well administered where the current legal treatises are inaccurate, vague, or ill-arranged. All classes of society have a direct interest in securing a statement of the law in correct, comprehensible, and well-written books.

Fine Arts.

THE FORTY-FIRST EXHIBITION OF THE NATIONAL ACADEMY OF DESIGN.

[FOURTH NOTICE.]

In the South Gallery, near the best of Mr. McEntee's landscapes, hangs the better of Mr. S. R. Gifford's two pictures, "Hunter Mountain, Twilight." It is a very happily composed landscape. Little of the mountain itself is seen, except its *silhouette* against the twilight sky; but the bounding lines are beautiful, seemingly true to the character of the mountain mass, and the lines of the foreground slopes enforce and assist them. The strength of the picture is, however, in its color, which is harmonious and forcible. There is no landscape in the exhibition, with the exception of Mr. Vedder's smaller and very small "Monk in Tuscany," which is wholly equal in color to this very beautiful sunset piece of Mr. Gifford. Even Mr. Homer's "Bush Harrow," which we had to mention among figure pieces, good landscape though it be—although having something of that strangeness which Mr. Gifford's harmonies lack, to their loss—is not varied enough, does not contain quite enough notes, to equal wholly the "Hunter Mountain."

Mr. Gifford's other picture, No. 191, "An October Afternoon," is so inferior to its fellow that we do not care to dwell upon it.

Color is, indeed, the strongest point of our better American artists as a school, and favorably characterizes that school as compared with other schools whose training is higher and whose power of description and of drawing is incomparably greater. And yet completely successful compositions of color are as rare here as elsewhere. It is for these reasons that we greet, with a pleasure which no other success can cause, anything approaching to complete success in color. The painter whom we believe to be on the whole the greatest colorist among our landscape painters, J. H. Hill, is never represented in our public exhibitions nowadays, and several other men who can color have sent nothing this year. We are the more grateful to those who have sent us pictures which are *paintings*, indeed. It seems, though we cannot enlarge upon it here, that there are characteristics of the American landscape which may tend to make the coloring of our artists too positive and too highly toned for the highest merit. It is in a great measure because he resists this tendency that we think so highly of Mr. Hill's work. Delicacy, also, is force; delicate strength in color will not be very popular, but only this is great and true.

Mr. Vedder has two pictures, both several years old; we spell out 1859 in the corner of the larger. They are both Italian scenes, and both were presumably painted when the artist was in Italy. "Paysage Fiesolé," No. 288, is a very effective landscape, and gives with unusual fidelity interesting features of Italian scenery; it is remarkable, too, for local truth; it is the hill of Fiesolé and not another hill which has been studied. The little picture No. 238, "Monk in Tuscany," is a better picture, principally on account of the beauty of its simple bit of distance. The insufficient drawing, and especially the disregard of detail, not more characteristic of these early studies than of the painter's most recent work, seem to be *un parti pris*. Mr. Vedder is the most sensational of painters (we do not accept the newspaper meaning of words as the right one, nor abandon every good word that the newspapers spoil), seemingly content if he produces the sensation, or, perhaps, he would say the emotion, in the spectator's mind that his picture is intended to excite.

Mr. Kensett's "Lake George," No. 234, is in his best vein. No. 252, "Sunset on the Coast," belongs to a class of pictures in which he has not shown an equal skill. We think Mr. Kensett's work hitherto has been better in everything else that he attempts than in rough sea. So far as these two pictures represent him, it is certainly so. Not so faulty as are the representations of the sea by some popular American painters, this picture of the waves running up to break on the coast is very inadequate; nor does this insufficiency seem caused by the slightness of the painting, otherwise very noticeable, but by failure to seize the true character of the waves—of the electric, writhing, tossing crest, and the polished hollows below. But in No. 234 the calm lake, the mountain beyond, and the sky are invested with a peculiar charm which it is Mr. Kensett's privilege to bestow upon his pictures. Certainly it is not to be wondered at that these lake pieces of his are so popular, and popular especially among the more cultivated circles of society. And

yet it may be difficult to account satisfactorily for this favor in which they are held. Much of it is in the "breadth" of treatment which marks them. In the picture before us there are no side issues; the whole is as single and simple in aim as a sonnet ought to be, *teste* Mr. Lowell's "Phœbus." The sky is certainly a proof of great skill in the art of making pictures—no mean art and no common skill. Not even the largeness of the subject, broad lake, high hills, nearer and farther clouds, is allowed to disturb its unity. Moreover, there is a certain equalness of finish and of actual merit: the clouds not notably better than the foreground, nor this better than the lake and trees. Truth is not served with entire devotion. The picture is not carried far enough, neither in detail, nor in force, nor in gradation which would give force, for a rank among the best landscapes of America. The foreground, for instance, would not harm but help the picture if it had more in it. The clump of trees on the right might be much more varied and more tree-like, and better for the picture, too. It is not detail for its own sake we ask for or desire in such a picture as this, but detail for the sake of general effect. But the beauty of such a picture as this cannot be overlooked, and would be only enjoyable but for the too high relative rank to which it is commonly assigned.

Mr. Cranch's landscapes are usually well hung, and as all three are well hung this year, they are among those pictures which demand notice. It is hard to say what merit of No. 340, "October View in Ulster County," caused it to be put in a good place; not the drawing, for trees, clouds, foreground detail, stone wall, even, are badly drawn. Probably not the color, for, in spite of large masses of bright colors given by autumn trees, the tone of the picture is unusually gloomy and disagreeable, and the dark cloud on the left is a wonder of harshness, as untrue as it is unbeautiful. It cannot be any of those merits which we have found Mr. Kensett's picture to possess—they are not to be found here in any noticeable degree. In these respects other pictures may, indeed, be worse. No. 341 is probably worse, and worse in color as well; and if Mr. Cranch's picture were hung as high as it, and as high as the committee have hung other pictures better than either of these, 340 and 341 would pass equally unnoticed. In the case of No. 279, "In the Harbor of Venice," much of the merit or demerit of the picture depends upon the good or bad drawing of the boats, and there are few persons whose opinion on that matter can be considered final. Mr. Cranch, however, can hardly object to the conclusion that his Venice boats are probably as his Venice buildings. Of the total inaccuracy of his renderings of Venetian architecture we spoke last year. The failure to seize any of the essential characteristics of Venetian architecture, which is capable of positive demonstration, shakes the trustworthiness of all other reports of Venetian or Italian things. Mr. Alfred Fredericks in his romantic pictures rather misuses the beautiful art of Verona, but his work shows feeling for some of its beauties, and a student of Italian art is rather pleasantly reminded by the pictures before him of the architecture he has left behind. With Mr. Cranch's Venice it is very different.

Of No. 208, "The Frost King," there is little that need be said. If any one thinks it imaginative, we cannot prove that it is not. In respect to execution it is very feeble, but not more so than most of the work this artist exhibits.

Mr. Benson's cloud-painting is not better than in former seasons. There was a little picture at Mr. Avery's gallery during the winter which seemed to us better than other work of this painter's; but in the new "Cloud Towers," No. 40, there is no advance over the former picture of the same name, nor is the cloud and wave drawing other than very coarse and very formal—untrue, therefore, from several points of regard.

Mr. Frank Anderson's little picture, No. 482, "Peekskill Village," contains delicate and careful foreground and tree drawing, but is not what we have hoped for since last autumn's study. The sky, however, seems to hurt the picture, which would be more beautiful, at least, if this were purer and brighter and had clouds of somewhat more decided character.

Miss McDonald's pencil-drawing of a cat, No. 83, is very minutely and very truthfully drawn, up to a certain point; it lacks in force and is "flat"—that being the almost uniform fault of those who are trying in earnest to draw what they see exactly as they see it. In the little water-color landscape, No. 78, there is an approach toward mastery of the material and of the subject, and the pure tones of the drawing make it very pleasant to look at. The rather uninteresting house and fences are made picturesque by the careful treatment of the shadows. But the tree-branches ramify in a very meaningless way, are very insufficiently drawn, indeed, and the clouds are a serious injury to the picture, being very much like flakes of cotton.

Mr. R. J. Pattison's pictures, six in number, are all small studies of foreground detail on rather a larger scale than usual. Of these the best seems to be "The Young Mullein," No. 43, in which the mullein itself is painted with remarkable success. The bird in No. 437 and the tortoise in No. 448 are excellent, and very faithful portraits there can be no doubt. But, as pictures, all these are hurt by the absence of any distinctive brilliancy of light. An uniform daylight seems to have been everywhere diffused when they were painted. The color is but poorly harmonized, and is not brilliant. This indeed seems to us Mr. Pattison's least strong side.

BOOKS OF THE DAY.

TICKNOR & FIELDS.

THE QUEEN MOTHER AND ROSAMOND. Algernon Charles Swinburne. 16mo. Adv. below. Repub. Rev. p. 549. 2 00

THE SOUTH SINCE THE WAR. Sidney Andrews. 16mo. Adv. below. Rev. p. 532. 2 00

THE MASQUERADE AND OTHER POEMS. John G. Saxe. 16mo. Adv. below. Noticed p. 614. 1 75

Just Published.

FAITH WHITE'S LETTER BOOK.

Pilgrim history will never tire nor grow old. Every fact relating to the eventful scenes through which our forefathers passed is a foundation-stone in our national edifice, and strikes a chord of tenderest interest in each American heart. The passage of years should only bind the nation, now almost in the noontide of its glory and strength, with stronger bands to the principles which led our ancestry to exchange homes of ease and refinement for the stern realities which awaited them on the shores of Plymouth.

The name of the work is significant of this central fact in our ancestral life. Faith White was the sister of Peregrine White, whose birth-place was the *Mayflower* in mid-ocean; and her "Letter Book" is a narrative of the trials preceding and subsequent to the "landing." Like a hive of sweets, it is filled with gems of rarest excellence, and seems almost embalmed in an atmosphere of pure and holy interest. Once begun the reader will hardly lay it aside till finished. It is a choice contribution to the Christian literature of the age, and will hold its place when more pretentious works have passed from sight and are forgotten.

Elegantly bound, gilt tops and illustrated, price $2.

Sent by mail, prepaid, on receipt of the price.

FINANCIAL REVIEW.

NATION OFFICE, Thursday Evening,
May 24, 1866.

THE past day or two have been a period of unusual excitement in Wall Street. The financial panic in Europe, which has brought down the house of Peto & Betts, and, it is feared, other houses and institutions more or less connected with this country, has had the effect of stimulating specie exports from this side at a rate wholly unprecedented. Five millions were shipped yesterday, making fourteen millions in ten days; and on Saturday a further amount of from three to five millions will probably go out. These arrivals will, of course, relieve the pressure in England, if it has not subsided by the time they reach their destination. On receipt of the *Cuba's* news by telegraph, on Monday last, at 4.30 P. M., a rush was made for the gold-room, and in about half an hour the Government broker sold not less than fifteen millions of gold at 130⅛ and 130¼. On the following morning he appeared in the room. The price was then 132. It fell, on his appearance, to 131¼, at which price he sold a million. He was then called away by orders from Washington, and he has not been a seller since. His total sales, in the past ten days, have been about $32,000,000. When it was ascertained that the Government would sell no more, the speculators quickly bid up the premium. Yesterday, 139 was touched. To-day, at 3 P. M., the price stands at 139¼.

These heavy sales of gold by the Treasury have led to an active demand for money. On Tuesday the market was active at 7; yesterday it was stringent, and there are no signs of an abatement of the pressure to-day. Of course, a stringency caused by a temporary enquiry for greenbacks, which are to be disbursed almost as soon as they are received, cannot last long. But it has already lasted long enough to cause great inconvenience in Wall Street and a pretty general decline in stocks. Prices of produce are generally higher on the advance in gold, but their upward tendency is checked by the difficulty of negotiating paper. The best names, on short paper, are not readily sold even at 7 per cent. For money on call as much as 7 and a commission was paid yesterday.

In the stock market the cliques which have been carrying large loads of fancy stocks at high prices, in anticipation of a fresh speculative outburst, have been sorely tried within the past day or two. The Rock Island and the Fort Wayne cliques have both been forced to sell, and both stocks have declined materially. Should the money market be relieved, these stocks will naturally react; if the pressure continues a day or two longer, a further decline may be anticipated. Erie has sold as low as 66¾, partly on the activity of money and partly on expected arrivals of stock from England. When foreigners learn that there will be no July dividend, they will rush to sell their stock, and very low quotations will probably be made. New York Central, which is in the hands of the Prairie du Chien clique, has been held with considerable firmness, having only fallen 2 to 2½ per cent. The calculation of the bulls is that the present stringency must be followed by a return of great ease in the money market, and that if they can bridge over the next few days, they will be in a position to reap the reward of their schemes. Hence they are willing to pay a usurious rate for money rather than sacrifice their stocks. Governments are all lower, partly on forced sales by speculative holders, and partly on sales of foreign stock. The Sub-Treasurer has given notice that interest on debt certificates will be stopped on the 31st.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	May 17.	May 21.	May 24.	Advance.	Decline.

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

J. W. & H. JUDD, GENERAL AGENTS.

92 BROADWAY, NEW YORK.

ACCUMULATED FUND.....$2,000,000.

ANNUAL INCOME.....$1,000,000.

PURELY MUTUAL.

ANNUAL CASH DIVIDENDS.

At the request of their numerous policy-holders, this Society have determined to declare their dividends ANNUALLY IN CASH: the first Dividend will be declared February 1, 1867. The last Dividend declared on the quinquennial plan reduced the premiums in some cases more than 50 per cent., or doubled the policy during the next dividend period. It is believed, for the future, that no Company in this country will be able to present greater advantages in its dividends to persons assuring than this Society, as its total expenditure to cash premium received was, by the last New York Insurance Report, less than that of any of the older American Life Insurance Companies.—*See Superintendent Barnes's Annual Report*, 1865.

The new business of this Society for the past year ($13,623,900) exceeds the new business of any New York Company in any previous year.—*See Superintendent Barnes's Annual Report*, 1865.

Hereafter Dividends on the first annual premium may be used as Cash in the payment of the Second Annual premium, and so on thereafter the dividend on each premium may be applied to the payment of the next succeeding premium. Policy-holders in most other Companies MUST WAIT FOUR OR FIVE YEARS before any advantage can be derived from Dividends.

The success of this Society has not been equalled by any Company either in this country or Europe, the Society's cash accumulation being over

ONE MILLION OF DOLLARS

greater than the most successful Company at the same period in its history, and its annual cash revenue from premiums, at the end of its sixth year, was greater than that of the largest company in the country at the end of its fifteenth.

Non-Forfeiture of Premiums.

In the case of whole life and endowment policies at ordinary ages in force for at least three years, the Society will, on due surrender, issue a Paid-up Policy for the full amount of premiums paid.

The Company will issue Policies on a single life to the extent of $25,000, but only in cases where the physical condition and family history of the applicant are entirely unexceptionable.

Permission is given at all times to visit Europe free of charge.

Extra Permits granted at moderate rates.

THE NATION

Was, when started, essentially an experiment. Journals of a similar character had been tried and had succeeded in Europe, but the idea that there was enough interest felt here in literature or in art to support a paper mainly devoted to the discussion of literary and art topics, or that there existed what economists call an effective demand for any more careful or more general discussion of political news than writers of the daily press working between dusk and dawn were able to supply, was scouted by many. Our experience, so far as it has gone, satisfies us that it is this want of faith rather than want of appreciation which is the greatest difficulty which any such journal has to contend with here. Thousands enjoy it for the one who believes that his neighbors will enjoy it, and, of course, any very widespread doubt of its success increases the difficulty of succeeding.

For the guidance of those who may feel disposed to assist us with their contributions, we may mention that the contents of THE NATION will fall nearly under four divisions—or that, at all events, these divisions would have to be kept in mind by anybody writing for it as a volunteer.

1. References to, and concise comments on, the news of the day, with the view of fixing the degree of its importance, and suggesting its bearings upon and relation to the main current of contemporary history.

2. Reviews or comments, whether in the shape of letters or articles upon important events, and upon the utterances of those who are, or are trying to be, leaders of public opinion.

3. Accounts more or less detailed, or discussions of such occurrences in the social, literary, artistic, or scientific world as are likely to interest men or women of education and intelligence. Under this head we do not include mere gossip about nobodies, or advertising chronicles of the sayings and doings of quacks, daubs, penny-a-liners, dilettanti.

4. Critiques of publications or works of art of sufficient merit to make it desirable that the public should ever hear anything about them.

TERMS—$5 per annum; 6 months, $3.

When delivered by Carriers in New York or Brooklyn, $1 additional.

JOSEPH H. RICHARDS, Publisher,

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.

Topics of the Day.

THE speech of Senator Stewart on Thursday, touching the reconstruction amendment, was admirable in many respects, and particularly so in its statement of the real relation of parties and its frankness in meeting the issue avoided by the Committee of Fifteen. In effect, as he says, the Union party is the party of negro suffrage, the Democratic party the opposite; and the former may count on the sympathy of mankind. To exclude the intellectual heads of the rebellion from office and a loyal population from the ballot-box is only to raise up new and baser leaders for the disloyal. Therefore the senator was in favor of abandoning disfranchisement for enfranchisement as the efficient safeguard against reaction. We believe that this is not merely the language of statesmanship, but that it only needs to be adopted by Congress to secure the general assent of the people, among whom, of course, we do not reckon the people of the States that revolted, because we do not hold their assent necessary to any constitutional amendment, and because none that would best serve the interests of the country would ever receive their voluntary adhesion.

THE bill for the equalization of bounties which passed the House on Friday obtained the enormous majority of 137 in a house of 141. This was partly owing to what has been called "the tyranny of the previous question." Still, the House would at any rate have passed a bill with the main features of this one and passed it very likely by a majority as large. Both parties voted for it, of course, even such Democrats as Mr. Le Blond and Mr. A. J. Rogers being desirous of giving bounties to the soldiers and sailors—a practical endorsement of the war which may, perhaps, give their wing of the party the right to be styled War Democrats in future. The bill gives $8 33⅓ a month to each soldier, sailor, and marine for every month between April, 1861, and April, 1865, during which he was disabled by wounds or was in active service—provided, however, that from this sum be deducted all the bounties which have been already paid, or are now payable, by the United States, or by any county, city, or town. It will probably add to the burden of the public debt the sum of $200,000,000, or even more, and we believe that the men for whose benefit the bill pretends to have been passed would themselves defeat the measure if it were submitted to them. No class of the community has been anxious for it except the politicians, and they, whether of the one party or the other, are loud in its advocacy. It is said that the fate of the bill in the Senate is by no means beyond a doubt—an assertion which is so far honorable to that body.

FEW persons have any but a vague idea of the injury directly inflicted on American commerce by the operations of rebel privateers. It is even rather surprising to learn that the Confederacy, first and last, had no less than twenty-five armed vessels engaged in these depredations. $25,546,000 is the estimated value of all the vessels of all kinds captured, and the value of vessels and cargoes not bonded and released, but actually destroyed, was $20,088,000. The total number of vessels taken in this way, by the enemy, was 283; of which 6 were steamers, 81 ships, 83 barques, and 70 were schooners. The *Alabama* was, of course, most destructive. It will interest both Englishmen and Americans to know, and we hope, eventually, Englishmen still more than Americans, that her captures numbered 69 vessels, worth $9,750,000. Next in number of victims comes the *Shenandoah*, with a list of 38 vessels, worth $2,888,000. But the captures of the *Florida*, though only 35 in number, were worth considerably more, being valued at $4,054,000. New York was the greatest loser, 41 of her vessels being captured; but New Bedford suffered more, for of her smaller marine 28 vessels were taken. Philadelphia and Boston lost 12 each. For these facts we are indebted to a statement whose accuracy is not doubtful, compiled by the acting secretary of the New York Chamber of Commerce.

THE latest legislation of Tennessee is in striking contrast with her legislation of only one year ago. She has just passed a law which re-enacts the civil rights bill and makes her black citizens equal before the law with the white. This is another not uncertain indication of the change which has been rapidly going on in the general sentiment of the country. Whether or not the improvement has already proceeded so far in Tennessee, in the region round Memphis, for instance, that Assistant Commissioner Fisk was quite justified in forthwith abolishing the Freedmen's Courts throughout the State, is a question which, in view of that officer's past course, we are not entirely unwilling to leave him to answer. He will be ready to rectify his action if it proves mistaken.

A PART at least of the people of North Carolina admit that their present assembling in adjourned convention is due to the belief entertained in October last that "by possibility, in the course of events, further action in the premises might be required or demanded by the President of the United States." But whereas these expected demands have not been made; and whereas, therefore, the October convention, it seems, did satisfactorily accomplish the purpose for which it was called; and whereas, by consequence, civil law is, as it ought to be, paramount; therefore, it was moved that the convention should at once adjourn. But this, by a vote of two-thirds of its members, it refused to do, either the premises or the conclusion failing to command assent. The conclusion, probably, for the message of Governor Worth, the choice of a majority of North Carolinians, asserts principles not much different from those of the resolutions, and demands immediate admission for North Carolina senators and representatives. Having made very good terms, this State naturally feels disposed to insist on them.

A FORTNIGHT ago we gave a description of Dr. Andrews's latest and perhaps greatest invention, the flying ship. His first trial-trip has been made and the vessel is said to have behaved exceedingly well. We

have only the report of the inventor himself and his friends as to the details of the ascent, but this at least seems certain, from the testimony of observers, that the ship did not drift slavishly with the wind and was repeatedly turned in different directions—in other words, momentum was given to a balloon and its course was changed at the will of its passengers. These are great advances in the art of aerostation; they are advances so great as to open a new epoch in that art and perhaps in the whole business of travelling.

THE Washington *Intelligencer* has recently discussed the Jefferson Davis trial in an elaborate article, and, with regard to the probable result of the trial, has arrived at the conclusion that it must be one of the three things—a verdict of guilty, or a verdict of not guilty, or the disagreement of the jury. This reminds us of "the Irishman" who, on being congratulated by a friend on the birth of a child, and asked whether it was a boy or a girl, requested him to guess. He guessed a girl, and on learning that he was wrong said, "Then it was a boy." "Ah!" said the father, "somebody tould ye."

MR. RAPHAEL SEMMES—or, as some of the papers now call him, "Ex-Pirate Semmes"—has gone to Washington to qualify for the office of probate judge at Mobile, by getting himself pardoned. He and his friends seem to have forgotten that this little formality is a necessary preliminary to the assumption of all offices of honor and profit at the South. It costs so little both in money and time that there is no excuse for omitting it, even in the case of the most hardened rebel.

OUR list of exchanges having become inconveniently large, we have with considerable reluctance reduced it.

THE military movements in Europe are beginning to assume a strategic character. At last accounts bodies of Austrian troops occupied the northern—Bohemian and Silesian—frontiers of the empire; a Bavarian army was approaching the confines of Bohemia, probably for co-operation with the Austrians; the Prussians were massed on the borders of Saxony, threatening an invasion of that kingdom; considerable transfers of troops were taking place in Venetia, and the Italian naval squadron was reported to have taken up a position between Ancona and Grossa, an island near the Dalmatian coast, thus blocking up the entrance to the northern part of the Adriatic, and, so to say, beginning the blockade of Trieste, Venice, and Fiume. Garibaldi had accepted the command of the Italian volunteers, the Senate had concurred with the Chamber in granting extraordinary powers to the King, and the enthusiasm of the people was still on the rise. Parts of the Austrian empire, Bohemia and Galicia, also evinced great alacrity for the war, while public opinion in Hungary seemed to be in suspense, to be decided by the Emperor's determination to restore or not to restore the liberties of the country. The impression was that Francis Joseph was about granting Hungary a responsible government in accordance with the laws of 1848, and placing it under the regency of the Empress. The armaments and works of fortification were pushed forward with increased energy. The Prussian ambassador was on the eve of leaving Vienna. A conditional treaty had been concluded between Prussia and Italy, and a threatening note addressed by the latter power to Hanover, demanding disarmament and a strict neutrality. The military occupation of both Hanover and Electoral Hesse by the Prussians was expected. Public opinion in Prussia, however, seemed to be little in accordance with the warlike efforts of the Government, and earnest demonstrations in favor of peace were not wanting. The Rhenish province was particularly alarmed on account of the war, threatened as it is by French invasion. To gain the favor of the majority of the people, Bismark, it was stated, intended modifying his cabinet on the basis of a coalition with the Liberals. Demands for the convocation of a German parliament were loud throughout Germany; in Vienna the re-assembling of the Reichsrath was urged by the independent press. A conference of ministers from the minor German States was assembled at Bamberg.

CONGRESS.

WASHINGTON, May 26, 1866.

THE slow progress of debate in the Senate upon the problem of reconstruction, as presented in the report of the Joint Committee, is impatiently criticised by many. All of this week was to have been devoted to this measure, instead of which but three speeches have yet been made, and the vote upon it seems very remote indeed. Two prolonged caucuses of Republican senators have failed to agree upon united action, and another is to be held, the object of course being to avoid the semblance of division in their public action in the Senate. It appears to be nearly certain, however, that the third section, embodying the futile disfranchisement until 1870 of the participants in rebellion, will be abandoned.

The House has made fine progress with practical legislation, having about finished the tax bill. Nearly all the amendments hitherto made having been in the direction of a reduced revenue, a step in the opposite direction was yesterday taken by restoring to the bill the ten per cent. tax upon all incomes over $5,000 per annum. The publication of the income returns in the newspapers has been put an end to, the argument being that it is inquisitorial.

DIARY.

May 23.—In the Senate, the constitutional amendment reported by the Joint Committee on Reconstruction was taken up. Mr. Sumner favored postponing action upon it until July 1. The Senate determined to proceed with the discussion, and Messrs. Howard and Wade made speeches. Mr. Clark moved as a substitute for the disfranchisement clause, that no person who aided the rebellion shall ever hold office under the United States. Mr. Wade offered a substitute for the whole bill, providing that no State shall abridge the rights of any person born within the United States, and that no class of persons as to whose right to suffrage discrimination shall be made by any State except on the ground of intelligence, property, or rebellion, shall be included in the basis of representation.

In the House, the tax bill occupied the day and evening. It was amended so as to exact an income tax of 10 per cent. on all sums over $5,000, leaving those below $1,000 free from tax, and taxing incomes from $1,000 to $5,000 5 per cent.

May 24.—In the Senate, a special committee was ordered to report upon Government deposits in national banks. The House bill relating to appointments to the West Point Military Academy was amended so as to require the nomination by each Congressman authorized to appoint cadets of not less than five persons, out of whom the selection of one shall be made according to merit and qualifications, under rules prescribed by the Secretary of War. Mr. Stewart spoke three hours on the constitutional amendment favoring the extension to the States lately engaged in rebellion of all civil and political rights, on condition of their extending impartial suffrage to all their people. Mr. Johnson moved to strike out the third section. Mr. Sherman offered a substitute for the second and third sections, apportioning representation according to the number of male citizens qualified to vote by State laws, and apportioning direct taxes according to the value of real and personal property.

In the House, the Senate amendments to House joint resolution to prevent the introduction of cholera were concurred in. The bill to amend and continue in force the Freedmen's Bureau act was taken up. Mr. Stevens moved to strike out a provision authorizing the purchase of land at $25 an acre to supply homes in lieu of the freedmen's lands now occupied under Gen. Sherman's field orders, and to insert a provision that no such lands shall be surrendered. Adopted—yeas, 79; nays, 46.

May 25.—In the Senate, the House joint resolution relative to appointments to the U. S. Military Academy was passed.

In the House, the bill for equalization of bounties, by paying to every soldier of the United States at the rate of $100 per year of actual service, deducting therefrom what has already been received from local or national bounties, was passed—yeas, 139; nays, 2. The tax bill was discussed and amended, the House rejecting an amendment to reduce the tax on spirits from $2 to $1 per gallon.

May 26.—The Senate did not sit. The House spent the day on the tax bill.

THE FREEDMEN.

THE colored people of Wilmington, N. C., have forwarded through Gen. Howard to the President a petition, signed by upwards of one hundred and twenty-five colored men, praying the President that he "will scrutinize well the accusations which are made against" the officers of the Bureau in North Carolina "by our enemies, and withhold condemnation until the truth can be developed. We pray you not to let *our stronghold of defence* be stricken down." They moreover state that they have learned with regret and pain that those officers have been placed in arrest who were engaged in the cultivation of the land; that these agents were earnestly solicited to this work by the planters and by the freed people, in order that the free labor system might have an opportunity of development. They speak with great praise of Majors Wickersham and Mann. This petition was prepared and forwarded without the knowledge of the Bureau. Gen. Whittlesey has been relieved and Gen. Ruger ordered to perform the duties of assistant commissioner in addition to those of military commander.

Notes.

LITERARY.

THE recent fire at the Academy of Music was disastrous to science as well as to music. In the Academy itself the orchestral scores of many operas were burned, as well as a large amount of costumes and scenery whose loss will be felt by no one but the owners, as they were very shabby. But there were destroyed in the University Medical College the valuable museum of anatomical and surgical preparations prepared by the late Dr. Mott; anatomical and medical collections belonging to Drs. Post, Bedford, and Van Buren; a very large herbarium made by Dr. Paine; and the mineralogical, geological, and botanical museum of the Lyceum of Natural History. The loss of Dr. Draper is still more severe. His library and his chemical apparatus, his delicate and costly instruments, are all gone; and, worse than all, his unpublished notes containing the results of researches and experiments for thirty years. The glasses of the large telescope of Dr. Henry Draper, with which he took his beautiful photographs of the moon, were also destroyed. By another fire last Thursday night, at 654 Broadway, Mr. Scribner's book-store was very greatly damaged by water. Mr. Scribner had recently removed his establishment to Broadway and was about getting settled. A large number of beautiful editions of English books had been just sent over by Mr. Welford, but many of them, we are glad to learn, were still in the Custom House. His loss on books can hardly fall short of $30,000.

—Mr. Payne Collier has lately discovered a very interesting manuscript, once the property of Sir Christopher Hatton, as his signature attests. It consists of the instructions given by Thomas Norton (who, conjointly with Sackville, wrote the tragedy of "Gorboduc"), then Remembrancer of the city of London, to the Lord Mayor of that time (1573), for the proper discharge of the duties of his office. Several new facts in Norton's biography are elicited by this document—that he was Remembrancer, that he sat in Parliament for the city, and that he was born in London, and not at Sharpenhoe, Bedfordshire, as commonly supposed. It is a valuable illustration of the state of London at that time, for it goes carefully over the whole city and shows the abuses that needed reforming. One singular point is that the author of the first blank-verse tragedy condemns without reserve all public dramatic exhibitions, and inveighs especially against the performances of a set of Italian women-tumblers. The document will be printed by Mr. Collier. He has just issued Nos. 19 and 20 of his specimens of "Old English Literature," consisting of Hubbard's unique poem "Ceyx and Alcione," and the earliest English prose autobiography, Venard's "Apology for his Life" and for his early dramatic entertainment produced in 1602, called "England's Joy."

—The success of the explanations of the Grecian and Eastern myths by the comparative mythologists has led enquirers to investigate with more care the mythical and romantic stories that are floating everywhere, and are applied now to one person and now to another. We know that anecdotes circulate around the world with blanks ready to be filled in with names and dates, and we often hear as of recent occurrence stories that were told by Greeks and Indians. The story of William Tell is the story of Palnatoki, though the Swiss romancer probably never heard of the Sanskrit legend. Both belong to the common story-fund of the world. The romantic histories of the Saxon kings which we find in William of Malmesbury and Roger of Wendover, so amplified from the meagre accounts of the Saxon Chronicles, are now being studied and the kernels of fact are being eliminated. Mr. Edward A. Freeman, in a late number of the "Fortnightly Review," performs this unshelling process on two English tales, the supposed murder of Ædwine by his brother Æthelstan, and the legend of Eadgar, Æthelwold, and Ælfthryth. The first took its rise from the mere circumstance that Ædwine was drowned at sea, and the second from the probable fact that Eadgar married the widow of Æthelwold soon after his death, and probably against some canonical rule. These stories were founded on early ballads. It is interesting to see how in the legend of "Ædwine" there is introduced the stock story of an accusation by an unfaithful servant, the finding out of the truth, and the subsequent punishment of the traitor. The same story is repeated about King Ædward and the murder of his brother Ælfred on the accusation of Earl Godwine, and the subsequent death of the earl. It is of great advantage to compare these stories, as well as those of Wallace and the Bruce, and the legends of Charlemagne, with what we know to be real historical facts. In this way hints are given us as to the method of dissection of those classical myths that rest on a quasi-historical basis.

—After the revolution of 1848, the provisional government published a large quarto volume, with M. Taschereau as editor, entitled "Revue Rétrospective ou Archives Secrètes du Dernier Gouvernement." In this was included all the most confidential correspondence of the ex-king, his family, ministers, and ambassadors, that the government could find in the royal palaces. M. Guizot, in his "Mémoires," gives many particulars of the domestic life and personal character of Louis Philippe. Since the death of the ex-Queen Marie-Amélie there have been published portions of a series of letters from the king to his sister, Madame Adélaïde, which escaped the grasp of M. Taschereau in 1848. They extend from 1839 to 1845, and embrace all sorts of topics, from his first impressions of Lord Palmerston's Eastern policy to the minutest particulars of his domestic life. They are written without any constraint to this sister, who exercised such a powerful influence on him, and are mere off-hand and familiar talk. We see here all the anxiety of this citizen-king, this "commis-voyageur de la maison Orléans," as Heine called him, for the welfare and safety of his children and grandchildren; his troubles during the illness of the Comte de Paris, who would be very hungry and cry for "soufflé;" his annoyances caused by the gardeners at St. Cloud and the architects at Fontainebleau. He tells of his arrangements for a review, in which he speaks of his desire of pleasing "ce bon Cass," as he styles the American minister; and of the suitors who come for the hand of the Princesse Clémentine, whom he nicknames Clem. We hope the whole of the letters will be published, as they are valuable illustrations of the peculiarities and foibles of a king whose motto was "Never mind."

—The great work of Dr. Bastian, "The Nations of Eastern Asia—Studies and Travels," will soon be published in five volumes. The first volume will bear the title of "The History of the Indo-Chinese," and is based on their historical books and oral traditions. The author is trying to fill a void that has existed already too long, and has availed himself of a long stay in Further India to collect materials, both written and oral. The second, third, and fourth volumes will contain the journal of his travels in Burma in 1861, his residence in Siam and travels in Cambodia and Cochin China in 1863, and his journey through the Archipelago to Japan and China, and by the overland route from Pekin through Mongolia and Siberia to the Caucasus in 1864–5. To illustrate the literature of the nations of Eastern Asia, translations of their poems, romances, and fables will be given. In the last volume the author purposes to show the present state of Buddhism as it exists in South-eastern Asia, and as he saw it in his intercourse with the monks, and a comparison of it with Foism and Lamaism.

—One of the best Hebrew scholars of Europe has just died, Dr. Hupfeld, professor in the University of Halle. He was born at Marburg, in 1796, and early devoted himself to the study of philosophy and theology. In 1819 he became professor in the Gymnasium at Hanau. Having resigned this office in consequence of ill-health, he went to Halle and became a pupil of Gesenius. After a professorate at Marburg, on the death of Gesenius he was chosen his successor. He was the author of a Hebrew grammar, a work on the authorship of Genesis, and a commentary on the Psalms, besides minor works on topics relating to the Oriental languages and to Biblical criticism. His death, which took place suddenly on the 24th of April, leaves a place hard to be filled, as Hebraists are becoming every day rarer.

—At the city of Etchmiadzin, near Mt. Ararat, the seat of the Armenian Patriarch, there exists a splendid library of about 3,000 Armenian manuscripts, which has hitherto been inaccessible to scholars. A catalogue of the library has been prepared, the MSS. are thrown open to scholars, and notice has been given that extracts will be sent to the learned in all parts of the world who will pay the expense of copying them out. Among the works in the library are unpublished books of the Fathers, and unpublished fragments of Aristotle and Diodorus Siculus.

—Members of the Health Commission and others interested in the utilization of the sewage, a subject which is rightfully attracting much attention abroad, will be glad to learn that an exhaustive treatise on the subject has just been published at Zurich by the city engineer, A. Bürkli, with the title, "Ueber Anlage städtischer Abzugskanäle und Behandlung der Abfallstoffe aus Städten."

—Messrs. D. Appleton & Co. announce reprints of David Masson's "Recent British Philosophy;" "The Conversion of the Northern Nations," by Charles Merivale; Dr. William Smith's "Old Testament History," and Miss Yonge's "Dove in the Eagle's Nest;" also a translation of Carl Ritter's "Geography of the Holy Land," an edition of Bain's "Manual of Composition and Rhetoric," by G. P. Quackenbos, a "Life of President Johnson, by a Southerner," and the "Annual Cyclopædia" for 1865.

SCIENTIFIC.

UTILIZATION OF THE SUN'S HEAT.—As bearing upon the question of the ultimate exhaustion of the coal fields, which was discussed in a recent number of THE NATION, and the possibility of substituting other sources of power for the fossil fuel which is now so important an element in the existing order of human society, it is of interest to recall a series of experiments made some years since by Sir John Herschel, at the Cape of Good Hope. Near the extremity of the cape, between Table Bay on the one side and False Bay upon the other, is a sandy region known as the Cape Flats, upon which the sun pours down its rays without hindrance. Herschel's attention having been attracted by the very high temperature which the surface soil of these flats acquires under exposure to sunshine, he proceeded to make careful thermometrical observations in the spring of 1837 (October and December), and determined that the temperature of the sand and vegetable mould was often as high as 140° to 150°, and this in the open field. "When, however, the heat communicated from the sun is confined and prevented from escape, and so forced to accumulate, very high temperatures are attained. Thus, in a small mahogany box, blackened inside, covered with window-glass fitted to the size, but without putty, and simply exposed perpendicularly to the sun's rays, an enclosed thermometer marked, on November 23, 1837, 149°; on November 24, 146°, 150°, 152°, etc., etc. When sand was heaped round the box, to cut off the contact of cold air, the temperature rose, on December 3, to 177°; and when the same box, with its enclosed thermometer, was established under an external frame of wood well sanded up at the sides, and protected by a sheet of window-glass (in addition to that of the box within), the temperatures attained on December 3 were, at 1.30 P.M., 207°; at 1.50 P.M., 217·5°; and at 2.44 P.M., 218°; and that with a steady breeze sweeping over the spot of exposure. Again, on December 5, under a similar form of exposure, temperatures were observed, at 0.19 P.M., of 224°; at 0.29 P.M., 230°; at 1.15 P.M., 239°; at 1.57 P.M., 248°; and at 2.57 P.M., 240.5°. As these temperatures far surpass that of boiling water, some amusing experiments were made by exposing eggs, fruit, meat, etc., in the same manner (December 21, 1837, *et seq.*), all of which, after a moderate length of exposure, were found perfectly cooked—the eggs being rendered hard and powdery to the centre; and on one occasion a very respectable stew of meat and vegetables was prepared, and eaten with no small relish by the entertained bystanders. I doubt not that by multiplying the enclosing vessels, constructing them of copper blackened inside, insulating them from contact with each other by charcoal supports, surrounding the exterior one with cotton, and burying it so surrounded in dry sand, a temperature approaching to ignition might readily be commanded without the use of lenses."

In the same connection should be remembered the suggestion, often made, that the sun's heat could be converted into mechanical force through the intervention of thermo-electricity. A thermo-electric battery, of proper construction, upon being placed in Herschel's box, for example, would surely be thrown into energetic action, and the power thus generated would be susceptible of direct application.

EFFECT OF SUNLIGHT ON WINDOW-GLASS.—It is a familiar observation that window-glass shows a tinge of color—purple, blue, green, or yellow—when looked at from outside against a white shade or shutter within. The very best qualities of glass, even the best French plate, although white when placed in the windows, often become colored after exposure to air and light for months or years. We find in a volume of the "Proceedings of the Boston Natural History Society," lately published, some observations by Mr. Thomas Gaffield, which add something to our knowledge of this obscure subject. Mr. Gaffield exposed some thirty specimens of plate, crown, and sheet glass, coming from various factories in England, France, Belgium, Germany, and the United States, to the full action of the sun during the month of July, in such a manner that the specimens were exposed to reflected light and heat as well as to that which fell directly upon them. The glass, which already had a decided green or blue tinge, though called colorless, was not affected; but all the white glass, and all the glass which was nearly white, whatever its precise hue, turned to a yellowish color. Very light-colored glass was, in some instances, perceptibly affected by even a single day's exposure. Mr. Gaffield exhibited ten pieces of French white plate-glass, one of which showed the original colorless glass, while the others demonstrated the change of hue towards yellow, after an exposure respectively of one, two, and four days; one, two, and three weeks; one, two, and three months. The changes in the first four days were slight; but the last specimens were so yellow as to exhibit a very marked contrast with the original glass. That the color permeates the body of the glass, and is not confined to the surface, or produced by reflection therefrom, was proved by grinding off about one-sixteenth of an inch from both surfaces and the four edges of one of the specimens, which, notwithstanding, after re-polishing still exhibited the same yellow color.

It is to be noticed that in these experiments only the light-colored glasses were perceptibly affected, but it is quite possible that a longer exposure, for years instead of months, would alter every color in some degree. Theories to account for these changes of color under the influence of the sun's rays are not lacking, but a large multiplication of experiments and a greater accumulation of similar facts are necessary before any satisfactory explanation of these curious phenomena can well be given.

NITRATE OF POTASH.—In the manufacture of saltpetre from the nitrate of soda of Peru, as effected with carbonate of potash in the usual way, several difficulties are encountered. It is by no means easy, for example, to get rid of the last traces of the carbonate of soda which is formed at the same time with the saltpetre, and which is apt to remain adhering to it. Hence the finished nitrate of potash which has been prepared in this way is rarely, if ever, perfectly pure. But by using caustic potash in place of the carbonate of potash, it is asserted that very satisfactory results can be obtained. For, since the soda, which is set free in this case, is very much more soluble in water than the saltpetre, the greater part of the latter can readily be separated by crystallization.

The details of the process, which is that of Dr. Graeger, are as follows: One part of carbonate of potash having been dissolved in twelve parts of water, the solution is boiled with the amount of lime necessary to convert it into caustic potash; the lye being then decanted, after repose, there is added to it an equivalent quantity of nitrate of soda (Chili saltpetre), and the whole is evaporated down to a strength of about 40° or 42° Baumé. On now cooling the liquor, the nitrate of potash will crystallize out.

WHITENING OF PAPER.—That some paper manufacturers are accustomed to increase the weight of their products by the introduction of pipe-clay, plaster of Paris, and other heavy colorless substances, is notorious, though the act is not usually spoken of in terms of commendation. But a technical chemist in Europe now proposes, without any reserve, to do away with the usual processes of bleaching with sulphurous acid or chlorine, and to whiten the paper simply by addition of white substances. He proposes, in short, to introduce by chemical means a quantity of sulphate of baryta (barytes) directly into the texture of the paper. This is effected by adding to the paper pulp solutions of alum and of chloride of barium, together with a quantity of slaked lime. By these means sulphate of baryta, together with a quantity of hydrate of alumina, is precipitated in and upon the fibres which, in the subsequent process of felting, are converted into paper. The sulphate of baryta, being of a brilliant white color, will, of course, tend to conceal the coloring matters of the original fibre. As the sulphate of baryta is very heavy, and as paper is sold by the pound, the method in question will, no doubt, have a fair trial.

EDUCATIONAL.

THE Legislature of the State of New York has just made provision for four new normal schools, and various towns and cities are getting ready to bid, as they would at an auction, for the privilege of receiving these projected institutions. There is something laughable in this contest of the towns, reminding us that seven cities of old were claimants for the honor of producing Homer. On the other hand, the readiness with which large places are willing to offer one or two hundred thousand dollars for the prize of a teacher's seminary is refreshing. It shows that the people believe in education. We wish that this popular interest in normal schools was shared by our thinking men, our scholars, and our statesmen; or rather, we wish that able men would take up and discuss with vigor the proper characteristics of a training school for teachers. Can the art of teaching be taught, like the art of music, or is teaching a gift? Will the scholars of a normal school learn best by observing good teachers, or by practising themselves on a class of children? If by the latter course, how will the children fare? Are teachers for all classes of children, the young and the advanced, to be trained in the same way, or is there an appropriate discipline for different grades of schools? Is teaching a knack, or is it a science? Have we not erred in this country by adopting too many of the features of the Prussian normal schools? These are only a few of the enquiries which must suggest themselves to all who study the workings of our existing seminaries for teachers.

—One of the best phases of modern philanthropy is seen in the case of destitute and neglected children—those who would become the outcast and dangerous classes of society if protection were not extended to them by the

law of the state and the law of Christian charity. Benevolent men in various parts of our country and abroad have been working on different plans and theories to promote the same end, the reformation of juvenile delinquents and the prevention of youthful crime. Twice in New York within a few years conventions have been held for the discussion of this subject in its manifold relations, and two pamphlets have been printed containing the result of these deliberations.

—A third convention will be held in Boston, on the 5th of June next, under the auspices of the national and local "Social Science Associations." The topics to be discussed are mainly those of the New York convention of 1859, namely: 1. The distinction between vagrancy and destitution, on the one hand, and crime on the other; 2. The comparative value of the family and congregate systems in reformatory institutions; 3. The work to be done by public as contrasted with private institutions, and the true principle of distributing these institutions in the community; 4. The true principles of legislation in respect of vagrant and criminal children; 5. The best system of education in reformatories—including manual, intellectual, moral, and religious education; 6. The best system of discipline, and how to train officers to administer such a system; 7. The length of time during which children should remain in reformatories, and the best method of providing for them when discharged.

—Our allusion to the number of educated young men who took part in the war has drawn out the following statement in respect to the graduates of the Wesleyan University at Middletown:

"The whole number of alumni and students that entered the United States military and naval service during the war was 134; of these, 68 were graduates. The number of alumni living is 724. The estimated number of those who are within the military age is 610. Of the classes that were connected with the college from 1860 to 1866, inclusive, about 30 per cent. joined the army. The four classes which graduated during the war, 1861–64, sent 33 per cent. of their number into the service. Ten died in battle or from wounds, and eight from sickness contracted in the army."

From Trinity College, in Hartford, we learn that not less than fifty of their former pupils served in the recent war. Though this number is not large in itself, it compares well with the number of laymen who have been trained in the college. It is estimated that forty per cent. of the entire number of graduates between eighteen and forty years of age, engaged in secular pursuits in the Northern States, entered the national army.

—The city of Cleveland, if we may judge from a recent pamphlet, is deep in the discussion of the "High School" question. At any rate, some objections made against this member of the system of the public schools have drawn from the superintendent in that city a very clear statement of the principles on which the high school should be maintained. He argues that the high school is of great benefit to the lower schools, by inciting the ambition and industry of all young scholars; that it gives respectability and attractiveness to the public school system; that without its facilities hundreds of young men and women would fail to receive such a training as they need for useful stations in life; and finally that the high school furnishes a large number of good teachers for the other city schools. He also shows how it happens that, from absolute poverty and the necessity of entering upon lucrative occupations, many who begin fail to complete the high school course. The document in which these views are brought out is the Twenty-ninth Annual Report on the Cleveland schools. It will be found useful in the many places where this topic is now under discussion.

DEAN STANLEY'S JEWISH CHURCH.*

To appreciate and criticise properly the great work whose title we have placed at the head of this article demands more space than we can give to it. All we can do, therefore, is to point out its place in literature, its good fruits, and its defects. It yet wants another volume for its completion—the history from the Captivity to the formation of the Christian Church; but it is even complete as it is, since it contains the chief sections of interest in the history of Israel.

As to its place in literature, this work stands alone in the English language. Dean Milman's work is but an outline of Jewish history compared to it; but then in the history of the Jews the author's object is different. He presents the whole history of that people down to the present time, while Dean Stanley, even when his work is entirely completed, will not go beyond the time of Christ. So that the works do not at all conflict, the one being so much more comprehensive in subject than the other, and therefore briefer in its analysis of the Jewish Church; and these are the only two works, outside Biblical criticism, of any authority on these subjects in the language. Nor is Dean Stanley's a full history. It is the history of the Jewish *Church*, not of the race, its language, or antiquities; it has an ecclesiastical tone and spirit, though it has even less of this than any other work we have ever read in this line of study. It is a history written freely; it has the spirit, fashion, style, air of any other great history, and though the treatment is in the form of lectures, they serve an important purpose in enabling the author to mass his materials at certain points with great effect. He has done for Jewish history what Mr. Grote has done for that of Greece. He has stripped off the unsecular bands which have withheld the facts of the sacred narrative from the common and free examination of scholars, and presented the facts of Divine dealing with mankind in their simple nakedness, with too much nakedness, too great a leaning to the uncertain results of recent criticism, we think, in his first volume—a freedom which is far less noticeable in the second. This gives you the point of view from which the author writes, and to a degree determines the place and value of the book. It has underrated the work in the eyes of some narrow theologians; it has exalted it in the view of others. We should judge that Dean Stanley himself (the notes at the close of the recent volume are in evidence) has come to more settled opinion since 1862. It is never safe in a great work to lean too much to contemporary criticism, though you may wisely follow its perfectly established methods; yet this is what to our great regret the dean very evidently did, through his great interest in the Essay-and-Review controversy, which has now gone to a blessed oblivion. The good results of that burst of new learning are manifest in this recent volume; the yeastiness is abundantly evident in the former; and yet, perhaps, not every one will discriminate between the two. Any one who has read carefully the dean's articles in the "Edinburgh Review" will be able to trace the changes which have come over his tone of thought. For ourselves, we believe one need fear nothing from the careful criticism whose true results Dean Stanley has embodied in his work; for there is a conservative element in Biblical criticism (and, indeed, in nearly every great department of thought) which tends always to correct its worst manifestations. We have mentioned this element here because it has much to do in the assigning of this history to its true place in literature. And its place is without doubt this: it is the only standard, popular, and authoritative history of the Jewish Church which we have or shall have for half a century. It is an attempt to apply the result of critioism to a popular statement and illustration of the Bible history. It is the attempt to do in prose for the Hebrew characters and life what the lamented Keble did in "The Christian Year" and "Lyra Innocentium;" and as the religious public pass through the change in the treatment and way of looking at sacred subjects which an intelligent observer can trace even in our current literature, can very broadly trace in the reception, warm and fervent, given to Keble and the writers in "Lyra Apostolica" (of whom Keble himself was one), we think Dean Stanley's labors will be even more highly estimated than they are now. He has successfully accomplished a great work, and one whose labor strikes you as much lighter than it really is; for the very familiarity of our minds with the subject-matter of his volumes makes us all the more exacting in our demands upon the author himself. To us, with all the helps which he has unquestionably obtained from others and in a sense made his own, there is a colossal labor implied in his compact and brilliantly learned pages.

An objection has been made to this work on the ground that it is not a philosophical history in the fashion of much which passes for history at the present day, that it is less a succession of speculations than a statement of facts. But this we have always considered a merit. The methods of arriving at truth are not given; the facts themselves are pointedly and brilliantly put. And then the narrative is filled in with much which is diligently gleaned from sources foreign to the Bible—Jewish and Moslem traditions—of course only authentic for purposes of illustration, but here invaluable. This makes the dean's pages living photographs. He is evidently an ardent admirer of Macaulay; but his brilliancy is not mere rhetoric; it is the result, just as with Macaulay, of a vast and ever-present wealth of learning, and, for ourselves, we would far rather read such a brilliant work than the languid pages of unimaginative historians, even if we cannot read long at a time. Now this brilliancy, this apt illustration from a mosaic of facts, is apt to lead one to undervalue the real depth of Dean Stanley's perception of the seminal truths of history; and yet we have always found in him a healthy philosophy, and his deductions are always clearly made. Looking through the twelve hundred pages of Jewish history which he has written, one can hardly find the great crisis or change, and the truth which was beneath it, not fully and adequately presented.

* "Lectures on the History of the Jewish Church. Part I. Abraham to Samuel. By Arthur Penrhyn Stanley, D.D., Dean of Westminster. Pp. xl., 572. Part II. Samuel to the Captivity. By the same. Pp. xxx., 656. Two volumes. 8vo." New York: Charles Scribner. 1866.

Part of his success is due to his first-class literary abilities. The men who do a real honor to literature, whose minds are deeply imbued with the literary spirit, are very few; and Dean Stanley is one of them. He shows this skill and excellence in the construction of his narrative, in the disposal of its light and shade, in his illustration of his subject from literature and life, in his frequent comprehensive connection of all great epochs in history, in the command of an apt and choice vocabulary, in the management of his very sentences, in the lighter and even the deeper imaginative coloring which gives to some of his descriptions the charm and power of poetry.

Then there is to be added the special fitness which comes from the peculiar turn which his studies have taken for many years. His "Sinai and Palestine" has long since become an authority in Biblical study, and his two visits among the very scenes of sacred story have prepared him to present with almost the fidelity of an eye-witness the great events which he describes. And some portions of his work, as the battles of Joshua and the Judges, the career of Elijah, the rise of the Hebrew Monarchy and its splendid culmination in the reign of Solomon, are among the finest specimens of vivid, clear, brilliant narrative that we have ever seen. Whoever has read the chapter on Samuel can never forget its pathos and tender beauty, and whenever the author comes to the great humanities of his history the tone of the narrative blends in indescribable sympathy with the event itself, and some of these scenes are so brilliantly painted that to the mind's eye they will ever seem living realities and moving forms. Is not this the true method of writing history? The author ever remembers that he is not only a priest but a man, and that the characters whom he paints were once clothed with flesh and blood. And besides, there are some chapters which are priceless in their popular value. These are, "The History of the Prophetical Order," "The Nature of the Prophetic Teaching," and "The Jewish Priesthood," to which may be added "The Psalter of David" and "The Wisdom of Solomon." We know not where else to find in the language what these contain, and every student in divinity as well as every general reader knows how wrapped in mystery these subjects have long been from the want of clear teaching. Here Dean Stanley has supplied a great need. He has not written entirely as a theologian, but he has supplied what even theologians do not always teach. There are, of course, many who will go to the original sources for their information on such topics; but there are no sequestered bands of priests in this country to cherish these studies, and the hard-working parish clergyman is only too grateful for such popular exhibitions of important topics, since if he has any learning on many subjects it must be entirely derived at second hand.

We think the completion of this work so far an ominous sign. The day is passing by when commentaries are to be so generally trusted as they have been. The "Dictionary of the Bible" contains the digested knowledge for a hundred commentaries, and no work is more frequently quoted in the Jewish Church; and the dean's work itself is to a large extent to be the substitute for commentaries. It is a continual illustration of the Bible. Its brilliancy does not lead one away from the Scriptures; but it presents such a fresh and living synopsis of their great points that the reader goes to them with greater interest than ever before, and just in this particular are such works as the present to supersede commentaries. There will always be a learned criticism answering most useful ends; but for the mass of intelligent readers such books as the "Jewish Church" are to be the chief introductory works to the Bible. One cannot but regret, therefore, in this change of study (and "Ecce Homo" is a witness of this change, so far as the New Testament goes) that Dean Stanley sometimes assumes an entirely negative position, so far as the theological bearings of his subject go. It is doubtful whether he was wise in leaving out so entirely what was theological. It has always seemed to us, though here we are chiefly concerned with the literary merits of this work, that in the Jewish history theology and history go together; and if we are right, the dean's silence, which is sometimes painful in the first volume, is the great defect of his work. If this work is to be used, as it probably will be, instead of a commentary (for we have none on the Old Testament in English that are of much value), this defect will be such as to interfere largely with the usefulness of one of the great works of the day. The author seems to have ignored this part of his subject through a fear of that excessive typicalism which is the other extreme, and yet he has made many honest amends for it in his second volume, though he has not said all which Christian scholars will demand. This is of a piece with the unfortunate prejudice under which the whole work was written. Dean Stanley is probably learning, if we may so interpret his most recent course, that there is a catholicity, though we admire exceedingly his noble liberality of thought and his frank assertion of it, which loses sight of the truth.

We should like very much to enter more fully into the criticism of the "Jewish Church," since it both provokes it and will bear it; but there are numberless others who will do that effectually enough. Whoever will give it close study and use carefully the foot-notes, will bring very much to the elucidation of the Scriptures; and we are entirely safe in saying that no such portrayal of Jewish life and character can elsewhere be found. The literature of the subject has been exhausted. It is to be regretted that many of the references in the notes have not been adapted to the American editions of the books referred to, as the "Lectures on the Science of Language" and "Milman's History of the Jews," and some other works. It is a blunder which publishers ought not to make, and we do not know of a reprint of any good book in which it has not been made again and again. But the publisher deserves great credit for the superior style in which the work is presented to the public, and the ample apparatus, excepting this neglect in references, which makes the work useful and handy. The day has gone by when good readers wish good books in bad type and paper and binding in this country.

ALEA JACTA EST!

THE state of Europe throws my mind into the greatest perplexity. We are on the eve of a terrible crisis, similar to the Thirty Years' War or to the great Revolutionary war—of one of those convulsions the issue of which nobody can foresee. It seems as if all the nations of Europe were on the point of being thrown into a furnace, and nobody can predict what alloy will be found when the melted metals are left to cool. Millions of men are already under arms, and in a few days will probably confront each other on the battle-field. The pretext is a miserable dispute about the miserable duchies of Schleswig-Holstein. The real cause, which is visible enough to a good observer, is the singular alliance which has been formed between good and evil passions, between egotistical and national aspirations. Italy wishes to tear Venetia from the hands of Austria; Bismark, to assure the triumph of his ambition and of Prussian hegemony; the French Emperor, to silence the liberal opposition and to consolidate by new victories his tottering dynasty. From these various and almost contradictory motives these three powers have entered into a conspiracy against the peace of Europe. Bismark has spoken first, Italy has armed after him, and now Napoleon III. has thrown off the mask at Auxerre in one of his fatidic speeches. Turning his back upon Paris and on his own parliament, which a few days before had unanimously cheered a pacific speech pronounced by M. Thiers, Napoleon III. shows himself to the peasants, tells them that among them only he can breathe freely, and that with them he expects to destroy the remnants of the treaties of 1815. But who, before history and before the French people, must bear the responsibility of these treaties but his illustrious ancestor? And besides, how can a Prusso-French alliance be reconciled with an attack upon these treaties? This remains to be seen.

Three points in these famous treaties, which every Frenchman detests, were exclusively directed against France; a bastion was placed on the north, if I may say so, which was the kingdom of the Netherlands; a bastion on the south, the kingdom of Sardinia, under the guard of Austria; and between them a long line of attack was extended from Cologne to Sarrebrück. The liberal revolution of 1830 cut in two the kingdom of the Netherlands, and placed between us and the remains of it the neutral and friendly kingdom of Belgium; the Italian war has freed our frontier of the Alps; there remains then only this point of the Prussian sword which enters into our very heart. Does the Emperor hope that Bismark will voluntarily withdraw it, and that, satisfied with seeing an administrative and military despotism established all over Europe, the Prussian army and bureaucracy will gladly fall back on the right bank of the Rhine? I have my doubts on this point. Will the French Emperor be satisfied with Landau, Sarrelouis, and what is called the frontier of 1814? It would be a very trifling price for the blood which must soon be shed, and the most threatening and dangerous part of the treaties of 1815 would still be maintained, and would even be aggravated by the increase of the Prussian power. Has the Emperor no settled design? and does he only hope to profit by circumstances? We shall see.

The war is, I hear, very unpopular in Germany, and I do n't much wonder; for, in point of territory, the Germans have nothing to gain, and unity in the shape of military and bureaucratic despotism cannot be very acceptable to the German patriots. Italy may gain Venetia by this war, and I would rejoice if she did; but I cannot help thinking that this conquest will come too early or too late: too late, for if it had been made in 1859, according to the first promises of Napoleon III., Italy would have escaped many

difficulties and not have found herself nearly bankrupt; too early, for in the interest of her own independence it would be better for her if she could seize Venetia without the help of two despotic powers, or obtain it from Austria by pacific means, which sooner or later must have happened.

Nobody can have more sympathy than I have for the German people; in my work on the United States I have tried to do full justice to the conduct of the Germans during your last war, and to the growing importance of the German element in the fabric of American civilization. I have lived long and travelled much in Germany; I admire the courage, the genius, the character of the German people; I am not of those who would wish to see Germany always divided and weak. I also have sometimes remodelled in my dreams the map of Europe, and seen a new Germany, united, happy, and prosperous, under such a constitution as suits her genius, but not under one or two military despotisms. I can understand that the transformation of the German Federation is worth many sacrifices. But I cannot understand why the Germans should rush into what I can only call a civil war not to defend a vital principle, not to establish their political independence, but merely in order that the whole of Europe should be divided into a few strong military governments, always in arms and ready to throw themselves on each other. Is this the ideal for which millions of men are preparing now to die?

A. Laugel.

May 11, 1866.

PARIS GOSSIP.

Paris, May 11, 1866.

The magnificent summer weather of ten days ago has been succeeded by a most unwelcome return of winter; everything hilly in France is covered with snow, and from the north of England and Scotland come lamentable accounts of young lambs killed on the wolds by sudden frosts, communication impeded by heavy snow-storms, and all hope of pears, apples, and plums cut off for this season. In Scotland, especially, the weather is so cold that even the famous Bushman, brought home by the late world-renowned lion-hunter, Richard Gordon Cumming, to his native Inverness, would probably not object so strenuously as usual to the European clothes his master used to take so much pains to teach him to wear. The great hunter was a scion of an old family of wealth and standing, his father being a baronet, and the family seat, near Inverness, one of the finest of that part of the country. On his last return from South Africa, he brought with him a Bushman whom he had caught in one of his trips, a frightfully ugly little creature, to whom he had taken a great fancy, and whom he tried hard to draw out of his natural state of more than monkey-like obtuseness. The Bushman, on his side, adored his master to the fullest extent of his very limited faculties; followed him about with the fidelity of a dog, and did everything he bade him do, even to wearing the smart costume which Mr. Cumming had had made for him, though always manifesting his dislike for these troublesome appendages by uttering a series of plaintive, semi-articulate howls whenever he put them on. Though docile to his master, it was known that the little yellow savage, with his small eyes and lank hair, had sharp teeth and could bite like a mastiff; and he was, therefore, an object of no little terror to all the household, including Lady Cumming herself, though the poor Bushman showed almost as much fondness for her as for her son. On one occasion the latter, having left home for the day, after superintending, as usual, the toilette of his *protégé*, the little Bushman, comprehending, apparently, that he would be his own master for several hours, went up to his room, took off every bit of the obnoxious apparel, hung a small mat upon his back, and, thus lightly and airily attired, made his appearance in the drawing-room, where he at once sat down at Lady Cumming's feet, a position from which no amount of persuasion could dislodge him. No one dared to use force with the little savage, and all Lady Cumming's visitors had thus the unexpected opportunity of learning the nature and extent of a Bushman's views on the subject of clothing.

This being the great month for the administration of the rite of confirmation, the streets have been filled with young girls in dresses, caps, and veils of book-muslin, and boys with shoulder-knots of white satin ribbon, on their way to and from the various churches. At certain hours the interior of these buildings has presented a very pretty appearance, the aisles being completely filled by these children—the girls on one side, the boys on the other—all singing the psalms appropriate to the solemnity. The matter-of-fact light in which the ceremonies of their Church are regarded by Catholic populations is fully evident in their manner of referring, in after life, to the period of their individual ecclesiastical experiences. They constantly say, "About the time when I was to take my first communion," or "Soon after I took my first communion," to designate the epoch at which something or other occurred in their secular life. The children are all duly catechised, shriven, and exhorted, before being admitted to the rite; but comparatively few seem to see anything more important in the matter than the display of their little persons in the eyes of the congregation, decked out in the pretty book-muslin dresses and the white shoulder-knots.

The congregation of the French Protestant church here, presided over by M. Martin-Paschoud, has been "in hot water" for some time past, the reverend gentleman preaching doctrines which, though regarded as satisfactory by the great majority of the members of that body, are considered as heterodox by a small but very energetic minority, at whose head is the ex-prime minister M. Guizot. As there is no regular "profession of faith" in the French Protestant Church, there is no legal standard of orthodoxy; and accordingly the two parties alike appeal to the Minister of Public Worship, one party demanding that M. Martin-Paschoud shall be dismissed from his post, the other protesting against this demand and declaring their wish to retain him. The affair has been contested two or three times before the proper tribunals, the verdict going sometimes one way, sometimes the other; and a very strong memorial in favor of the incumbent, and signed by above six hundred members, having recently been sent in to the minister, that somewhat bitter partisan, M. Guizot, has solicited and obtained an audience of the Emperor for the express purpose of setting forth the views of the dissidents and enlisting the sympathy of his Majesty against the aged incumbent whom they wish to oust from his post, a proceeding which has roused the indignation of the majority to a very high pitch. Things having arrived at this amiable point, M. Martin-Paschoud took, last Sunday, for his text the twenty-fourth chapter of the Acts of the Apostles, from the first to the end of the sixteenth verse. The passage thus brought before the congregation, relating how "a certain orator named Tertullus informed the governor against Paul," and how, though hating the alien functionary, as did the rest of the Jews, the great orator yet stooped to flatter Felix, in order to influence him against Paul as "a pestilent fellow, a mover of sedition and the ringleader of a sect," is so marvellously applicable in all the details of its narrative to the facts of the pending quarrel—for M. Guizot detests the Emperor quite as heartily as the Jews detested the Roman—and the justification of himself made by Paul in the concluding verses resumes so exactly that which M. Martin-Paschoud has made in his own behalf, that the reading of his text created no little excitement throughout the audience. The majority were in raptures and looked as though they would gladly have indulged in a round of applause at each "palpable hit" of the narrative; while the dissidents, furious at an applicability whose existence they would be so unwilling to admit, did their utmost, by trying to look innocent and unconcerned, to avoid any appearance of recognizing the picture of their own tactics reflected with such curious fidelity in the ancient mirror held up to their view. How far this very clever "turning of the tables" upon his adversaries may tend to appease the dissensions of the congregation in question is, of course, another affair.

The threatening aspect of the political world is naturally pre-occupying the public mind to the exclusion of most other topics; and the general reprobation of the crooked policy that has brought us to the verge of a new war has found vent in the coining of a new verb, now in great vogue in all the card-playing and billiard saloons of the capital, in which, when a player is found out in cheating at play, he is at once accused of "Bismarking," and turned out accordingly. But the imminence of a war that threatens to convulse all Europe does not cause the Emperor to slacken in his energetic preparations for the great show of next year. The Commissioner-General goes to the Tuileries every day, and lays a minute account of the works and the measures adopted before his Majesty. The Emperor has just decided to add an exhibition of flowers and fruit to the other "attractions," and will contribute largely towards the expenses of the exhibitors. He has also determined to add the sum of 200,000 francs to the amount to be adjudged in the form of prizes: one prize of 100,000 francs to be given to the workshop or factory in which the solidarity of interests between capital and labor, master and workman, shall be most completely realized, and ten other prizes of 10,000 francs each, all to be awarded without distinction of nationality. In order that those who obtain the various awards, so generously provided, may profit by the distinctions thus conferred upon them during the remainder of the duration of the Exhibition, the distribution of rewards is to take place on the 1st of July, 1867, on which occasion a fête is to be given whose magnificence may be inferred from the fact that a sum of 800,000 francs has been set apart for this item! Rooms will be prepared in the old Palace of Industry for the various foreign commissions until the opening of the new palace in the Champ de Mars, after which those rooms will be closed, and the various commissions will be installed in the new structure, where a "Universal Club" is to be established for the convenience of all, exhibitors and visitors, who may be disposed to join it.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

FIDELITY TO PARTY.

No one can be more averse to the common subserviency of Americans to party leaders and party spirit than we are. It is to us a melancholy spectacle to see intelligent and honorable men wink at corruption merely because it seems to benefit their party, or sustain measures which they know to be disastrous to their country simply because their party has adopted them. It is to be desired that the American people may grow more and more independent of party, looking not to names and standards, but to principles and the fitness of men to carry them out.

But, on the other hand, it must be borne in mind that parties are essential instruments in the conduct of public affairs, and that useful instruments must be treated with consideration. An engineer would be mad who should prefer the safety of his engine to that of his passengers. But no engineer could secure the safety of passengers without paying close attention to the working of his engine, nor without conforming his action to the nature and necessities of his machinery. Party organizations are the machines by means of which great public ends are to be achieved. And while the end should never be sacrificed to the means, yet a man who, in his haste to attain his end, destroys the machinery properly used for that purpose, is most likely to fail of success even in the particular effort to which he devotes himself, and is certain to destroy his power for further usefulness.

Men are generally raised to public positions by the aid of organized parties. They are elected by the votes of men having certain definite opinions, in the expectation that they will carry out those opinions. If, upon attaining power, it should become common for officials to change their minds and to affiliate with the party which opposed their election, it is plain that all political confidence will be destroyed, and that an election will degenerate into a mere lottery. No one could tell for what policy he was voting, since the utmost labor spent on behalf of a candidate advocating one set of principles before election might prove to have been used practically for the support of principles directly adverse. Conversions in office, even to a better cause, are, therefore, an evil of such magnitude as to be intolerable under a democratic form of government. Whatever good may be done by such converts in special cases is more than counterbalanced by the unsettling of public confidence in the good faith and honor of aspirants to office.

But it may be asked whether a man in public life is bound to shut his ears to reason and his eyes to facts. By no means. Nor is a change of views on many points discreditable to a public man. A village politician, when first chosen to Congress, comes into contact with many men and many things whose existence he had never before taken into account. Many supposed facts upon which his political theories were based vanish in the light of superior knowledge. He ought to be open to conviction. He ought to modify old prejudices faster even than if he were in private life. But he ought not to misrepresent his constituents. He ought not to betray his trust. He has no moral right, when power has been conferred upon him in the faith that it would be used in a particular manner, to use it in an opposite direction. The course proper for an honorable man in such a case is clear: he should resign and seek to persuade his constituents to join him in his change of opinion.

Thus it might be a commendable thing for a Roman Catholic archbishop to become a Protestant, but we trust that very few Protestants would thank him for turning out the priests from all the Catholic churches in his diocese and transforming them into Protestant churches, by virtue of his power as sole trustee. So Bishop Colenso's renunciation of the Pentateuch may be creditable to his candor; but it cannot be denied that his renunciation of the bishopric, which he never could have had if his views had been known before his consecration, would have been more creditable to his sense of honor. We should be glad to see the member from "old Berks" converted to the doctrine of universal suffrage, but should be sorry to have him mar his conversion by retaining his seat after it without the consent of his district.

This is a doctrine essentially different from the well known, but very doubtful, theory of the binding force of instructions. It is one thing to hold, as do the advocates of the latter doctrine, that the legislator must follow all the caprices and changes of his constituents, and quite another to hold him bound to adhere to the policy by pledging himself to which he secured his election. The difference is that which divides democracy, in its broadest sense, from republicanism; but even republicanism cannot exist without a general adherence to the principle we have here advocated.

In 1846 the influence of Sir Robert Peel and the arguments of Mr. Cobden induced a large number of members of the British Parliament, who had been elected as protectionists, to support the repeal of protective duties on corn. Wherever their constituents manifested dissatisfaction, these members resigned and submitted themselves to a fresh vote. This was manly and honorable. So, within a few weeks past, M. de Bussierre, of Strasburg (department of Bas-Rhin), having been elected with an understanding that he would unite in requesting an extension of liberty from the Government, and deeming it impolitic to do so, resigned his seat, and was re-elected. Whatever may be suspected or said of the means used to secure this result, it is at least certain that the resignation of M. de Bussierre was a creditable action. Politicians in America should be taught to follow such examples.

The common excuse for betraying the confidence of electors is, that the particular measure or the particular policy for opposing which complaint is made was not broached at the election, and that the representative is therefore free to decide upon it at his own discretion. Where the question is absolutely new, this may generally be claimed with justice. Thus, for example, a member of Congress elected in 1856 could not have been pledged to any precise course with regard to the admission of Kansas under the Lecompton constitution, which was framed in 1857. But members *were* generally pledged to some general policy in reference to Kansas, which either justified or condemned that constitution. So members elected in 1860 were not pledged to any course in regard to war, which was not then anticipated by the North. This, however, would have been a poor excuse for any Republican who should have voted against the necessary appropriation bills.

The implied pledge under which, as it seems to us, every legislator is elected, is that he will carry out the general aims of his party in respect to matters upon which its policy is not fully developed, and that he will co-operate with that party in shaping a policy in respect to new questions, not dictating to it, but advising with it.

Applying these principles to the present state of affairs, we think it perfectly clear, *first*, that the great and victorious Republican-Union party of 1864 did not then adopt any fixed scheme of reconstruction for the sufficient reason that it had not then the power to reconstruct; and *second*, that the party fully contemplated the work of reconstruction as one that would eventually fall to its lot to accomplish, and one upon the mode of which it would agree when the proper time came. No one would have been nominated by that party who had expressed a determination to carry on this work upon a plan of his own, regardless of the wishes or advice of the party. Mr. Lincoln was the very embodiment of the idea that no plan should be fixed upon until the time came for its execution; and it was one of his favorite sayings, that the party which had been able to agree upon the means of carrying on the war would be able to agree upon the means of terminating it.

With this understanding all who now hold power through the votes of the Union party were elected. It is, therefore, a breach of faith for any of them to attempt to force through schemes to which the bulk of that party are opposed. Conceding that the party entertains wrong views upon the subject, yet the evil of an erroneous policy is not so great as the evil of a line of conduct which breaks down all confidence between men in political life, which makes representation a mockery and the ballot a snare.

We cannot, therefore, join in commending those high officials who make a virtue of having sunk party ties in assuming posts of public duty. They might as well boast of having sacrificed their honor, abandoned truth, and destroyed conscience in the service of their country. The best service is too dear at such a price. Undoubtedly there are

occasions in which a statesman may render an important service to his country by violating his conscience. But the service is temporary, and the precedent one of far-reaching injury. Statesmen are selected by a free people to serve them by honorable means. And those who, in their impatience, are not content to serve the people in the way that the people have chosen, had far better seek a land of despotism where some modern Cæsar imposes benefits upon his subjects against their will.

SPENDTHRIFTS AND PRICES.

We ascribed, in a recent number of The Nation, the general and rapid rise in prices which has taken place during the last twenty years to the extraordinary additions made by California, Australia, and other gold-bearing regions to the quantity of the precious metals in circulation. That this has been the main cause of the greatly increased cost of living which is now observable in every civilized country there can be no sort of question. But there has been another agency at work of which political economists have taken no notice, but which we think may be safely said to have borne a large part in raising the prices we will not say of all commodities—nothing but an increase in the volume of the circulating medium can do this—but of a number of commodities on which the inhabitants of towns at least are largely dependent for their comfort. We mean the reckless and lavish habits of the immense body of persons whom the industrial and commercial activity of the last thirty years has made, if not suddenly, rapidly rich. This class is perhaps larger in the United States than in any other country, but it is also very large in England and in France, and is becoming very large in Germany.

To explain in what way its existence affects prices, we must remember that down to the beginning of this century the old aristocracy—that is, persons with fixed or declining incomes which they had inherited from their fathers—were almost the only rich men in every community. But what with entails and provisions for daughters and younger sons, and charges of all kinds, inseparable from what is called "position," the aristocracy in all countries has long been a needy class. The plate and diamonds and other fine things owned by the proudest houses in Europe have, in nine cases out of ten, been handed down by some extravagant progenitor of the seventeenth or eighteenth century. Except in the few cases where estates have risen greatly in value, owing to the discovery of mines on them or the growth of cities in their neighborhood, there have really, for a century or more, been very few aristocrats in the world in a position to indulge in lavish expenditure. They have generally been obliged to regulate their expenses very strictly, to confine each item very rigidly within certain limits—to live in fact by rule, and often to deny themselves everything not absolutely essential to the maintenance of their "social position." Any aristocracy which refused to do so, such as the Irish and Prussian, has disappeared, or been reduced to poverty and insignificance. Out of this necessity there grew up, of course, habits of carefulness, of prudence, and a strong dislike of display. We are satisfied that the quietness which aristocracies now affect in dress, equipages, and furniture, though largely due to the growth of good taste, may be partly ascribed to the increasing strain on incomes. It must not be forgotten, too, that men accustomed to the possession of wealth from their youth up, are generally much more measured in their enjoyment of it, and spend it much more skilfully, than those who fall into it after their character and habits have been formed. If, therefore, the old feudal aristocracies had continued to be the only rich class, although prices would undoubtedly have risen as the quantity of gold increased, the disturbance in them would have been much less violent than it has been and is.

The feudal aristocracy has not remained the only rich class. It is, in fact, now comparatively poor. There has grown up beside it a commercial class whose aggregate wealth is enormous, and in which fortunes of which dukes only dream are becoming quite common, and which, not being burdened with the obligation, real or supposed, of handing a family "down the ages" in splendor, is now enjoying its money with all its might. There is to be found in it a very large amount of taste and culture, and, consequently, it has given a wonderful stimulus to art and literature. There is to be found in it, too, a very large amount of Christian zeal and of Christian charity, and it is, consequently, founding benevolent institutions and setting on foot enterprises for the instruction or elevation of the human race on a scale and with a munificence before unheard of. The public spirit of great merchants is, of course, nothing new, and is not peculiar to our time; but in our time there are one thousand great merchants for the one that any preceding age could boast.

But there is also in this class, in every country, a large body of persons to whom money is simply or mainly a means of personal enjoyment, and having had no experience in spending it, and having inherited no principles or rules of spending it, and being bound by no traditions about it, they rush into the markets of the world in the wildest indifference as to the value of things. What they want they buy, cost what it may, and they take a certain pride in paying lavishly for it. Nothing can be learnt from their dealings as to the value of things, because they take no pains whatever, either by chaffering or holding off, to bring sellers down to the real price. To servants they give any wages they choose to ask, and pay for everything that ministers directly to personal enjoyment—carriages, horses, clothes, houses, furniture, jewelry, food—the highest price that dealers venture to put on them. The waste wrought by this class is frightful, in sinking large sums in things essentially worthless and generally ugly; and the influence of their example on servants, on the young, and on the poor is, of course, very pernicious.

It is not with their moral influence, however, that we concern ourselves here, but their economical influence; and this, we think, is very marked. They of course all live in great cities, and the markets of great cities, owing to the railroads, now fix the prices almost over the entire country. One hundred miles from New York, or Paris, or London one can hardly get anything for less than it will bring in the city, and what it will bring in the city is what the tribe of people engaged in the enjoyment of newly-acquired fortunes are willing to pay for it. The wages of servants, for instance, is really now determined by this to a degree of which most people are not aware. There are very few great cities where servants are receiving the political economist's market price. What they get is not what their labor is worth in the existing state of the demand and supply, but what John, or Thomas, or Bridget had the impudence to ask Mr. Corner, of the Stock Exchange, or Mr. Putemthrough, of the Great Gammon and Spinach Company, and which he at once gave, partly through indifference about money and partly through pride in spending it lavishly. The same thing may be said of horses and of plate and jewelry, of houses, of hotel and restaurant prices, and even of land in desirable situations. In fact, we are witnessing, on a larger scale and clothed with somewhat greater refinement, the class of phenomena so common at "the diggings," where miners who happen to be "flush" pay a small fortune for a drink or a game of billiards.

The disturbance which this lavishness is causing in the social arrangements of the great cities is such that in nearly all of them the middle classes are being driven out or forced into a plainer style of living. And we do not see much prospect of any change for the better until the resources of all the new countries are much more nearly exhausted than they are now, a period still very remote, as it may be said that it is only since the invention of steam locomotion that those of this continent and of Australia have begun to be worked. Africa and South America, both regions of incalculable wealth, are still untouched. What the effect on modern society of the application of Northern capital and energy to them will be, it is impossible to conjecture. But we may safely look, for a century to come, for a constant upheaval to the surface of the lower strata of society, and for the possession of large fortunes by persons untrained in the use of them. The spread of education and of taste will doubtless gradually do much to correct the evils which at present flow from this state of things, and it may be that we are just now at the lowest point. But there can be no question that the manners of a portion of the "new men" of our time do constitute an economical agency of some importance.

PROTECTION TO NATURALIZED CITIZENS.

A QUESTION of international policy is now pending between the United States on the one part and most of the European powers on the other, which has not received from our Government the attention that it merits. It is the long vexed question of the status of naturalized citizens of the United States, or of the amount and kind of protection that they ought to enjoy in case they return temporarily to the place of their birth. It has even been made doubtful, by many occurrences, whether these citizens were recognized as entitled to any effectual protection whatever, when embarrassed or arrested by the Government to which they formerly owed allegiance. It is a cherished maxim of the English law that "once a subject, always a subject," and the codes of the Continent, if less emphatically announcing this doctrine, no less strenuously maintain it in practice; and it is the entire absence of any similar one in America that occasions the difficulty alluded to.

The circumstances are these: In Prussia, for instance, there is a law which holds every able-bodied youth, from the son of the king down to the son of the humblest peasant that hoes his cabbages on the banks of the Spree, from seventeen upwards, subject to be drawn in the military lottery for service in the army. After a term of actual service in the ranks or elsewhere, these conscripts are transferred to the rolls of the Landwehr, or reserve militia, but are still liable to be called upon in an emergency to take the field, and, in fact, in the present war excitement have been put for a time under drill. It is easy to see that this includes the great body of the young men of the country—the class that is most anxious to emigrate, and whose presence in the United States is most desirable. Every emigrant under the age of seventeen, though not yet fully a citizen of Prussia, is held to be such when he attains the proper age, in whatever foreign land he may have taken up his residence; and for a soldier who still has service to perform in the army or in the Landwehr to emigrate to America is, of course, nothing less than desertion. What do we see, then? When the emigrant, who has been years away from his parents and friends, after accumulating wealth in the New World, returns to spend a few months among them, he is liable to be arrested and held to service for the remainder of the term which he left incomplete. More than that, there often awaits him a judgment for the accumulated commutation of years, sometimes even to the amount of one hundred dollars, and it is only by discharging this debt that the citizen is free to return to America. That this evil is one of serious proportions is shown by the fact that between the years 1857 and 1861 over two hundred naturalized citizens of the United States were in the Prussian army against their will. There are at present not less than half a dozen who are known to be in the same condition. Others have been released through the efforts of our indefatigable minister, Mr. Wright, but only by the courtesy of the Prussian Government, which acknowledges no obligation to grant the release prayed for.

What has rendered this forced detention of American citizens in some instances more discreditable to our Government, is the fact that some of the victims had performed faithful service in the Union army throughout the war. After three or four years of arduous campaigning, in which they had almost altogether lost sight of their European relatives, through the irregularities of mails, they had returned to Prussia with their savings so honorably earned, for the purpose of taking back with them their parents, and, on arrival, were arrested as deserters. One poor fellow, who had won a cross in the Army of the Cumberland, in his simplicity supposed that in the Old World it would entitle him to high distinction, wore it in the streets of Berlin and among the wondering friends of his youth at his native place, was arrested as a deserter, and only succeeded in getting off after an outlay of over $150. We have heard of an intelligent and wealthy German from Chicago, who went out to the same country in the hope of being able to visit his parents, who reside a few miles from the capital, undisturbed. He was obliged to drive to their residence at eight o'clock in the evening and return the next morning at daylight, and did not venture to repeat the act on learning that the officers were informed of his presence and were actively on the lookout. American-Germans feel this humiliation painfully; our minister feels it; native Americans, when informed of the fact, feel it likewise.

This state of affairs has not grown out of, nor is it a necessary indication of, weakness in our Government, but is the result partly of indifference and partly of sheer remoteness. When an Englishman is arrested on the Continent or seriously impeded in his movements, a burly protest arrives at once from London, and the affair is not dropped until that citizen is released; the Atlantic does not intervene, and, besides, there are few cities on the Continent that do not retain a recollection of the presence at some time or other of the red-coats; but no one ever saw an American soldier, and the thunder of our columbiads grows faint before it travels 3,500 miles. It is undeniable, however, that not all has been done that might have been done to secure protection abroad to naturalized American citizens. As far as those are concerned who have left their country while actually in its army, we cannot undertake to intervene, since they are deserters and must abide their chances; but in relation to all others there should be a treaty which will afford them immunity against arrest. The details of such a treaty are now under advisement between Mr. Wright and Count Bismark, and there is a strong probability that it will be perfected and established. Several months ago Mr. Wright wrote to Mr. Seward for authority to arrange such a treaty, and received a reply to the effect that the rights of American citizens ought to be already sufficiently secured by international law, and that a treaty would be superfluous. Upon a full presentation of the facts, however, Mr. Wright received all necessary authority, and has already made good progress in hisnegotiations. Count Bismark first proposed that all who left Prussia before the age of seventeen, and all above that age who had been in the United States ten years, should be exempt from molestation on returning here. This was about three months ago, but it was not accepted by Mr. Wright. Within a few weeks the premier has made a second offer proposing to exempt all who have been seven years in America. With that the affair rests for the present.

It cannot be doubted that such a treaty, or any treaty that would make the American passport as potent for a naturalized as for a native citizen, which it now is not, would greatly stimulate emigration to this country. It is the sanguine letters from America and the wonderful stories they contain that keep the farmers of Germany in a ferment and crowd the decks of the emigrant ships. But above all does the presence of returned friends, who become the centres of wondering groups, promote this result, and vastly more of them would return if they were assured that they could do so with perfect safety. The influence of their simple eloquence is far more effectual than that of all commissioners of emigration and printed circulars combined. Before the evidence of a returned brother or son who can afford to wear a gold watch and drink several pints of beer every day in the week, instead of only half-a-pint on Sunday afternoon, all incredulity vanishes at once. Then, again, many young persons are deterred from leaving for America by the knowledge that if, at some future day, they shall return to take their parents with them, it will be at the hazard of much inconvenience and, possibly, of months of unwilling service in the army. In short, every consideration, as well of interest as of justice and national honor, urges our Government to the speedy arrangement of a proper treaty, not only with Prussia, but also with all those nations that supply us with emigrants and still claim their allegiance.

"OLD LAMPS FOR NEW."

OH soul! wert thou a poor maid-servant, weak
And foolish, and unknowing how the walls
Of shining stones, and silver, and fine gold,
Which made our dwelling glorious, our life
Assured, were built, that thou must spring at call
Of our most deadly foe, lured by the sound
And glitter of his hollow brass, and give
Into his treacherous hands our all!
And now,
For thee and me remaineth nothing more
But cold and hunger and the desert!
Soul,
Rise up and follow him, and tarry not,
Nor dare to call thy life thine own, until
Thou hast waylaid and slain him sitting at his feast,
And laid our talisman once more upon my breast!

THE APOSTLE BLOT.

LET us rejoice. A new dispensation is vouchsafed unto us. An apostle has come over unto our Macedonia to help us, and his name is Blot. He preaches the long-neglected Gospel of the Body, and the people receive him gladly. He counts among his disciples multitudes of honorable women, and of men not a few. He is not persecuted from city to city—contrariwise, he is entreated to visit them and impart unto them his doctrine. The only fires that are kindled for him are those which he teaches how to be the most friendly servants to man. Instead of having stones showered upon his head, his pockets are filled with rocks. And yet his beneficent mission is a reproach unto us, for it argues that we are wanting in one of the chief elements of civilization. He comes to deliver us from the bondage of barbarism and to teach us a more excellent way. He comes to prove to us that when God has sent us good meat in such abundance there is no need of getting our cooks from the devil. We rejoice to know that his ministrations were waited upon by the very flower of upper-tendom and Fifth Avenuity. It is a sign of grace for which we thank God and take courage. It is an augury of a much-needed and long-waited-for reform which we trust may soon be accomplished, and good cooking be the rule of our lives instead of the exception. This philanthropist is now fulfilling his errand of mercy in Boston, the solid women (we speak only of their financial, and not of their personal, weight) of which city throng in crowds to learn of him. We hope that he will continue to extend his beneficent labors, and establish a culinary church universal which shall be known of all men for its good work.

We may seem to speak lightly, but we are terribly in earnest. This matter of cookery reaches farther than the body to which it seems at first to belong. It is closely connected with the temper of the mind as well as the health of the body. The kitchen is the laboratory in which the materials are chemically prepared out of which we are renewing ourselves daily in the texture of our bodies, and whereby, if physiologists do not lie, we make ourselves over again afresh every seven years. Now there can be no two opinions on the point that it is of vital importance that these chemical experiments should be well performed. For such an experiment every act of cookery is, and every failure is more or less vitally damaging to us. There can be no question of the close connection between the mind and the body. The body may be "a homely nurse," since Wordsworth says so, but the temper, disposition, and happiness of the mind committed to its charge greatly depend on its conditions. Most of the ill-temper, peevishness, and bad domestic manners which make up so large a part of household misery are but the fumes arising from an ill-regulated kitchen. So are the greatest part of the diseases that shorten life and make it bitter while it lasts. Health and disease, cheerfulness and melancholy, longevity and caducity are all issues of life or death which proceed from the stewpan and the spit. Now it is not reasonable to expect that these delicate experiments should be fitly conducted by wild Irish girls, whose bare feet are hardly extracted from their native bogs, however ready they may be to undertake them. These experiments, to be rightly successful, require the greatest accuracy of sight, taste, smell, and judgment. It is as absurd to expect even that high degree of skill which is called "plain cooking" from such an untrained peasant as the successful manipulation of retorts, crucibles, and blow-pipes by an English chaw-bacon.

Now we hold that a science so nearly touching the interests of the soul as well as of the body, is one eminently worthy of the study of our American matrons and maidens. And it is an encouraging symptom that so many of them have not been disobedient to the call of the excellent Blot. If the Homeric princesses were not above the homeliest domestic cares—if Penelope defended herself with her loom against her intrusive suitors, and the Princess Nausicaa did not disdain to take part in the family washing-day, surely our queens and princesses—the sovereigns of the sovereign people—need regard it as no derogation from their royal dignity to interest themselves in an art which is but the expression and embodiment of one of the most exalted and elegant of sciences—of chemistry applied to the uses of life. We do not demand or desire that they shall all perform in their own most proper persons the chemical experiments of which their kitchens are the laboratories. But it is well becoming the loftiest ladies in the land to understand the principles and the processes of this most subtle alchemy, were it but for the protection that such knowledge affords against the tyranny of the ruler of the roast. And it is but a very small proportion of American women who are entirely exempted from the necessity of the personal superintendence, if they are from that of the entire responsibility, of preparing meat in due season for their families. And a great responsibility it is, for the connection between good living and living well is of the closest nature. It may not be true in all cases, as a French wit affirms, that happiness consists in having a good stomach and a bad heart, but the two organs are in close proximity to each other, and act reciprocally the one on the other. And if a bad digestion does not always make the heart bad, it very often produces a very excellent imitation of it. The late eccentric Lord Dudley showed a nice appreciation of the affinity between religion and alimentation, when he exclaimed, on hearing of the death of an eminent bishop: "He was a good man, an excellent man! He had the best *melted butter* in all London!"

When the virtues of our hearts are thus indissolubly connected with the dishes on our tables, it is surely a mistake, to call it by no harder name, that so little regard should be paid in building our finest houses to the size, lightsomeness, airiness, and general convenience of the kitchens. It is a part of the too common vice of our people to regard show rather than substance. It seems as if our builders think any dark, confined, unsavory den good enough for the due performance of the functions of the most important minister of the household. The sanctuary in which the priestess performs the rites the end of which is to edify the living temples in which we dwell while on earth, and on which so much of the health of the indwelling soul depends, should be in every particular of light and air and all appointments of convenience suitable to the dignity of her great office. When the cook is duly cared for and her office reverenced as it deserves to be, and the light of the higher intelligences of the household shed on her labors from time to time to raise them to a higher plane of art, we shall then have meat set before us worthy to have grace said before and after it. For we have heard blessings, and long ones, too, implored over food which could not be granted excepting through a special miracle. The true way of showing gratitude to the Giver of all good gifts is to use his bounties wisely, and not to spoil them by our negligence or folly. No form of words, however pious, can undo the heavy burden of bad cookery or make an ill-dressed dinner fit for Christian eating. Perhaps it were more germane to the matter to ask the Divine blessing in the kitchen before the process of cooking the dinner is begun; for it is too often past praying for when it comes upon the table. We trust that the preaching of the Apostle Blot may be blest to our permanent edification, both of the body and the soul. We have special schools to teach the application of all kinds of sciences to practical uses, why not establish one of culinary chemistry? Or, better yet, why not have primary instruction in this most vital of all arts made a part of our common school education? Should the missionary labors of the admirable Blot be thus followed by a permanent improvement in good living, he will leave a savory memory behind him, and the date of his advent will be an era in the history of our civilization.

HOUSE-MOTHS.

THERE is as much charming suggestion in any article of feminine attire—a knot of ribbon, a little glove, a frill, a belt-clasp, a snowy edge of petticoat—as in a line of Tennyson's; and combine the suggestions in a toilette, there is a poem; but each year has its individuality. There are fossil years in which few poems are worn or written. There are years of warm vitality, war, and struggle, like the passionate days of a century back, such as the present; and warm vitality, war, and struggle are poem-makers and poem-stuff; hence, to-day, our streets and drawing-rooms burn and dazzle with the grace of those similar days that we had sighingly thought locked away in picture-frames for ever. Miss Adams, in "Leghorn hat and gown and coat of Chambèri gauze, flounced with crape, and trimmed with point and wreaths of roses," needs no change of toilette to step from the drawing-room of 1786 into that of 1866; while Mollie, with crinkled hair piled high, with bands and curls, with dangling sequins and cameos, pendant ear-rings, waist cut square on the bosom, train, hoop, festooned skirt, and a jaunty bit of crape, derisively styled a hat, lost somewhere on the top of her head, between curls and coils, is Josephine, is Récamier, a Watteau shepherdess, a Titian, but never that meagre Mollie, whom we recall, with hair smooth on either cheek, and a poky bonnet that covered her back hair, shaded her face, and tied under her chin.

Indeed, a bonnet is no longer a reliable, steady-going, prosaic thing, but an inspiration; pity that an inspiration cannot be "made over!" A boot is a bit of coquetry; there are permitted to it satin heels and crystal buttons. There are fashions and devices for stockings, of which in the old days there was only required spotlessness. Red hair and the back of the head, with other despised things, have their day. Miss Smith wears diamond dust; Miss Brown prefers gold powder. The entire feminine world flutters and palpitates over daring jackets, ribbons, sashes, beads, and bows, for which 1865 would have never had the pluck. There is a raid through all the centuries for what is pretty and startling. The click of their little boot-heels has more than once resounded in provinces strictly masculine. They have robbed us of hat, necktie, coat-tail, vest, shirt, and boots, and we submit

without an attempt at revenge, unless it be an intrepid doctor, here and there, solemnly dissecting a poor blue veil or an innocent green gown, and determining to a grain the arsenic contained therein. Broadway is a picture gallery *en promenade*. In our drawing-rooms are revived the days of the Revolution and the Consulate. Plain girls have developed prettiness; pretty girls are beautiful; beautiful women are superb; all feminity apotheosized in a continually ascending scale of loveliness.

To every good, however, is a reverse side of evil. With this increase of beauty increases also the curious pest classed by Ruskin as the "house-moth." It is found chiefly in cities, being rarely observed in the country, unless in the months of July and August, and is the most pernicious of its family, devouring clothes, houses, upholstery, gold, and diamonds, with the voracity of a dragon-fly and the omniverous appetite of a shark. It is not a little curious about its habitation, and exhibits as much delight in any glittering substance as the bower-bird; but is as reckless as an ostrich of its young. It is also as changeable as the chameleon, and as capricious as a butterfly; but, unlike every other insect and animal, possesses a set of entirely useless organs in reasoning powers and affections, which are so manifestly an annoyance to the creature, and incompatible with its habits, that warm discussions have arisen among naturalists, many respectable authorities holding tenaciously to the belief that, just as the Bushman is a man lapsed into bestiality, so the "house-moth" is a woman lapsed wholly to bonnets and back-hair; and not without some show of reason, as so startling is the likeness of the creature to what we call a house-wife, that we have frequently seen a young man in full pursuit of one, evidently deceived by its extraordinary resemblance to a woman. Nothing can exceed the beauty of its appearance in its prime, unless it be its insignificance in the shrivelled and faded decadence to which, sooner or later, it is sure to arrive; and yet, spite of its insignificance, it is the most terrible and relentless enemy of man, devouring not only his means but, like the spider, its mate also: his tastes, comfort, and very individuality, till he is resigned at last to sink into—Mrs. House-moth's husband. Worst of all, though supposed indigenous to Europe, it is found to flourish equally well in our own hemisphere, and though a remedy has been anxiously hunted, the means of preventing its increase have not yet been discovered.

True, that eccentric logician, Fact, suggests that unused feminine energies and powers work off in ribbon and trimming outbreaks, for want of better outlet, and that women seize on fashion-plates with an intensity produced by mental starvation; but Fact, as all the world knows, is a theorist; and we ask ourselves, apprehensively, if there is no remedy—is there not, at least, a method of discerning our destroyers? We know the death's-head moth by the marks on the thorax, and can distinguish the humming-bird moth from its namesake; but by what subtle analysis or master-stroke of genius can we seize on the essential difference between a house-moth and a woman? Louis le Grand was reduced to Louis, a shivering, bald-headed nonentity, in a stroke of the pencil, when Thackeray robbed him of wig and buskins. Who will inaugurate a calico test in America—they have already a club de la Sainte Mousseline in Paris—and show us Mollie in print gown, and with hair brushed behind her ears, confronting Mollie in diamond dust and white velvet? and subtracting Metternich curls and Lamballe hats from the average Mollies, what will be the average remainder? It is an anxious question for a bachelor deeply conscious of his ignorance and defenceless condition. Who will answer it?

JEFFERSON DAVIS'S BILL-OF-FARE.

THE uproar about Jefferson Davis's health has led to the publication by the New York *Times* of his bill-of-fare at breakfast and dinner for one week, in order to show that his diet has had nothing to do with the decline of his health. The document, which the correspondent of the *Times* calls by the impressive name of a "schedule of meals," certainly proves that whatever the cause of Mr. Davis's weakness may be, it is not want of food; but we at the same time feel bound to add that it does not reveal very extraordinary resources on the part of either the caterer or cook of the fortress, according to the notions of variety current in this part of the world. He had mutton chops three times in the week; he had beef-steak four times; he had veal cutlet three times; pork steak he was only treated to once, but oysters appear to have been supplied to him at discretion. They made their appearance at every meal, either "panned" or stewed, and we notice with pleasure that that excellent anti-scorbutic, onions, was supplied to him regularly every day at his dinner. It may seem rather hard that "a scholar and a gentleman" should be condemned to such uniformity of diet, and some boarders at New York hotels will doubtless think the fate of a man so fed as little better than slow starvation. The gentleman who writes the lugubrious articles on this subject in the *World* and *Daily News* very probably draws on Mr. Cranston's larder twice a day, and therefore must shudder on reading Mr. Davis's "schedule of meals." But it must be remembered that everybody does not live in New York hotels, and the food served to the prisoner at Fortress Monroe is probably twice as varied as that which he would get on nine out of every ten plantations in the South. We shall not compare it, as the *Times* does, to the stuff served out to the unhappy men who were confined at Andersonville. No matter whether Davis was responsible for the horrors of the prison pen or not, we owe it to ourselves to treat him like a human being, not like a wild animal. But we may fairly compare it to what he would get if he were staying on most out of the way plantations, and ask him frankly whether he would get beef-steak and oysters and veal cutlets half as often as he does in prison. The fact is, that most Southern men, who are not expert with their rod and gun, are, like farmers and country gentlemen everywhere, generally less familiar with fresh meat and fish than it is desirable they should be. One high official of the Confederacy gave a dinner to a distinguished foreign traveller, some years ago, on his plantation, and the bill of fare contained ten courses, all pork, but, of course, dressed in different styles, the reason being that there was no butcher or market within thirty miles. Davis having long resided in Washington must have become used to more generous fare, but then what he gets in Fortress Monroe is so very much better than what the mass of his countrymen get that we think he cannot in common decency complain.

Correspondence.

TOWN MEETINGS FOR GREAT CITIES.

TO THE EDITOR OF THE NATION:

AN instructive article in THE NATION of May 15 enquires why it is that our American cities are the strongholds of conservatism, while in Europe it is from the cities that all progress proceeds. To this two answers are given: first, that unmixed universal suffrage makes our cities formidable; second, that trade has played a selfish part here as everywhere. These reasons are just and, perhaps, sufficient; we may add the consideration that we are in this country free from the two influences which chiefly cause the intense conservatism of the rural districts abroad—the great estates, which rule despotically over the farming population of England, and the ignorance and stolidity which prevail in this class in all parts of Europe. There is still another view which seems to deserve consideration.

Mr. Mill says: "The spirit of a commercial people will be, we are persuaded, essentially mean and slavish, wherever public spirit is not cultivated by an extensive participation of the people in the business of government in detail." In these words, as it seems to me, the solution to this problem may be found.

It is a curious fact that while, in history, cities have been the main source and the most conspicuous theatre of popular liberty, and while municipal government, as known in history, is identical in its nature with the pure democracy of our New England town governments, the term "city," venerable from these associations, is applied by us to communities which have stripped themselves of practical political rights to almost the furthest extent possible—retaining only the right of voting for officers, and the somewhat burdensome privilege of serving on juries.

The reason that the cities have thus disfranchised themselves politically is not far to seek. It is nothing more nor less than indifference to the public welfare. As a town becomes populous and rich, and its interests become wider and more complicated, the weight of private business, too, presses more and more heavily upon its citizens, and they find that they must choose between making a little less money than they otherwise might and withdrawing their attention from the affairs of the community. So they procure a city charter, the object of which is that they may have all their time to themselves, for their own private concerns, leaving the affairs that concern all alike to the uncontrolled management of hired officials. We lament the neglect of "primary meetings," and indeed of voting at all, by the wealthy and educated among the citizens. What wonder, when they have given up the greater right, that they should neglect the lesser? that when they will not attend to public affairs in person, they should come to care very little that those to whose control they leave them are corrupt and incompetent? It will only make the difference of a mill or so on the dollar in their taxes, and they will more than make that up in the time that they thus spare from the public interests and devote to their own. It was not thus the citizens of Athens and Rome, Florence, Ghent, and London argued;

had they so done, the history of those cities would have read very differently.

It is a proud day in the annals of a New England country town when, after much waiting and longing, it counts at last the magic number of ten thousand, and obtains a city charter. It reads well in the newspaper. It puts the town up into the aristocracy of towns. There is something respectable in the name "city." "Mayor" is a more dignified title than "Selectman." So the city government is inaugurated with many speeches and much ringing of bells and much firing of salutes. The people cease to govern themselves, and only choose, once a year, those who are to govern them. Instead of perhaps twenty hours in the twelvemonth, each citizen has now to bestow only ten minutes or so on the public business. Whereas he went two or three times in the year and listened to long debates on schools, roads, and bridges, and made his decision and gave his vote on each question as it came up; now he has nothing to do but put a slip of paper in a box containing a list of names that somebody has been so good as to prepare for him, and he has done his duty as a citizen, and there is all.

No, not quite all. Soon his tax bill comes round, and he finds that he has a good round sum to pay for the privilege of living in a city and shifting his duties and responsibilities upon somebody else. He sees incompetence, waste, fraud, extravagance; costly public buildings going up, when the community is already over-burdened with taxes; costly public entertainments, municipal junketings, fat jobs. The work is paid high and not done well. In the midst of all this, the citizens are powerless. They have parted with the power of controlling their own affairs, and if they can contrive to fix the responsibility of the incompetence, waste, fraud, and extravagance upon any individual member or members of the city government—which is generally impossible—the only remedy is the tedious and insufficient one of turning him out of office, if they can, when the mischief is already done. No doubt this picture is over-drawn, or rather drawn from an example which is single in its enormity. But in all our cities the tendency is in this direction, while in the New England town governments the rule is that the work is well and cheaply done.

We may be told that all this is true, but yet that these abuses are a necessity—that the affairs of a large city cannot be transacted in the same way as those of a small town. No doubt this is so to some extent; but at any rate, the adoption of a city charter can be put off as long as possible. If Boston is too large to be governed by town meetings, Springfield and New Bedford are no larger than Florence and Paris were in their days of municipal splendor. Moreover, we must recognize the fact that the city organizations present the most perplexing and threatening aspect of all our Northern institutions. It concerns the nation—not merely this half million of men—that the first city of the continent should have a respectable and decent government; and what New York is, that, in their degree, all cities threaten to become. For all are alike characterized by almost complete abnegation of practical democracy, and by the fact that what is left of political power is to a great extent in the hands of foreign-born citizens, who have not the traditions and do not understand the usages of American democracy. The American institution of the "city" may be boldly declared a complete and (tacitly) acknowledged failure.

Already a very decided step has been taken towards the entire overthrow of democracy in these communities, in the Metropolitan Police, established in New York and other places. It is certain that there is nothing that more concerns the future success of our democratic institutions than the discovery of some means of reconciling in large cities municipal liberty with the welfare of the community. If democracy and good government cannot be reconciled, democracy must certainly go by the board, as is the case in these instances. But we should not give up the point too hastily. It is not democracy that is really in question; for democracy hardly exists in these communities. Political power resides not in the people, but in the mob; and this governs not in person, but by agents.

The practical question is, Why need the inhabitants of the cities be excluded from all actual share in government? Why should not the people of New York decide themselves upon all questions of magnitude and universal interest, instead of leaving their decision to the Board of Aldermen? Why should they not be allowed to say whether they will have a new city hall, an underground railroad, or one in the air—why leave these questions to the tender mercies of the lobby? It is as easy to drop a ballot with "yes" or "no" upon it as with the name of Hecker or Hoffman.

It will be objected that the right of voting upon these subjects would be a doubtful good if unaccompanied by free and exhaustive public discussion; and that, of course, town meetings in the New England style would be impossible in cities even much smaller than New York. This is very true. One method, however, occurs to me by which it might be possible to obtain this discussion in a different way. The Romans had an institution, the *concio*, invented to meet this precise want, the principle of which might perhaps be adopted by us. The *concio* was not a private, irresponsible meeting, like a caucus; but was held under the auspices and presidency of some magistrate, who controlled its proceedings, and by whose permission alone any citizen could address it. It was characteristic of the Romans thus to lodge excessive power in the hands of their magistrates; but this is not an essential or desirable feature of the institution. The peculiarity of the *concio* is that, while it was legal and official, it was strictly *preliminary* in its character. In the Roman *comitia*, as at our city polling booths, there was nothing done but to vote. The practical Roman mind saw that this was insufficient, and devised the *concio* as a necessary adjunct to the *comitia*. Voting was still done in the regular and established assemblies, which not only chose magistrates, but passed laws; while this preparatory meeting was called beforehand for the discussion of important measures.

Something analogous to this could easily be engrafted upon our municipal system, and would give it precisely the element it lacks, of constant and direct supervision of municipal affairs by the people. A certain class of subjects, of course, much more limited than in the New England towns, and embracing only matters of first importance, might be reserved for the vote of the citizens to decide. It should include, for instance, the levying of taxes, all extensive public works, and the general policy as regards schools, police, etc. The city authorities should draw up propositions under these various heads, and call a public meeting for their discussion. The meeting being simply for debate, not for business, of course no votes would be taken and no amendment adopted. The authorities could, if they saw fit, amend their plans after the discussion—whether convinced by the arguments advanced, or satisfied that they would not pass in the shape presented. Then let the propositions, in their final form, be printed and put in the hands of every citizen, and the vote be taken by yes and no upon an appointed day.

STRAHAN & COMPANY.

FINANCIAL REVIEW.

NATION OFFICE, Monday, May 28, 1866.

THE money pressure has at last abated. On Saturday money was fairly abundant at 7 per cent., and to-day no increased demand is apparent. Owing to the willingness of the Treasury Department to receive, in payment for gold, deposit and debt certificates and compound interest notes, the last payments were made without difficulty. Some ten millions of these securities were sent into the Sub-Treasury by the banks. The prospect is now fair for a return to ease in the money market, and as the Secretary of the Treasury, by throwing away thirty odd millions of gold at 8 to 10 per cent. below the present price, has deprived himself of his control of the gold market and placed it out of his power to inaugurate any vigorous measures of contraction, the general belief is that we may see this summer renewed speculation in the currency and in stocks, and in all articles which are represented by money. This is just the opposite of what was expected by sound men at the commencement of the session of Congress. But it is idle to resist the logic of facts or to rely upon secretaries of the Treasury.

A better feeling prevails in commercial circles. The advance in gold has led to a nearly corresponding advance in produce, and, though prices here are far too high to admit of shipments at a profit, holders seem to think that the home market will absorb the surplus. Accounts from the South continue to vary, but we see as yet no reason for altering our estimate of the growing crop—2,000,000 bales.

The panic in England has unsettled the exchange market here. Sixty day bills are difficult of sale. Short sight bills on the best houses are current at 110¾ to 111. The shipment of specie last week was $9,350,000, and the present estimate is that six to seven millions will go out this week.

The Sub-Treasury balance after being $115,000,000 is down to $111,000,000, of which probably not over $30,000,000 is gold. On Thursday next the interest on $35,000,000 of debt certificates will cease, and it is likely that by that day the bulk of them will be presented for payment, thus dislodging a corresponding amount of currency now lying idle in the Sub-Treasury.

Stocks are rather disposed to react from the depression of the early part of last week. The cliques which paid a commission for the use of money more than once last week, and which would have been forced to disgorge had the pressure continued a few days longer, are now very anxious to get up a speculative furore in order to dispose of their load. Active movements have been inaugurated in New York Central, which sold on Saturday at 95¾, and to-day at 96½; in Pittsburgh, which sold as high as 96; in Reading, which sold on Saturday at 111½, and to-day at 112; etc., etc. Erie is neglected, and the tendency downward. Large lots of Government bonds arrived here from Europe, for sale, by the steamers last week, but the rise in

gold prevented their being sold at a profit, and some of them were reshipped on Saturday. Considering the sharpness of the money pinch and the steady receipts of bonds from abroad, our market for Governments has been remarkably steady.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	May 21.	May 24.	May 28.	Advance.	Decline.
United States Sixes of 1881	108⅞	108¾	109	¾	....
5-20 Bonds, old	101⅝	100⅞	102	1⅛	....
5-20 Bonds of 1865	102	101¾	102	¾	....
10-40 Bonds	96	94	95⅛	1⅛	...
7.30 Notes, second series	102¾	101	102	1	....
New York Central	93¾	93¾	96	2¼	....
Erie Railway	73¼	67⅝	62⅝	....	5
Hudson River	113	111⅝	113⅜	2	....
Reading Railroad	107⅝	109¾	111⅝	2	....
Michigan Southern	79⅛	78¾	78¾	....	....
Cleveland and Pittsburgh	85⅛	86¼	95	8¾	....
Chicago and North-western	28⅝	27¾	28	¼	....
" " " Preferred	58¾	57	58⅛	1⅛	....

American Gold	130⅛	139⅛	137⅜	....	2
Bankers' Bills on London	109¾	109⅞	109¾	....	⅛
Call Loans	6	7	7	....	....

The financial panic which broke out in London on 10th inst. and culminated on the following day in the practical suspension of the Bank of England, was one of the most curious events of modern times. It would seem that even as late as 9th May well-informed persons apprehended no danger. For some time past the financial horizon on the Continent had been dark and lowering. An imminent prospect of a general European war had led to bank suspensions in Prussia and Italy, a decline of 15 per cent. in the public securities of these kingdoms, a sympathetic fall of 6 to 8 per cent. in the French rentes, a still heavier fall in railroad and other speculative stocks, and a general paralysis of mercantile credit and commercial operations. It should have been expected that these disturbances would react upon England, which is closely allied in a mercantile sense with the leading Continental nations. And it might safely have been inferred that such English banking institutions as had been doing business on too expanded a scale might find it difficult to weather the storm. Nothing of the kind, however, it would seem, was generally suspected even so late as Wednesday, 9th May. On the morning of Thursday the trouble began with unusually heavy demands for money by depositors in joint-stock banks and limited liability companies. Within the past five or six years a very large number of these concerns have been established in London. Many of them have enjoyed such high credit and offered such liberal terms to depositors that vast sums have been lodged with them. These moneys have been re-invested by the companies in mercantile paper, advances on produce, foreign securities, etc.; and the rivalry among the banks being keen, each institution has striven to make larger dividends than its neighbor, and, to do so, has stripped itself bare of cash. Such a system was well enough for fair weather. The first storm would, of course, develop its unsoundness. On Thursday, 10th May, depositors in various joint-stock banks in London demanded their money. The banks did not have it to give. In dismay, they rushed to the Bank of England for assistance, and besought the directors to re-discount their bills. In many instances the bank did so. But in the case of Overend, Gurney & Co., one of the oldest banks in England, it refused, and the house (a limited liability concern) went by the board. This precipitated the panic. On Friday, 11th, every joint-stock bank was suspected, and every depositor wanted his money. The Bank of England, in the course of the day, lent $20,000,000 to its embarrassed friends; but this was insufficient to supply the demand. On Friday night the bank's reserve was down to $15,000,000, and to save it next day Government authorized an over-issue of notes—what we should call in this country a suspension of specie payments. This, according to the latest accounts, seems to have allayed the panic. A similar step in 1847 and 1857 checked the alarm, and the bank experienced no difficulty in restoring itself to a safe position under the law.

This English panic was not unlike our panic of 1857. Then in this country, as now in England, overtrading had been the rule. Our banks and moneyed institutions had been lending money too freely; a sudden increase in the demand for specie for export diminished the bank reserve, alarm arose among depositors, a run upon the banks was the result, suspension became inevitable, and every one whose position depended upon the negotiability of mercantile paper or the sale of securities became insolvent. This is precisely what has just happened in England—though there events appear to have followed each other with unprecedented rapidity. The ultimate result in such cases depends upon the liquidation which follows panic. In this country it was bad, the assets of the wrecked institutions proving generally unavailable. How it will turn out in England remains to be seen. If the joint-stock banks and limited liability concerns have made many more such investments as the rebel cotton bonds, the liquidation will be unsatisfactory and a long period of distress may ensue.

In this country the British panic has had the effect of causing a specie shipment of nearly twenty millions in two weeks, and of putting up the price of gold ten per cent., in spite of the unskilful opposition of the Treasury Department. It has not directly affected our money market, nor has it exercised any material influence upon the price of our staple exports or our securities. So long as we remain satisfied with a depreciated paper currency, we shall have panics and revulsions of our own, but we shall not be liable to participate in the crises of nations which trade upon a specie basis. Some bonds and stocks have come here from Europe, but the sudden advance in gold has counterbalanced the foreign decline in our securities, and most of them have been reshipped, on the calculation that our heavy shipments of gold will secure for them a better market in London than they can find here at present.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not deteriorating in the slightest degree from its many positive excellences, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fullness, sympathetic delicacy and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

FINANCIAL REVIEW 702

Topics of the Day.

THADDEUS STEVENS has introduced a reconstruction bill which is so remarkable for moderation and good sense and practicalness that it stands in very striking contrast to some of his speeches, and we wish most sincerely that he had thought of it eight months ago, when he was talking a great deal of "sad stuff" about confiscating the whole land of the South and dividing it among the negroes. The bill is in fact precisely the plan of reconstruction which Mr. Johnson ought not to have carried out, for that is not his business, but to have recommended for adoption to Congress at the outset. We do not know whether it is not now too late to have it acted upon, but we do know that it ought not to be too late. No mode of re-organizing the States lately in rebellion will ever be permanently successful, either satisfy the conscience of the country or be found expedient, that does not extinguish for ever legal distinctions grounded on difference of race. This Mr. Stevens's bill would do for the present, if enacted; its only fault, to our mind, is that it is a *bill* and not a constitutional amendment, and therefore would not place equality before the law beyond all question or debate hereafter.

SECRETARY SEWARD has sent in to the House of Representatives, and one would suppose sent it in with some reluctance, a report of the provisions recently made in the various Southern State constitutions and codes in reference to the freedmen. None of all these States allow negroes, or mulattoes, or any persons of color to testify in any cases where their own rights of person or property are not in issue. Aside from this discrimination, the action of several of the States seems to have been not unfair. Georgia, for instance, has passed a civil rights bill which almost exactly repeats the phraseology of the Congressional civil rights bill, and, curiously enough, repeats with literal exactness the phraseology of a certain inaccurate quotation from that bill which the President made in his veto message. We are not, however, disposed to quarrel with Northern inspiration of Southern laws for freedmen. There is need of more of it. Florida deliberately disarms her black inhabitants, and makes it a misdemeanor for a colored person to have in his possession any weapon or powder or shot enough to kill a crow in the corn, without having first got license from a judge of probate. Such misdemeanor is to be punished by whipping and exposure in the pillory. South Carolina does the same thing, and in South Carolina "rebellion" is hereafter to be a felony without benefit of clergy. Teachers of freedmen shall procure a license. A black man convicted and fined shall pay his fine immediately, and if he cannot shall be whipped. Black children are to be brought up in habits of sobriety and industry, or the magistrate may take them from the parent and bind them as apprentices—a provision which, if made generally applicable, would be very annoying to white parents. Bad white boys will now have nothing better to do than inform against bad black boys. Mississippi allows no negro not living in a corporate town to lease or rent lands or tenements. Any white Mississippian may arrest any black one who has deserted his master's service. There are other such provisions in these and other States, and the joy in the North over the passage of the civil rights bill was not causeless, nor, great as it was, exaggerated.

THE bill which continues the Freedmen's Bureau act in force for two years after next April will undoubtedly pass the Senate. That it will not be vetoed is hardly to be expected, although those features of the former bill which provoked most opposition have been considerably softened. Thus, in providing for the education of freedmen, the commissioner is restricted to co-operating so far with the charitable people of the country as to furnish rooms for school-houses and protection to teachers. But the freedmen's courts are to be kept in existence till State legislation conforms itself to the civil rights bill and the disturbed relations of the States to the Union are restored. This section of the bill probably secures it a veto. We could wish its passage placed beyond doubt for the sake of one excellent provision: the President shall reserve from sale public lands not exceeding in all one million of acres in Arkansas, Mississippi, Florida, Alabama, and Louisiana, and these tracts shall be assigned in parcels of forty acres and less to loyal refugees and freedmen. There are certain freedmen to whom the public faith is pledged, if a secretary of war and two generals by official act can pledge it, and furthermore it is hoped that the rents from this source may make the Bureau self-sustaining. Judiciously managed, the power thus lodged in the hands of the commissioners might be made not only to confer a benefit on the recipient of land, but also to have a great and salutary effect on the prospects of the whole laboring class of the South.

GENERAL SCOTT has died full of years and honors. The gradual decline in his physical condition since his retirement, and the gigantic scale on which the public has seen military operations conducted by younger men, have done something to dwarf the proportions of his exploits, and to lessen the sensation caused by his death. He was one of the great famous men of this country, one of the most skilful, daring, fortunate of soldiers, and one who had, perhaps, accomplished more with smaller means than any officer of his day and generation. He was inseparably associated with the very earliest triumphs of the arms of the Union, and his campaigns in Mexico, brilliant before, have derived fresh illustration from the recent French operations in that country.

THE advocates of an eight hour law have certainly undertaken to drive their wedge butt end foremost in fomenting the present formidable strike among the ship-carpenters, joiners, and caulkers, whose grievances are slighter than those of any other mechanics. It will be remembered that their organizations in this city resolved, 1, to regulate the number and wages of apprentices in the ship-yards; 2, to exact equal wages for all rates of workmen; 3, to regulate the dis-

charge of workmen; 4, to consider the least overwork at least a quarter day; 5, to hold the employer to these rules, and, in case of non-compliance, to "suspend" him; 6, to prevent the employment of workmen not members of the association, and to put an end to the custom of using the aid of ordinary carpenters. We shall not stop here to denounce the folly and the injustice of such pretensions and such a spirit. We notice that the infection, worse than the cholera, has spread to Boston, and that the caulkers there, even in yards where there has as yet been no difficulty, have refused to work on vessels towed thither from this city. The ship-owners and merchants have taken counsel together, and, being determined like those of New York *obstare principiis*, have given warning that they will make a test case of the *Archer*. The struggle promises to be interesting, as the caulkers have been able to make good savings, and are receiving material support from all parts of the country, including that of associations not embracing their craft.

THE cholera has again appeared in the lower bay, the steamships *Peruvian* and *Union* bringing it from Liverpool. The passenger-list of each vessel is a full one, and so, unhappily, is that of the victims of the disease. The almost superstitious inhumanity of the residents near quarantine, both on Long Island and on Staten Island, forbids the landing alike of the well and of the sick, and even the interment of the dead. New Jersey is as inhospitable as New York, and so the treatment is confined to the infected vessels themselves or to cholera-hulks, with an inevitable sacrifice of many lives that might have been preserved, and *ought* to have been, however harsh a judgment be contained in the word. It is shamefully discreditable to our sympathies and our foresight that after years of experience of imported pestilences we have still no permanent and adequate provision for them, and always find ourselves as it were unprepared.

THE slow-acting Senate have at last reached and passed the bill to free the railroads of the country from State monopolies. They have added two amendments in which it is hardly likely the House will refuse to concur. The President, for his part, is fairly pledged to endorse the measure.

BY the latest advices the preservation of peace in Europe was still regarded as possible, but barely so. Diplomatists were busy concerting, and others probably disconcerting, projects for a general European congress, before which the questions of Schleswig-Holstein, Venetia, and Federal reform in Germany were to be brought. No formal propositions had as yet been addressed to the courts of Vienna, Berlin, and Florence. The war movements continued uninterrupted. Gen. Benedek, the commander-in-chief of the northern army of Austria, had issued the first order of the day to his army, dated May 12, from "temporary headquarters" at Vienna, and firm but defensive in tone throughout. It was regarded as doubtful whether the middle States would enter into a defensive and offensive alliance with Austria. As yet, military men regarded the preparations as not sufficiently mature for the opening of a campaign on either side, but vague rumors of an approaching collision were current. Already the Prussian Government had demanded of the Austrian satisfaction for a trivial violation of the frontier committed by a patrol. On the other hand, the popular demonstrations in Prussia in favor of peace were daily growing more serious, and numerous riots, caused by the calling out of men for service, were reported. The citizens of Cologne, Bonn, Königsberg, and Berlin were the loudest in denouncing the war. Opposite manifestations were numerous on the part of Austrian communities, and Italy was all ablaze with warlike enthusiasm. The Italian ministry, however, had suffered a parliamentary defeat, in consequence of which the Minister of Finances resigned. The national assembly of the Danubian Principalities has persisted in conferring the throne upon Prince Charles of Hohenzollern, the objections of the Paris conference notwithstanding. The Provisional Government had submitted a project for a liberal constitution. A bloody conflict which took place on the 16th of this month, between some Roumans and Turkish soldiers in Giurgevo, will undoubtedly serve to complicate the situation.

CONGRESS.

WASHINGTON, May 30, 1866.

THE wholesome result of the protracted private conferences held by the Union senators was first exhibited in the vote yesterday by which the disfranchisement clause was unanimously rejected from the constitutional amendment. Its further good effects may be expected in greatly abridging the speeches which honorable senators may feel themselves called upon to make in defining their positions on the whole measure.

The feeling gains strength that the amendment of the Constitution, as finally agreed to in substance by the senatorial conference, will command the support of the loyal people of the country. So much expression of confidence and good feeling has not been manifested for weeks, and the prospect now is that Congress will harmoniously settle every important question before them involving the political rights of the States late in rebellion, and be prepared to go home in six weeks from the present time.

DIARY.

May 28.—In the Senate, the House bill to facilitate railroad communication between the States was discussed at length by Mr. Morrill in opposition.

In the House, the Committee on Pensions was instructed, on motion of Mr. Stevens, to bring in a bill to double the pensions caused by casualties of war with the rebel States. A resolution looking towards limiting the period of labor in the Government printing-office to eight hours per day was lost—yeas, 8; nays not counted. The tax bill was taken up, and the House, by a vote of 66 to 55, reversed its former decision to prohibit the publication of the income tax-lists in the newspapers. Mr. Farnsworth moved an amendment requiring the advice and consent of the Senate before any removals from office are made by the President. Rejected—yeas, 57; nays, 66. The tax bill was then passed—yeas, 110; nays, 11.

May 29.—In the Senate, the vote was taken on Mr. Johnson's motion to strike out the third section of the proposed constitutional amendment, being that disfranchising rebels until 1870. The motion was adopted—yeas, 43; nays, 0. Mr. Howard then offered as a substitute for the section stricken out, a disqualification of all persons who engaged in rebellion from serving as officers of the United States. Also, sundry other amendments. Mr. Sumner offered an amendment embodying the principle of universal suffrage. The various amendments were postponed. The House bill to promote inter-State intercourse by granting equal privileges to all railroads to carry freight and passengers from one State to another, was discussed, amended, and passed—yeas, 22; nays, 19.

In the House, the bill to amend and continue in force for two years the act establishing the Freedmen's Bureau was passed—yeas, 96; nays, 32. The bill reported by the Reconstruction Committee, to restore to the States late in insurrection their full political rights, was debated by Mr. Ashley in its favor and Mr. Latham against it.

THE FREEDMEN.

THE assistant commissioner of South Carolina reports that the inspection tour of Gens. Steedman and Fullerton was a satisfactory one to them; that they found no flaws in the management of Bureau affairs in that State. The planters came forward in a body and prayed that the Bureau might remain. There is much suffering for food amongst the poor, both white and black, in South Carolina. The Bureau is doing what it can to alleviate it. Gen. Sewall, Inspector General of the Bureau, reports that he found the condition of freedmen's affairs in North Carolina quite different from the representations of the President's emissaries. Gen. Whittlesey, too, has made a very complete defence of himself to Gen. Howard. Whether influenced or not by these replications in their rear, Gens. Steedman and Fullerton are said to intend reporting favorably on Gen. Tillson's administration in Georgia.

—Gen. Stoneman's report on the Memphis riots implicates strongly the police, who are principally Irish, and "who consider the negro as their competitor and natural enemy." Many of the victims were discharged soldiers, and bad feeling seems to have been excited by the employment of colored troops (by the provost-marshals) in arresting white civilians, and of the police in arresting colored soldiers for real or assumed breaches of the peace. Twenty-four negroes were killed outright. The city recorder is known to have incited the rioters to "clean out" the colored population. "Very few paroled Confederates were mixed up with the rioters on Tuesday and Wednesday, *the large proportion of the rioters being registered voters.*" The Congressional Committee have not yet finished their investigation, though they have examined more than one hundred witnesses. The "Phœnix Educational Institute," a building that will accommodate 500 scholars, has arisen out of the ashes of the burnt school-houses, and was opened yesterday with marked ceremonies by Gen. Fisk and others.

Notes.

LITERARY.

ONE of Thackeray's kindly suggestions is just now being carried into effect in England. "Before the century was actually in its teens," said he, "we believe that George Cruikshank was amusing the public. Is there no way in which the country could acknowledge the long services and brave career of such a friend and benefactor?" A committee has been formed in London, with Mr. Ruskin at its head, for the purpose of collecting a sum of money to be presented to Mr. Cruikshank as a testimonial not only "of admiration for his genius, but of the universal respect in which his exercise of it and his personal character are held." Mr. Cruikshank is now seventy-three years old, and it is hoped that the sum raised may be sufficient to make comfortable provision for his old age. Many of the most distinguished artists and men of letters not only of England but also of France have joined in the subscription. There must be many also of our own readers who would take pleasure in showing their gratitude to the old man for the entertainment which his drawings have often given them, and for the pleasant memories of childhood with which they are associated. A subscription toward the fund has already been begun in this country, with the names of Longfellow and Lowell at its head, and we learn that the names of those desiring to subscribe may be sent, with the amount of their subscriptions, to Mr. Charles E. Norton, of Cambridge, Mass., who has been asked to take charge of subscriptions in this country.

—It is to be hoped that before Messrs. Leypoldt & Holt republish the translation of Beethoven's letters by Lady Wallace, they will have them revised by some competent person. Mistakes of translation and of apprehension are very frequent. Lady Wallace translated Mendelssohn and Mozart very carelessly, and the fatal facility of error seems to have grown with her. It is regrettable to have such books for ever spoiled for English readers, for they will probably never be retranslated. The letters of Beethoven are interesting in themselves, but when from Mr. Thayer's expected biography we learn the pitiful story of his life, they will be doubly so. They give us, however, an idea of the moroseness and acerbity of Beethoven's character, and of his parsimony and selfishness. This correspondence has none of the charm of Mendelssohn's. It might all have been written from behind a banker's counter. The letters are principally about himself, his trials, his straitened circumstances, and his need for money. There are few allusions to other persons or things, no reflections of love for nature, no signs of reading or reflection. The expressions of passionate attachment to the Countess Guicciardi are almost the only relief.

—The French as well as the English are publishing the romances and *fabliaux* relating to their early history. Several volumes have been printed at the expense of the Government, and many more have been issued by the enterprise of private individuals and publishers. "La Chanson d'Antioche" bears the same relation to the first Crusade that the biography of Eginhart does to Charlemagne, or the work of Joinville to St. Louis. It was written by Richard le Pèlerin, one of the followers of Robert, Count of Flanders. He knew all the persons of whom he speaks, and was personally present at the scenes he describes. On his return he wrote or composed the story o the adventures of the army of the cross. This in the next century was rewritten by Graindor de Douai, and soon became exceedingly popular, so that it was often thrown into the teeth of a troubadour as a mark of incapacity that he did not know a single couplet of the "Geste d'Antioche." It really is the Iliad of the first Crusade by its simplicity, its realism, and its great beauty. In 1847, M. Paulin Pâris published the text; but the language of the old Trouvère is so very archaic that it was still inaccessible to the majority of modern readers. Very recently a cultivated lady, the Marquise de Sainte-Aulaire, has rendered into modern French this record of the heroic age of French history. It is by no means a paraphrase, but adheres to the style of the original with singular fidelity and success.

—A catalogue of catalogues will be a very welcome book to booksellers and librarians as well as to persons who are hunting for the title of some particular book or edition. Mr. Julius Petzholdt, the librarian of the Royal Library at Dresden, and the editor of the well known "Anzeiger für Literatur der Bibliothekwissenschaft," has prepared such a book. It bears the title of "Bibliotheca Bibliographica; Kritisches Verzeichniss der Gesammtgebiet der Bibliographie betreffenden Literatur des In- und Auslandes in systematischer Ordnung." It is published by Engelmann, of Leipzic, and is a goodly octavo of 939 pages. The first part gives lists of the books on bibliography, libraries, and bibliographial system. The second part presents the materials for the history of general literature, of anonymous, pseudonymous, xylographic, suppressed, personal, and iconographic literature, etc. The third part contains the list of works on the national literatures of various countries, and special catalogues of books in all the sciences and arts. Copious notes and remarks occur throughout, and there is added an index of all the names and titles mentioned. It is an invaluable manual for every librarian.

—There are two serial contributions to English magazines now being published which deserve notice and repay perusal, though very different in character. Mr. Walter Bagehot's series of articles in the "Fortnightly Review" on the English constitution contain the best and clearest exposition of the actual workings of the English Government that has ever been written. Without paying much attention to the origin and theoretical uses of the different parts of the Government, he explains intelligibly their present real functions. "Chesterfield, junior: A son's letters to his father" is the title of a number of brilliant articles in *All the Year Round*. They represent the progressive part of society and are a defence of the manners and sentiments of Young England, and Young America, too, against the objections of old fogy papas, and the prejudices of those who were brought up in the old, careful way. They are humorous and sensible, abounding in light irony and pleasant banter.

—Another change has been made in the constitution of the French Institute. In 1855, by an Imperial decree, a sixth section, that of politics, administration, and finance, was added to the *Académie des Sciences Morales et Politiques*. It was supposed that the Government was desirous of breaking down the majority of political opponents who governed the body. The new section consisted of ten members, while the others only had six each, and the subjects to be considered by the section were provided for by others. The change was besides distasteful to the academicians on the ground that men of political prominence, but without literary merit, might apply, and use their great influence to make themselves members. The ten members were also constituted by decree and not by election. The Government has at last seen the uselessness of this extra section, and, with the assent of the section itself and of the academy, has suppressed it, on the condition that the members shall be partitioned among the remaining sections. The word finances is also added to the title of the fourth section, formerly economy, politics, and statistics.

—The recent publication of an index by the Jesuit Father P. C. Sommervogel has revived an interest in the long unread volumes of the "Mémoires de Trévoux." In the year 1655 was begun the *Journal des Savants*, a review in our modern sense, and, as Voltaire calls it, "le père de tous les ouvrages de ce genre, dont l'Europe est aujourd'hui remplie." It soon gained great authority, and was even translated into Latin and circulated on the Continent. It still, after two hundred years, is the highest literary tribunal of France, all of its writers being members of the Institute, and presents solid, impartial, and dignified criticisms. As most of the journals which had been brought into existence by the *Journal des Savants* were edited by laymen, the clergy were desirous of having some organ of their own. The Jesuits therefore started, in 1701, at Trévoux, the capital of the little principality of Dombes, created by Louis XIV., and conferred on the Duc de Maine, the journal to which they gave the name *Mémoires de Trévoux*. Edited with ability, it soon became famous, and was a formidable rival to its great prototype. It withstood even the year 1762, and fought bravely against Voltaire and Diderot, but, after moderating its pretensions and changing its name, it was forced to succumb in 1782. Probably no paper has ever had so many intelligent correspondents all over the world as this. Intelligent and educated Jesuits, who have always made their missionary work subserve the cause of learning, were everywhere. Geographical information was received from India and Africa, astronomical observations from China and America, and the literary treasures of all countries were investigated by the patient followers of Loyola. But the journal did not confine itself to investigation. It gave itself up in great measure to controversy with Jansenism, with Protestantism, and with liberal thought everywhere. It was unscrupulous, too; treated its friends leniently and its opponents unfairly, and received plenty of abuse in return. In the ponderous volumes of this old journal can be found many interesting facts in the scientific and literary history of the last century. The patience and pains of le Père Sommervogel have rendered them accessible to students and investigators.

—The young and enthusiastic professor of archæology at the Bibliothèque Impériale, M. Beulé, has been in Rome during the early spring investigating the state of excavations there. In his lecture on that subject, on his return, he expresses his regret that the soil resting on what he supposes is the pavement of the Forum has never yet been removed. The ground is open

and without buildings, so that there will only be the expense of excavation to be met. He estimates the cost of removing the ground from the space of 150 by 60 metres to be about 300,000 francs. It is calculated that there have been 300,000 French visitors to Rome in the last thirty years, and the professor proposes a voluntary tax of two francs on each traveller, which he thinks would be collected from about half the number, to meet the expenses of the proposed excavation. M. Viollet-le-Duc strongly supports this plan in *Le Constitutionnel*.

—A favorite book in India is the collection of stories called in Hindustani "Baitâl Pachîsî," and in Tamil "Vedâla Kadai." The versions in the various Indian languages are all based on a Sanskrit work, the "Vetâlapanchavinsati," or "the five-and-twenty tales of a goblin;" part of which was printed in 1838. An English translation, made from the Tamil, had some years previously appeared in London. All the MS. Sanskrit copies differ as widely as do the modern versions current in India, but are easily traceable to one Buddhistic source. These stories are also to be met with among the Mongols under the name of "Siddhi-kür," the "corpse endowed with supernatural powers." Both the western and the eastern Mongols have their own version of the tales. A free translation into German of the former was made by B. Beymann early in this century. The Kalmük text has now been printed at the imperial printing-office, Vienna, with introduction, faithful translation, critical notes, and a glossary, by Prof. B. Jülg, of Innspruck. This is the first Kalmük text printed in Germany, and is a specimen of very beautiful workmanship. Prof. Jülg is about to publish nine supplementary tales in the Eastern Mongolian dialect. Oriental scholars and all interested in comparative mythology and the migration of tales owe many thanks to Prof. Jülg for his important labors.

SCIENTIFIC.

Measuring Steam or Water-power.—With the existing means and methods of measuring mechanical power, it is well-nigh impossible to ascertain with precision the actual power which any given engine is capable of furnishing, or which is necessary to drive any given set of machinery or tools. Steam and air engines are sold, and power is let, by very rough and uncertain rules and estimates, on whose application buyer and seller, landlord and tenant, can seldom agree. There is no good reason why power should not be sold with as much precision as gas or sugar, if only a metre to measure it or scales to weigh it could be contrived. We find in the proceedings of the American Academy of Arts and Sciences, at Boston, a description of a new dynamometer, intended for this very purpose, which has been invented by Mr. S. P. Ruggles, the curator of the museum of the Massachusetts Institute of Technology. This admirable invention accomplishes two objects; first, it measures the exact amount of power which is being consumed, at any instant of time, in driving a machine or set of machines, indicating every change in the force required, as the work done varies from instant to instant; secondly, the apparatus adds up and registers the total amount of power which has been used by any machine or set of machines during a day, a week, a month, or any desired time. The instrument is at once elegant in design, simple, and therefore cheap in its construction, easily verified and proved at any moment when in operation, and of very easy application to any machine, whether the power used be variable or constant in amount. The apparatus admits of a great variety of forms. It may be applied to the end or any other part of a running shaft, and the proportions and dimensions of the several parts admit of the same variety as do common scales, which are of all sizes and qualities, from those which weigh a canal-boat with its cargo to the chemist's balances, which must not have more dust on one pan than on the other.

This valuable instrument meets a pressing want. Hereafter mechanical power can be sold by the thousand or million foot-pounds. A very fruitful source of litigation will be thus destroyed.

Nocturnal Growth of Plants.—M. Duchartre has communicated to the French Academy some interesting observations on the relative growth of plants by day and by night. It has generally been taken for granted that plants grow most rapidly during the daytime, but exact measurements have not often been made, and the results of the few botanists who have given attention to this point are contradictory and unconclusive. M. Duchartre made continuous observations during the month of August upon six plants, belonging to different families, and growing in the same soil under normal conditions, but without any special care. The plants were a grape-vine, a hollyhock, a strawberry-vine, a hop-vine, and two varieties of gladiolus. The elongation of each plant was measured three times a day—at 6 A.M., at noon, and at 6 P.M. At each time of observation the general atmospheric conditions and the state of the thermometer were noted. The result of the observations thus made upon six different plants is that, with very few exceptions, the growth between 6 P.M. and 6 A.M. was much greater than between 6 A.M. and 6 P.M. In many instances the elongation of the shoots during the night was double or triple that during the day. M. Duchartre offers at present no explanation of these phenomena, and does not venture to affirm that what was true of his six plants in the month of August is true of all plants at all seasons and in all stages of vegetation. He calls attention to facts which must be multiplied before any general conclusions can be based upon them, and he urges all persons in condition to prosecute such researches to accumulate observations for the elucidation of the law of diurnal and nocturnal growth.

Gases in Plants.—MM. Faivre and Dupré have sent to the French Academy a memoir on the gaseous mixtures contained in the roots and branches of the grape-vine and mulberry at different seasons of the year. We tabulate their results with the mulberry:

March, 1865, from branches (vegetation not begun),	Oxygen,	21	per cent.
May 15, 1865, from branches (vegetation active),	Oxygen,	13.3	"
	Carbonic acid,	3.3	"
June 16, 1865, from fresh shoots (vegetation very active),	Oxygen,	2.5	"
	Carbonic acid,	15.7	"
July 2, 1865, from shoots two years old,	Oxygen,	10.2	"
	Carbonic acid,	6.3	"
Aug. 17, 1865, from shoots of the year,	Oxygen,	10.7	"
	Carbonic acid,	9.	"
Oct. 15, 1865, from branches of the year,	Oxygen,	13.9	"
	Carbonic acid,	3.2	"
Nov. 17, 1865, from branches of the year,	Oxygen,	13.1	"
	Carbonic acid,	3.8	"
Jan. 31, 1866, from branches (no vegetation),	Oxygen,	20.9	"
	Carbonic acid,	0.01	"
July 7, 1866, from roots,	Oxygen,	1.9	"
	Carbonic acid,	14.6	"
Oct. 15, 1866, from roots,	Oxygen,	7.5	"
	Carbonic acid,	3.7	"
Nov. 24, 1866, from roots (leaves fallen),	Oxygen,	16.6	"
	Carbonic acid,	1.6	"

These and the analogous facts lead to the following conclusions: The presence of gaseous mixtures in the branches and roots of the mulberry and grape-vine is normal and constant. These mixtures consist of oxygen, carbonic acid, and nitrogen. The proportions of oxygen and carbonic acid vary greatly with the state of vegetation; when vegetation is inactive, but little carbonic acid is present, and the gaseous mixture within the plant has the same composition as the air outside of it; when vegetation is active, the proportion of carbonic acid is greatly increased and that of oxygen diminished. In the roots there is, at the same period, more carbonic acid and less oxygen than in the branches.

EDUCATIONAL.

When our fathers were in college, the public table at which all the students were required to take their meals was prolific in trouble. "Bread and Butter Rebellions" succeeded one another with almost as much regularity as the fruits in their season. Poor food, bad cooking, and no choice but Hobson's choice of horses, "Take this or go without," led to constant quarrels between the students and the faculty, in which, according to the judgment of the latter, the complainants were always wrong and the steward was always right. In time "commons" disappeared in almost every college, and for a quarter of a century private boarding-houses and dinner clubs have provided "rations" according to the taste or purse of each student. Thus the only remaining traces of that English institution, the college hall, with its well-served roasts of beef and mutton, have been the occasional public dinners at Commencement and other festive times, with the "tongue" and "pie," *horresco referens*, on which the academic appetites have been regaled. But now a curious change is in progress. "Commons" are coming back not with all the objectionable features of the old régime, but in a sensible form which gives general satisfaction. The authorities of our oldest colleges are providing halls and table furniture, making purchases of provisions and of fuel at wholesale prices, and offering board to students at prices much lower than it can be obtained for in the private clubs. A committee of those students who come to the common table is chosen to superintend its management and suggest improvements. The actual expense of the establishment is divided up in equal proportions among those who share in the advantages. None are required to come to the college table; any one may. Thus many of the benefits of a college dining hall are secured and most of the evils are avoided. Good board at low prices is secured, and a wholesome check is put upon the exorbitance of private boarding-houses. Harvard, we believe, is entitled to the credit of devising this new fashion. The experiment has there been tried so thoroughly that it is no longer an experiment. It is a success. Perhaps two hundred students voluntarily avail themselves of the proffered privilege. Not only do they receive board at a low rate, but the price of board in other places is decidedly lessened. Yale College is following the example of Harvard. A college boarding

house has just been opened on the plan we have indicated and is very popular. Other colleges are likely to pursue a similar course. By and by we expect to see the college "buttery" or "butlery" re-established—a plain refreshment room from which the students may procure their breakfast and tea at reasonable rates. Some place within the college walls from which the occasional invalids may be served, and to which the belated and the busy may resort, would be very popular. Many persons, indeed, if the fashion were once introduced, would like, as a general rule, the European way of breakfasting in one's room and dining at a public table. It is both economical and convenient.

—New Jersey has just established a State Board of Education similar to that which was organized last year in Connecticut, and to that which for a long while has worked admirably in Massachusetts. The governor and five other state officers, together with the trustees and principal of the State Normal School, constitute a board on whom devolves the superintendence of public instruction. Their agent is a secretary, elected by the board for three years. A similar arrangement will probably in time be adopted in most of the Northern States. It is a great improvement on the plan of entrusting to a single officer, unsupported by an advisory board, so grave a responsibility as the control of the public schools.

CITOYENNE JACQUELINE.*

This novel seems to us to deserve cordial praise for the good thing that it is, and, especially if the author is young, cordial encouragement for the other good things that it promises. It shows the marks of a clear and lively intellect, sound and kind feeling, the noble power of admiring and representing noble characters, much reading and, as we think, inherent mental elegance; for most of the superficial blemishes on which we are presently to have mercy tempered with justice, probably come quite as much of the presence of haste as of the absence of taste.

The story, beginning with "the early summer of 1792," and running through a period of about two years, follows pretty closely the history of the times in poor revolutionary France. But it has a private moral of its own, teaching how errors in youth—even the fearful error of a rash and ill-assorted marriage, like that of the pretty little heroine—may be lived down; and this is an excellent moral for all times, at least on this side of the millennium; for till then each new generation will fall into its young mistakes and need to be rescued from its young despairs. The plot is scarcely the strong point.

The best novelists may be divided into two classes. The first of these two is made up of the *stage-managers*. They bring before us characters which, complete in themselves, act themselves out most characteristically with and upon one another. The second is that of the *showmen*, who exhibit to us one by one fine specimens of humanity; though they may have no special aptitude at getting them together into any one cage to kiss, cuff, and kill each other consistently in a "Happy Family." In this latter class rather appears to us to be the place of our author.

Her figures, more or less minutely sketched, are apparently those of representative men and women, and distinct down to most of the smallest of them. La Sarte and her sons are each of them good in each of their ways. Bathilde de Roure is, in the main, sublime. It is hard to conceive of an embodiment of higher human heroism than is brought before us in this artless, serene, benign virgin sacrifice in the full fresh beauty of her youth, health, and holiness. We make her acquaintance, and take our leave of her, in twelve short pages; but it will be our own fault if we do not remember her for life. As we read on the other hand of Petronille de Croï, we are almost ready to go over to the modern apologetic school of historians and to declare that, if there were many aristocratic heads during the Reign of Terror so clad with baleful beauty and filled with unhallowed intelligence as hers, Robespierre and Marat were not without their excuses, and the Revolutionary guillotine was a more beneficent instrument than has commonly been supposed. *Monsieur* and *madame* are whimsical, here and there, to a degree which borders on caricature; but, perhaps, essential French nature is essentially unnatural and reached its climax at that most unnatural era.

The style can boast of that which, in the style of a work of this kind, is the merit of merits—vivacity. "C'è molto vita," as Horatio Greenough kindly said of the not otherwise altogether praiseworthy equestrian statue. In idiom, however, it is as the style of a native of Scotland and an inhabitant of France. Of course we take no exceptions at the introduction of Gallicisms into the speeches of Gallic mouths. This, judiciously managed, may have a very good effect. But, from carelessness, perhaps—perhaps from a desire to avoid the disfigurement of italics—the French words with which the pages are strewn are generally printed like English ones. Thus we read that "there was no concealing that he was a suspect." Further we have more than a little—and a very little would be too much—of what has been mildly entitled "the vile Scotticism of *would* for *should*," and its kindred vileness of *will* for *shall*. It becomes all good critics to set their faces, as so many flints, against this infectious taint of speech, which is fast creeping up over Mason and Dixon's line, and threatens to overspread our whole North. In a Celt or a Southerner it may pass for ignorance. In an English or *New English* man or woman it savors of the more unpardonable sin of affectation. At any rate, persons of sense and breeding, let them have the misfortune to be born where or what they may, *will* and *should* endeavor to avoid provincialisms. We object to the phrase "outward show," because, as well as the alas! too well-authorized one, "young girl," it implies an inconvenient antithesis. *Old* girl is impolite. Inward show is chimerical unless anatomical. "The whole three gentlemen" may perhaps be defended against the above accusation, on the ground that the complimentary idea of the three gentlemen in pieces is not, on the whole, inappropriate to the epoch; but, after all, the expression bears too strong a family likeness to that which Sir Walter Scott in his youth was taught better than to use, "the little two dogs." "Hard lines" is *slang*, and with no wit to justify its *slanginess*. "The prisoners were done with these demonstrations." People can *have* done with things; but can they possibly *be* done with them? "The messages I have been for you!" cries Citizen Pepin. He could have borne messages, done messages, told messages, or, perhaps, even made messages; but we must greatly doubt the correctness of his statement that he went messages. "Batch" is a word which belongs to a baker's shop. It is applicable properly to men only when exposed simultaneously to the very warmest weather or in a Caribbean kitchen. "Comparisons are odious," according to the proverb. Comparisons are comical, is the reflection that chiefly strikes us as we read such as that of Félicité to "a dove pouting." A dove pout! How could the creature do it? Not with its beak, surely! Perhaps like the young lady, perplexing to the infant understanding, in the nursery song, "Who pouts at her milk *with a toast of white bread*." The original sentence, notwithstanding, in its full severity is borne out by the likening twice over of the classic Adonis, Bertrand's teeth to the "kernel" of "a luscious fruit." It calls up a vision of artificial teeth of most inartificial construction—too similar, in short, to the mandibles of a parrot—surrounded by lips of the contour rather of Guinea than of Greece.

We have hardly room to add, as in candor we ought, that the author is unfortunate in the reviewer. To our mind, or order of minds, it is as difficult to lay hold, with a grasp firm and strong enough for discrimination, of anything which puts it *en rapport* with the French Revolution, as it is for our hand to lay hold in like manner of the conductor of a charged electrical machine, and difficult for the same reason: it is too shocking. Those, notwithstanding, who, not sharing our idiosyncrasy, found a feast in "A Tale of Two Cities" and the French episode of "My Lady Ludlow," may look for their dessert to this remarkably spirited new story, and not look in vain.

HOLE'S BIOGRAPHICAL DICTIONARY REVISED.*

In an early number of The Nation we reviewed the original merits and defects of this useful little manual. The American editor has endeavored to enhance the former and to diminish the latter by inserting many hundreds of American names, some no less important than Arnold, Burr, or Choate, and others of less note, but desirable in a work designed for circulation in this country; by adding "a large number of European names of undoubted importance which the English editor had omitted, and which one would naturally expect to find in a work of this sort, as, for example, Abraham-a-Santa-Clara, Banim, Chlopicki, De Wette," etc.; by supplying missing dates, and correcting or verifying others; by "rectifying some grave mistakes and some hardly less grievous inconsistencies" of orthography; by supplying accents in the French, German, and other Continental names; and by incorporating the supplementary names of the second English edition. Another less useful feature of the American reprint is the omission, in the dates, of the month and day attached in the original issue to the year of death.

We are glad to find that these changes have remedied many of the defects pointed out in our review. Thus we no longer look in vain (as we

* "A Brief Biographical Dictionary. Compiled and arranged by the Rev. Charles Hole, B.A., Trinity College, Cambridge; with Additions and Corrections by William A. Wheeler, M.A., etc." New York: Hurd & Houghton. 1866.

complained) for such American names as "Hancock, Otis, Montgomery, Arnold, Sumpter, Marion, Mercer, Randolph, Benton, Douglas, Perry, John Brown, Foote, Kearney, or Reno;" for "Czarnecki, Kochanowski, Chlopicki, Skrzynecki, and Dembinski;" for "Damjanics, Nagy Sándor, Csányi, and Széchenyi;" "Leopardi, Colletta, Bandiera;" "Schill, Sand, Hebel, Immermann, and Lenau;" "Czerny George and Milosh;" or for "Moses, Joshua, Isaiah, Jeremiah, Ezra, and Nehemiah." Foreign names, being now accented, have ceased to look so very awkward as we formerly found "D'Estrees, Fenelon, Stael, Cambaceres, Arpad, Kolcsey, Blucher, Muller," etc. Even the termination of Russian names has been corrected in some of the cases quoted by us, and thereby made more uniform. The dates which we pointed out as erroneous under "Nicholas and Frederic William IV." have been altered.

Let it not be supposed that we claim for ourselves the merit of all these useful additions and alterations. By no means. On the contrary, we have good reasons for believing that the American editor has not seen our review at all (though we know it to have been in the hands of the American publishers as early as last November), and that in most of his additions and corrections he has strictly followed the "New American Cyclopædia;" at least we infer as much by comparing the orthography of the new, and chiefly of the Christian, names, which, deviating from the general plan of his work, he in many cases gives in their foreign form, precisely as given in the "Cyclopædia," and by noticing the large number of omissions, errors, and contradictions mentioned in our review, which he has failed to supply or correct. Thus we still look in vain for the names of Bocskai, Gen. Dampierre, Decazes, Dwernicki, Fieschi (the regicide, the name of the Genoese conspirator ought to be Fiesco), King John Zápolya, Luzzato, Moses-ben-Ezra, Odysseus, Solomon-ben-Meir, Wessely, or Zolkiewski (almost all of which are to be found in the "New American Cyclopædia" only under comprehensive historical or literary heads), while, as we stated, others incomparably less important are given. French surnames attached to non-French royal names, as *Le Bégue, Le Bon, Le Chuman, Le Posthume,* are retained, while the surnames of many French kings "are given in English, as *the Bald, the Fat, the Fair, the Wise*" (see the Michaels, Ladislases, and Charleses). Most of the single errors pointed out by us remain uncorrected, and we still find repetitions as well as discrepancies under such heads as "Cosmo" and "Medici," "De Gerando" and "Gerando," "D'Herbelot" and "Herbelot," "Leonardo da Vinci" and "Vinci," "Judas Maccabæus" and "Maccabæus."

By thus comparing the work as it now is with our observations on the original edition, we believe that we have best shown what the American editor has done and what he has failed to do. As formerly, so now, we have shown but specimens. Some new errors have occurred in the revision itself. Thus we find an incorrect "Messaros, Lazarus" in the appendix, and, besides, a correct "Mészáros, Lazarus" inserted in the body of the work, after the "New American Cyclopædia;" a correct "Vörösmarty, Michael" added to the incorrect "Voeroesmarty, Michael" of the original edition; and the Christian name of the newly-added Zrinyi, the hero, in Hungarian—Miklós—as in the "Cyclopædia," while that of the poet is left as it was, in English—Nicholas. Gen. A. S. Webb, mentioned in the appendix as deceased in 1864, was not killed at the battle of the Wilderness, as at first reported.

But in spite of these and other imperfections, which are not wanting, we must regard this revised little dictionary as a very valuable addition to the list of American reprints.

Only a Woman's Heart. By Ada Clare. (M. Doolady, N. Y.)—It is impossible for the novelist so to mispaint life that something of truth will not shine from the canvas. His readers can sometimes discover all the better through his exaggerations what is the fashion of the day in sentimentalism, or heroes and heroines; what the most "telling" virtue; what the popular aim in life. And this is a knowledge that no one who desires to understand his kind can afford to forego, and the obtaining of which, withal, is the sole justification a sensible person can have in reading "Only a Woman's Heart." It is a story the most singularly absurd, theatrical, often positively coarse, and inspired by a moral sentiment better calculated to "bring down the house" than to hold up an example; and yet containing some "hits" so clever and some sketchings of character so bold and so nearly unique that the reader is perplexed with the strange inconsistency, and is ashamed to be interested where he is so frequently shocked.

The heroine of the story is the daughter of a country "hotel" keeper. She believes in muscularity, as if she were one of Kingsley's own model men. She thrashes her schoolmates, has an enormous appetite, can shoulder a piece of furniture in a way that would make her fortune in New York on the first of May, is a remarkable mathematician, and in bearing is moody and eccentric, like many another girl of fifteen. The first pictures of Laura Milsland are, on the whole, striking. The reader becomes interested and is led on to where she very naturally falls in love with a languid but talented actor who happens to be wasting his summer vacation in her neighborhood, and pays her attention to amuse himself. Here the story becomes marred by conversations that fall infinitely below the descriptions. The entire colloquial part of the book, it may be remarked in passing, is beneath criticism, vibrating as it does between the melodramatic and the painfully unrefined.

Laura loves for once and for all. Not so the handsome Victor Doria; "four he loves with all his heart, and five he casts away," as the apple-seed legend hath it. He leaves the "hotel" for New York and Europe, and achieves a success not more complete on the stage than in the drawing-room, where, as the author remarks, being accustomed to the antagonism of jealous papas, he learns to consider frigidity "the normal state of the paternal parent." Laura's father in the meantime strikes—mineral-water on his estate, makes his fortune, and is prevailed upon by his daughters to carry them to the city. Here in New York the author expands to her native air, and we feel that we are reading truth and nature at last—the nature of Fifth Avenue, Mme. Demorest, the Booth matinées, the new bonnets. Here we are forced to behold the inner life of some of those inexplicable, gorgeously-dressed promenaders, indigenous only to Broadway; to dream with them their dreams colored with Bengal lights, smelling of patchouly, feeling of kid gloves, sounding of stage elocution with a touch of mad cab driver, tasting of *recherché* suppers at the Maison Dorée. Our precious Laura is made the embodiment of such romancing. On her arrival in New York she has an interview with a long-estranged uncle. Her simplicity—modelled, say, after Maggie Mitchell's *Fanchon*—wins him at once, and he leaves her all his money at his death, which shortly after occurs. Possessing ample means, she pursues Demorest with frantic expenditures, for the sole purpose of rendering herself attractive in Victor's eyes. She attends to her physical culture in every possible way, and the "ugly duck" becomes a beautiful swan ere Victor makes his second appearance. Several minute descriptions of her toilettes are introduced in a funny parenthetical sort of way, even in the midst of some exciting scene; the very buttons on her shoes are mentioned—they are pink coral, or turquoise, or whatever matches the jewelry she happens to be wearing. On Victor's return, Laura requests an interview with him, in which she lays her heart fully open to him in a set speech. The analysis of the highly-wrought and melodramatic scene which follows is so far beyond the scene itself in merit that it seems marvellous that the person who wrote the one could perpetrate the other. Victor repels her, and now tragedy sets in in real earnest. All sorts of trials are heaped upon her. In the language of the author, "she was tossed about in whirlwinds, dragged through storms, immersed in desert seas, brought to that extreme of doubt when nothing seemed to have any reality but evil and pain and malignant exultation in pain." As the reader once found Laura like Maggie Mitchell, he will now discover in her a resemblance to Lucille Western, and also to the young lady who goes to all the Booth matinées, and who is always passing bouquets with little notes dangling to them over the footlights to the fascinating tragedian, while her name circulates among the gossipping boxes. Here the reader, who prides himself on his familiarity with polite literature, may ejaculate "yellow-covered!" "sensational bosh!" and the like. Then he will reflect that there may possibly be other phases of life than those with which he is acquainted; that the *true* experience of a woman who, like Laura, has passed her existence in the atmosphere of a false, showy, mediocre society, will be likely to be *truly* false and showy and ill-bred; that the rendition of such truth would be impossible to many a better historian than Laura's; and, finally, that it is both an instructive and interesting thing to learn how much wild force and passion and aspiration, tinged with a continually haunting consciousness of a higher life, can burn under the *émail de Paris* which blooms every night in metropolitan theatres. He will resume his reading. He will come to Laura as Miss Bateman. With a covert mortification he finds he cannot resist following the hero and heroine through their stages of convergence, in the closing chapters, till at last, happily united, they perish in each other's arms on the occasion of a shipwreck—a shipwreck got up just as real and beautiful as the one in "L'Africaine."

We close by giving the author's own analysis of her heroine, which, like all her analyses of character, is better than her development of it: "Laura's life was like the expressed juice of the grape, which begins with a sickly insipidity, ferments through all manner of harsh, violent crudities, till, with its own tumults, it casts away its impurities, and mellows itself into the rich ambrosial wine."

Patriotic Eloquence. Being Selections from One Hundred Years of National Literature. Compiled for the use of schools in reading and speaking. By Mrs. C. M. Kirkland. (Charles Scribner & Co., New York.)—It is customary for most of the "speakers" which are prepared for school-boy declamation to select from the literature of former times as well as the present, and some will be found quite exclusively American in their contents; but Mrs. Kirkland's plan is, so far as we remember, unique. Her object was first to foster the sentiment of patriotism in the young by familiarizing them with the words and great deeds of the founders of our government; next, to preserve such specimens of eloquence or national devotion as were in danger of falling into oblivion; and lastly, by giving a chronological sequence to the whole, to make it an aid in the study of our history. In carrying out her design, she had the good sense to make her selections brief, for which she ought to be gratefully remembered by all schoolmasters. With a proper feeling, also, she introduced the speeches of those Englishmen who defend the cause of the colonies in Parliament, such as Chatham, Burke, Barré, and others not unfamiliar already to the lips of our youthful orators. Many pieces, of course, are repeated in this collection which, if freshness alone had been consulted, might have been omitted. Mrs. Child's imaginary speech of James Otis, and that which Webster put into the mouth of the elder Adams, are deservedly retained. "Hail Columbia" and the "Star-Spangled Banner" look somewhat oddly; Washington's Farewell Address less so. The last eighty pages of the book have been compiled, by another

hand, from the poetry, speeches, and documents of the rebellion. The order of dates is preserved, but in other respects the choice is not striking. President Lincoln's Gettysburg speech outshines all that goes before and follows after it. President Johnson makes as good an appearance as he can, in extracts from his first annual message.

Devotions of the Ages. By Rev. N. G. Allen. (Philadelphia: J. B. Lippincott & Co., 1866.)—This book is prepared by an Episcopal clergyman for the use of members of that communion. Its plan is to give the collect for every Sunday and holy day in the year, and then, following the collect and harmonizing with it in sentiment, a sentence or two culled from the epistle or gospel of the day. Last comes a short passage from some one of the poets, by which it is intended to fix Scripture and collect in the reader's memory. The editor's work, we think, has been best done where his liberty of selection was least. But the book was not meant for the literary world. By those for whose use and enjoyment it was compiled, it will, no doubt, be found pleasing as well as serviceable. Certainly, though, it ought not to minister to the enjoyment of any one to find a book of *devotions* ushered in by disputatious remarks on the universal bishopric or on any subject of controversy. A rather flowery preface is furnished by Bishop Clark, of Rhode Island, and externally the volume is a very neat one.

HOW THEY WORK AT A GERMAN UNIVERSITY.

BERLIN, May 12, 1866.

THE chief pride and ornament of Berlin, next after her museum, is the university. The indefatigable industry and minuteness with which the Germans collect and dispense all the knowledges of earth receive here their best illustration. The range of subjects that are treated daily, the amount of illustrative material that has been collected in its cabinets, and the accuracy and voluminousness of the information that is given are wonderful. In the present semester—extending from April 9 to August 15—there will be given three hundred and thirty-five courses of lectures, all of them occupying the whole semester and employing one hundred and eighty-three professors. A majority of these lectures are two hours in length, some of them three, and they are given at all hours of the day, from six in the morning until ten at night. Forty-eight of these courses are given gratis.

The length of time that some of the professors occupy continuously is amazing. Professor E. R. Schneider lectures once a week on iron and its related metals from six to seven in the morning, and six days in the week he personally superintends the work in the laboratory from eight to twelve and from two to six. Professor A. Baeyer demonstrates practical chemistry six days in the week from eight to four continuously, and, what is more, does it *gratis*. Surely only the German character is equal to the labor of such a "solid day" as this.

The number of subjects treated is also remarkable. In the department of philosophy, for instance, and on the single subject of history, there are twenty-nine simultaneous courses, and a greater number on mathematics. In the theological department there are ten courses on as many different books of the Bible. There is a series of lectures given on the Arabic and Turkish languages "to those who have already attained some knowledge of them and who wish to speak them with a view to becoming ambassadors, consuls, or interpreters in the East." There are three lectures a week "on the art and implements of ploughing;" one a week on the salubrity of the climate of Italy; four on the socialistic doctrines of Fourier; and lectures on the philosophy of Buckle, on that of Lessing, Goethe, Herder, and Schiller.

The language of the Samaritans furnishes a subject for a regular course; there are three lectures weekly on the laws of syntax of the Arabic, and as many more on German, French, and English stenography. Dancing, the manual of arms, and the best modes of horseback riding have each a professor who gives them his whole attention.

The catalogue of this institution is a curious document. Never before have I seen so conclusive a demonstration that, to a German at least, *labor ipse voluptas*. Instead of giving, as we do in America, a list of the students attending the various departments, the authors of this singular book proceed to dissect the dialogues of L. Annæus Seneca, which dialogues, we are modestly informed, they have had under a course of "emendation" for the last eighteen months. This is the preface to the catalogue, and through nineteen pages of ponderous Latin they pursue the ghost of poor Seneca, demonstrating beyond a doubt that the old Roman could not write as good Latin as the rector and senate of the University of Berlin in the year of grace 1866.

Every foreigner who seeks to enter the university must bring testimonials, from natives of his own country, of an unexceptionable character. Nothing further is required except that he be of a proper age. Upon matriculation, without which he cannot hear the lectures, he pays three dollars: one for his certificate, one for the use of the library, and a third to the dean of the faculty under which he studies. A change from one faculty to another can be made only at the end or beginning of a semester, but no new matriculation fee is expected. The rules of the university strictly prohibit all students from duelling and from establishing secret societies—two tendencies which, in the German student, as the latter in the American, are very strong. Notwithstanding the laws of the university so rigidly forbid the formation of these secret fraternities, and the rector and senate keep so vigilant a lookout for them, yet I am informed that they still exist and hold weekly meetings. There is one sodality, however, that is not at all interfered with, since it has as its professed object, its fraternal cement, so to speak, the critical analysis of the text of Thucydides. This is a sort of social mortar that to American students, at least, would appear to be of the least possible cohesive power; the Germans, however, moisten the analysis well with the best quality of Happold's Bavarian beer.

The modes of punishment are various, including the *consilium abeundi* and expulsion, but it is supposed that all who come here from abroad are able to govern themselves. The government of the university is very mild and based almost entirely on the student's sense of honor; there is one species of disgrace, though, that may be incurred by a foreigner as well as a Prussian, and that is that, in case he goes away without paying his term-dues, which are very small, his name is posted on a black-board kept in a public place for that purpose.

The whole amount of the university fees is exceedingly small. At the end of each semester, every student is expected to apply to his faculty for a certificate that he has attended the full course of the lectures he selected, for which he pays a dollar and a half. Before leaving the university finally he is required to procure a like certificate as to his general conduct from the rector, for which he pays two dollars and a half. Having paid these small dues, the student may honorably leave the university. If he chooses to go higher and apply for a degree, he must incur a much larger expense. In theology and philosophy there are two degrees, licentiate and doctor; in law and medicine only the latter. A licentiate's degree costs fifty thalers in gold (about the same number of dollars in greenbacks), and the doctor's degree one hundred thalers in gold.

To obtain the licentiate's degree, it is requisite that the applicant shall have studied three years in some university, of which he must produce proper testimonials and a certificate of character. He is then thoroughly examined by a committee of the faculty, under the supervision of the dean, either by written thesis or oral disputation, and a vote is taken upon his approval or rejection. To obtain the doctor's degree the candidate must, in addition to the examination, present a printed dissertation in Latin written by himself, and defend it orally in Latin in an open disputation. If the candidate is also a candidate for a professorship in the university, then he must conduct the disputation against at least three opponents, chosen by the faculty. If successful, the doctor's oath is administered to him by the secretary of the university, and he is solemnly inducted into his degree.

Many of the professors in the university teach privately, which they are permitted by the faculty to do only after having received the licentiate's or doctor's degree, either for compensation or without, as they themselves elect. Some do this as their principal or only means of obtaining a livelihood; others gratis, from a pure love of science, having otherwise a sufficient support.

Closely allied to the university is the Academy of Art—both of them noble buildings. Let me mention the prizes that are soon to be awarded in the latter institution. It is founded on a royal endowment and has its prescribed course of study, and to all who have completed that course or one equivalent to it elsewhere the King opens the following prize: It consists of a yearly pension of seven hundred and fifty thalers for three years, to be given on condition that the successful competitor shall spend the last of the three years in Italy on an artist's tour. The only other conditions precedent are that the competitors must be under thirty years of age and that the picture shall be of a given size. In addition to this a private person named Beerisch has established two prize foundations as follows: the first prize consists of seven hundred and fifty thalers for one year, and is given on condition that the recipient spend eight months in Italy and leave his picture six months in the academy. Candidates must be over twenty-two and under thirty, and must have studied in a German academy. They are to paint one landscape of a certain size illustrating a vintage festival and several others on subjects of their own selection. Each competitor must make an affidavit that he belongs to the Jewish faith and that the pictures are wholly his own. The second prize is the same, and on the same conditions, except that pertaining to religion. The subject of the main piece is to be taken from the Book of Genesis, xlvi. 29. The time given for the execution is from January 25 to July 14. Foreigners can take only a prize of honor.

S. P.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

THE HOUR RULE AND THE PREVIOUS QUESTION.

In July, 1841, the House of Representatives voted by an immense majority to limit the time allowed each speaker to one hour. This rule, hitherto without a parallel in the history of legislative assemblies, was adopted at a time when the great reaction of 1840 had given to the Whig party a power in the councils of the nation which it had never had before and never after had again. Its members, impatient of discussion, or of anything which threatened the success of the measures for which they had long been struggling, were found willing or were persuaded to place upon their own debates a restriction which arbitrary authority, dreading, as it does, freedom and fulness of deliberation, has never ventured to impose upon a representative body. Party drill and the influence of Henry Clay drove through the House a measure which the great Whig leader was unable to force through the Senate. There, the opponents of the hour rule were determined, if Benton's statements are to be relied on, to resist its enforcement, if necessary, by violence; but its passage, though once or twice threatened, was never attempted. Efforts have since been put forth to abolish it in the House, but to no purpose; though at one time a motion to that effect, made by William Porcher Miles, of South Carolina, came within nine votes of being successful. But there is now little hope of its ever being changed until juster notions prevail of the nature of deliberative bodies and of the rights of constituencies; for it flatters mediocrity by placing great and mean abilities upon the same level and under the same restrictions, and it pleases majorities by enabling them to pass their measures, comparatively speaking, unchallenged and unscrutinized.

But this was not enough. The hour rule only stifled debate; it did not quite kill it. Its complement was soon found in the previous question, which, up to that time, had been but little used in the proceedings of Congress, and which, outside of the United States, is now scarcely known in any representative body in the world, and even when employed is never moved save under very peculiar circumstances or in questions of a very peculiar character. To these two parliamentary monstrosities we owe the greater part of that hasty and ill-considered legislation which has of late so often disgraced our statute-books, both state and national, and in so many cases brought discredit upon the proceedings of Congress and the minor legislatures.

Twenty-five years have gone by since the hour rule was adopted. They have been to us twenty-five years of unparalleled interest and excitement, disturbed by the agitation of some of the gravest subjects that ever stirred the heart or tasked the mind of man, and crowded with the grandest events that ever marked the progress of civilization. The press, the pulpit, and the platform have all alike been active. For the first time in its history the nation found itself divided on a sharply-defined question of morals and humanity, in which appeals were constantly made to everything that was earnest in conviction and purpose, to everything that was profound in reasoning, to everything that was generous in impulse or lofty in feeling. Rude men felt the ennobling inspiration of a great cause. Men of letters for awhile laid aside the dilettanteism of scholarship in the struggle to re-establish the government upon higher and purer principles; and forgot the deeds of Cicero and the dreams of Plato to found a second time a republic greater than Cicero ever knew and nobler than Plato ever dreamed. During that long period of unrest, of strife, of intense moral and intellectual activity, there have been many able men, many leaders of public opinion, in the House of Representatives; but its records will be searched in vain for one speech delivered there which has of itself exerted an appreciable influence in bringing about the result which we have reached. Exhaustive argument upon any subject or upon any portion of an important subject there could not be in the time allotted; and necessarily not that highest kind of eloquence, begotten of great debates, when argument heated and fused, so to speak, by passion crystallizes into words and sentences which become the enduring riches of the race. No speech can be found there which will be cherished by the men of after ages as a memorial of the great political battle their fathers fought; no speech which will thrill the hearts and rouse the efforts of the lovers of liberty in other lands and other times, when the passions that prompted it shall have been forgotten. Page after page is taken up with essays precisely alike in length, precisely alike in the total lack of interest to all save curious enquirers, and of which, except by them, not one sentence will ever be read, not one will ever be remembered, not one will ever be quoted. It is a dreary intellectual desert, stretching over a quarter of a century, in which the wearied traveller is not only never refreshed by the oasis of a great debate, but fails even to be cheated by the mirage of a possible one. It is all *vox et prœterea nihil.*

But it is not simply that in the House of Representatives debate no longer flowers into eloquence; debate itself is dead. Congressmen speak no more; they read. Discussion has given way to the prepared essay, painfully written for a painful delivery. The highest ambition of the members is to produce something which will be subscribed for and circulated as a campaign document. The people look to them no longer for those impassioned utterances which educate the public mind, for those exhaustive arguments which furnish to the rank and file of a party the material for carrying on great political contests. Under the hour rule and the gag-law of the previous question the House is every year assuming more and more the character of a body created and meeting together simply to give authority to the reports of its committees. It is in these secret bodies, whose proceedings are rarely, if ever, made known, that the arguments for and the arguments against proposed measures are urged at length, and that laws are made. And even when their conclusions are rejected, they are rejected for reasons which the public learns not from the speeches of those who opposed their adoption, but from the telegrams and correspondence of the daily papers.

The great and in fact the only argument used in defence of the hour rule and the previous question is that a man ought to be able to say in an hour all that is necessary to be said upon a given subject; that the people ask for results, not for discussions; and that even now there is still too much talk and too little action. As those who sincerely believe this argument judge their fellow-creatures by themselves, their position is not so much to be wondered at. Certain it is that if the ability of our legislators does not exceed that of the men who defend in this manner these outrages upon the freedom of debate, no conceivable amount of quiescence on their part will either injure materially their own reputation or interfere with the national well-being.

But the argument is apt to catch the unwary and unreflecting; for, though no man thinks that he himself talks too much, he is always inclined to believe that his neighbor does. Yet it is untrue in each one of its particulars. There are too many measures and too little discussion; the people do not ask for results simply, but for the results of thorough deliberation; and no man who is fit to be a member of the national legislature can express himself fully upon any subject of great national concern in the space of an hour. The action of deliberative bodies without talk causes far more mischief than their talk without action. Representatives meet to discuss, and, of the two evils, the maximum of debate with the minimum of legislation is infinitely preferable to the minimum of debate with the maximum of legislation. There is always more danger to mankind of being governed too much than of not being governed enough. It is doubtless an evil that men will persist in talking who have nothing to say; whose speeches, as Garret Davis so truly said of his own, are like an October rain, refreshing nothing, fertilizing nothing, only prophetic of the dreary storms of the same kind that are to follow; and this with us is much more an evil than elsewhere, since our assemblies, unlike those of other countries, have too little independence or too much tenderness of feeling to exercise that natural right, inherent in all deliberative bodies, of putting down the member who talks merely to take up time. But it is, unfortunately, an evil inseparable from law-making, and that is not a philosophic course which, to escape a temporary inconvenience belonging to all debate, prefers to sacrifice debate itself. It is far better that weak men should talk, should talk often, and should talk long, than that

able men should not talk at all, or should try to say in an hour what cannot be properly said in a day. It is far better that the representative should be bored by a long speech than that the constituency should suffer under a bad law. No advocate would undertake a cause where life was at stake or where great interests of property or of reputation were involved, were he to be limited in summing up his case to an hour. And yet we expect members of Congress to discuss and settle in that time grave measures of public policy, the adoption or the rejection of which will leave its impress upon the national life and character for generations. And the evil is increasing. It is not infrequently the case in our State legislatures, at the close of the session, that speeches are limited to five or ten minutes. And the national House of Representatives has, within a few days, exhibited the discreditable proceeding of allowing its members to speak but half an hour upon a constitutional amendment designed to affect the fate of eleven States, the rights, including that of suffrage, of eight millions of people, and the future character of the whole Republic. Under the pressure of the previous question, a clause was carried through, by an overwhelming vote, to which a large minority, if not an actual majority, of the members were opposed. If speedy action was the only thing aimed at, it would have been far more like it, and far less of a farce, to have moved the previous question as soon as the report was read.

It is a grave question whether any legislative body can lawfully suppress in this manner freedom of discussion, and whether irresponsible majorities can thus deprive constituencies of their natural right to have their views represented. Certainly, if the power exists to limit speeches to one hour, it also exists to limit them to one minute; and the time may yet come when minorities will be denied the privilege of debate in all cases, as they are now occasionally denied it in some. The evil will then work its own cure. For it is not by hour rules and previous questions that the people can be brought to sanction great principles of public policy. Representatives may shirk or refuse the discussion of the measures before them; but if these are not examined in their proper place they will be examined somewhere else. Mr. Stevens complains that the people are not up to his standard of abstract right; that he is forced to accept measures with which he is not satisfied, simply because they are the best he can get; yet the people read diligently the reports of Congressional proceedings, and might be led to adopt his extremest views if he ever cared to inform them of the reasons upon which they are founded. Indeed, if liberty of discussion is, as Macaulay says, the safeguard of all other liberties, the Union party can, least of any, afford to abridge it in the slightest particular; for it has been and is the very breath of its life. It can find no faster means of gaining strength than by allowing in both houses of Congress the freest and fullest debate upon all important measures it designs to pass. There the arguments in favor can be clearliest stated. There the arguments against can be best met and answered. But no legislative body can be expected to shun that besetting sin of all majorities, the passing of measures without giving time for deliberation, so long as these two gross violations of the liberty of discussion are embodied in our parliamentary law. The doctrines of human rights cannot so soon become incarnated in our institutions and our public policy while Congress denies one of their highest rights to its own members; and he would hasten forward the coming of that time when in this land all men shall be equal before the law in fact as well as in theory who should effect in our national legislature the abolition of the hour rule and the restriction of the previous question to its proper use in those matters only which affect personal character.

THE SUSPENSION OF THE BANK ACT IN ENGLAND.

The impression is very general, both in this country and in Continental Europe, that the "suspension of the Bank Act," as it is commonly called, means the suspension of specie payments by the Bank of England. If this were so, the credit of England would stand on a rather precarious footing, since the event thus construed has happened three times within twenty years, and is destined to recur periodically every ten years as long as the act remains in force. But in fact this interpretation of the occurrence is entirely false. All that is suspended is a restriction upon the issues of the bank, imposed by its new charter in 1844, and ostensibly invented by a very conceited and very wealthy banker, Jones Lloyd, who was made a peer under the title of Lord Overstone. The proposition was accepted by Sir Robert Peel, who announced it as an infallible preventive of panic and disaster for the future. It has in practice shown itself to be the very parent of commercial panics.

By the act of 1844 the Bank of England is divided into two departments, one of issue and the other of banking, each as absolutely independent of the other as if they were separate banks. The issue department may issue notes to the extent of a fixed and invariable amount of Government securities held in its vaults, in round numbers $75,000,000. Every pound beyond this must be represented by an equivalent in gold held in *that department*. As only a few private banks are allowed to issue notes at all and these issues are restricted to a fixed sum in the aggregate, which is diminished constantly by various causes, the result is that with an enormous increase of business, there has been a slight decrease in the amount of bank-notes in circulation in England, except so far as those notes have been issued on the basis of gold coin actually held by the issue department of the Bank of England to a like amount.

The banking department is conducted upon principles similar to those of any other bank of discount and deposit. But it must be observed that the issue department might have millions of gold in its vaults, and yet the banking department be unable to meet the smallest check of a depositor. Such was in fact the condition of the bank at the last advices. The cash in that department is reported to be reduced to $150,000, a sum which any one of fifty depositors could instantly draw out. The issue department at the same time held over $60,000,000 in gold, not a penny of which could, under the law, be applied to the relief of the banking department.

The suspension of this restriction will therefore be easily seen to be a measure very different from suspending specie payment, but it is also the only means of avoiding the latter contingency. In times of panic there is no other place of discount available besides the Bank of England, and if it should peremptorily refuse to discount on any terms, a majority of the bankers and merchants of England would have to suspend in a week's time. Now, if the act of 1844 were inflexibly maintained, the bank would not dare to discount a bill or lend money upon any security whatever, or at any rate, after its reserves of cash in the banking department were reduced to a certain point. For if it continued to lend as it has done this month, it would have not a shilling left to pay its depositors. But if it refused thus to discount, its private depositors, one-third of whom would be ruined, would either from necessity or revenge withdraw their deposits, and thus speedily reduce it to a suspension not merely of cash payment, but of *any* kind of payment. When this occurred in the banking department, as it infallibly would occur if the restrictions of the charter were maintained to the end, is it conceivable that the issue department could avoid a run for gold? Would the holders of its notes believe that one side of the bank was solvent when the other side had gone into the Court of Bankruptcy? It is absurd to suppose it. A run would be inevitable, and the suspension of specie payments upon the notes would be equally inevitable, since $75,000,000 of them are issued upon stocks, which at such a crisis would be utterly unsalable.

It was in consequence of these considerations that the Government acted in 1847, 1857, and 1866. All that was done was to allow the banking department to relieve itself at the expense of the issue department, by borrowing gold from the latter without diminishing the issue of notes, or, which is the same in effect, issuing more notes without getting in more gold. The mere announcement of this permission stopped the panic in 1847, and the liberty given was never really used. People who were hoarding money in the expectation that all loans would soon cease, loosed their hold as soon as they found that the fetters were removed. In 1857 the bank was forced to use its privilege to the extent of $10,000,000. In the present crisis the bank has thus far got along without availing itself of the privilege offered, but has ventured to reduce its reserves to a point which leaves it at the mercy of its depositors.

The policy of such a restriction must, of course, be the subject of

much dispute. It is a source of frequent profit to those who are enormously wealthy and uncommonly shrewd, inasmuch as it compels frequent advances in the rate of interest to high figures. The London *Times*, which is devoted to the cause of these immense money-lenders, steadfastly adheres to the act of 1844, and insists that it need not be suspended. Its arguments upon the last point are simply ludicrous. The *Daily News* is strongly opposed to the continuance of the act at all. Into this controversy, however, we shall not enter, our object being merely to explain the nature of the action taken by the British Government, and to clear up misapprehensions upon the subject.

NAPOLEON I.

TRANSLATED FROM THE FRENCH OF AUGUSTE BARBIER.

BY C. P. CRANCH.

O CORSICAN! how lovely was thy France,
When Messidor its shining days unrolled!
A steed untamed, and with rebellious glance,
Without a curb of steel or reins of gold.
A wild mare of a strong and rustic croup,
Still hot and steaming with the blood of kings:
Trampling the ancient soil—too proud to stoop—
Free for the first time as with new-found wings.
No hand had ever touched her with disgrace;
She bore no mark of insult or of blow;
On her large sides no man had dared to place
Saddle or harness of a foreign foe.
Her skin was bright—shapely her limbs and sound;
Her motions graceful—proud her eye and bright;
And when she reared aloft with sudden bound,
Her neighing filled the nations with affright.
But thou didst come, and, smitten by her grace,
Lay on her flowing mane thy hands of steel,
Impetuous Centaur! Stern was thy embrace,
Mounting upon her back with booted heel.
Then, as she loved the stirring battle-field,
The beating drum, the roaring cannon's blaze—
The whole earth for a race-course thou didst yield,
And war became the pastime of her days.
Then no more rest—no nights of slumber sweet;
Ever the open air and labor sore;
To crush down human forms with trampling feet,
And steep her legs and breast in human gore.
For fifteen years her hard hoofs in their course
Beat down the multitudes that crossed her path.
For fifteen years with foaming speed and force
She trampled on the nations in her wrath.
At last, when, weary of a vain career,
Tired of a course where in ambition's lust
The world was trod to clay, and far and near
The nations in her pathway raised like dust,—
Her limbs exhausted, panting—in her task
Ready to sink at every step, she turned,
A respite of her Corsican to ask—
Thy tyrant will her supplication spurned:
More closely thou didst press thy vigorous heel
Against her side—her piercing cries were hushed.
Within her foaming mouth the bit of steel
More fiercely set—until her teeth were crushed.
She rallied—but a day of battle came
When she could bite her curb no more, but reeled
Dying upon a bed of shot and flame,
And crushed thee with the shock upon that field!

CONCERNING DISINFECTANTS.

[FIRST ARTICLE.]

OF the composition and nature of malaria and miasms we are altogether ignorant. So far as the constitution of these malign influences is concerned, we know no more to-day than was known in the time of Aristotle. Of the real character, force, and disposition of the enemy we are uninformed; but in the matter of defence, several important items of knowledge have been gained by mankind. We are now not altogether powerless, as of old, to repel or avoid the advancing enemy. This is evinced clearly enough by the comparatively mild character of the pestilences which have occurred in Europe in modern times as contrasted with the frightful plagues of the Middle Ages.

The importance of cleanliness, both personal and civic, of temperance and tranquillity in resisting disease, is known and acknowledged, while the bad effects of filth, intemperance, excessive fatigue, and mental depression are equally well ascertained. The word cleanliness, in particular, here covers a wide ground. Holding fast the while to the dictates of common sense, every man and every citizen would do well to consider carefully the full meaning of the term. Cleanliness, once wisely comprehended, should be sought after assiduously and practised conscientiously, at whatever cost of time, trouble, or money.

If the practice of cleanliness could but be carried to its highest term; if all actual filth were immediately washed away from our houses; if all prospective or potential filth were immediately carted away; and if, thanks to some efficient system of ventilation, all foul, vitiated, or spent airs were removed from our presence at the instant of their formation, there would be comparatively little need of disinfectants—taking the word in its ordinary sense. There are no more potent destroyers of unclean matter than the great purifying agents which have been provided by nature. We are in no sense likely to improve upon the native earth, air, and water. If we could but throw all liquid impurities into the ocean, or into some great lake or river, and the gaseous impurities into the air—both in such way that the offensive matter should quickly become mixed with a great excess of the water or the air—all offence would at once cease. The same purification would be effected if the filth were buried in the earth. But we are still far from attaining either of these desiderata, and hence it is that proximate and artificial processes of disinfection are resorted to and esteemed by the public. If we ventilate—in the narrow sense which attaches to the act to-day—there must still be provided some chemical system of absolutely destroying the noxious gases, lest they re-enter upon us or afflict our neighbor, If we bury without taking heed that an adequate quantity of earth be used—then again the chemist is looked to for something which shall gloss over the slighted work. After the river or tide-way has become lined with banks of sewage-deposit, as was recently the case with the Thames, at London, then of a certainty, with the advent of a hot summer, or of any epidemic disease, the whole question of disinfectants will come up for renewed consideration.

Of late years our knowledge of disinfectants has been considerably increased, both by the discovery of new particulars—as in some of the methods of obtaining and applying ozone—and by the introduction of clearer conceptions of the import of several of the old empirical practices. Three tendencies of the later scientific work upon this subject are to be noticed: first, to classify known empirical methods; second, to give a just theoretical explanation of the efficacy and mode of action of these old, and in fact of all, methods of disinfection; third, to make widely known among the people both the theory and practice of methods which have heretofore been only locally, imperfectly, or superstitiously applied. These points may be illustrated by two or three examples.

Thus in the case of tar, the antiseptic power of this substance has been known, more or less clearly, ever since the Egyptian dead were swathed in tarred cloths; and that knowledge of this sort does not die out from among men may be seen in the accounts of pestilences in the cities of hot climates. At New Orleans, for example, the wrapping of infectious corpses in tarred sheets before burial has long been a common expedient. That the odor of tar is esteemed "healthy" by the masses need not be said, and in like manner we all agree with the popular dictum that pine forests are generally free from malaria. Even the London gas companies have a notion, in which there may be a germ of truth, that the purlieus of their works are, as a general thing, remarkably free from the ravages of epidemic disease. The preservation of fish and of flesh by smoking is another familiar practice. The antiseptic properties of some of the constituents of tar, as creosote and carbolic acid, have gradually been made out; and stress has been laid upon the disengagement of ozone which attends the oxidation of these bodies and their congeners. But it is only recently that chemists have been accustomed to group together these scattered items of knowledge, or to look upon them as related one to the other. Renewed attention was directed to the value of tar as a disinfectant, some six or eight years since, by a Frenchman named Corne, who proposed to employ a mixture of coal-tar and plaster of Paris as a universal disinfectant. This proposal occasioned much comment at the time, and was examined and criticised upon every hand. It has doubtless led to a much clearer appreciation of the purifying power of tar than had previously been had. The method of Corne, be it mentioned in passing, consisted merely in mixing tar with so much plaster of Paris, or

dry earth that the mixture could be handled as a dry, non-adhesive powder, fit to be scattered freely anywhere.

As a second illustration we take charcoal. The purifying properties of this substance have long been vaguely known. Its effect is, in fact, identical in kind, though greater in degree, with that of the soil, which as every one knows, possesses a remarkable power of absorbing offensive matters. It is only in comparatively recent times, however, that anything definite has been known of the manner in which the earth acts. The first step towards an explanation of it was the discovery of the fact that charcoal and other porous bodies have the power to suck in and absorb gases as a sponge does water. Subsequently, years after the foregoing fact had become familiar, it was noticed by the English chemist, Stenhouse, that the disinfecting power of porous materials, such as charcoal and earth, depends not merely upon the mechanical ability of these materials to absorb offensive gases, but also, and mainly, upon the fact that the absorbed gases are chemically destroyed within the pores by the condensed oxygen which has previously been sucked into these spaces from the air. Under ordinary circumstances, while in contact with the air, the pores of charcoal, of earth, and of similar porous substances, are of course always charged with oxygen, by virtue of their absorptive power. Whenever, therefore, any new gas is taken in and forced into intimate contact with this oxygen, it is precisely as if the new comer had first been carefully collected and then subjected to the action of some corrosive chemical agent. A host of foul and offensive gases can in this way be burned up and annihilated. It should be always remembered that the char coal constantly draws in to destruction the offensive matters about it; and, conversely, the volatile constituents of coal-tar seek out and attack their enemy, the noxious effluvia. Herein the charcoal and the tar manifestly possess advantages over non-volatile agents on the one hand, or those devoid of porosity on the other.

Besides explaining the *modus operandi* of the porous disinfectants, Stenhouse's discovery is interesting in that it brings this entire class of substances into harmonious relations with the chemical agents proper. That the efficiency of the latter depends, as a general rule, upon their oxidizing power, is a fact which is every day becoming clearer. As the connection between the various systems of artificial disinfection is thus gradually made out, we arrive at a more just appreciation of the processes of purification which prevail in nature. It is now more clearly apparent than ever before that oxidation is the natural method. In nature, when filth is absorbed by the earth, washed away by rain, or mixed with the atmosphere by the force of the wind, it is destroyed not by virtue of mere dilution, but by being gradually brought into contact with active oxygen. As was just now said, our artificial processes are, as a rule, valuable in proportion as they can quickly effect a similar result. We fail, however, in this—that whereas in nature the putrescible matter is carried away to meet oxygen in due course without special oversight, we are compelled in artificial disinfection to bring oxygen in comparatively large quantity to the matter which, through our negligence, has been allowed to pass into the putrescent condition.

A FRENCH LOVE-STORY.

The "Revue des Deux Mondes" has just brought to light a little book printed in Paris for private circulation, only a hundred copies in all, entitled "Histoire d'un Amour Chrétien." It contains simply the story of the loves of a young Frenchman, M. Albert de la Ferronnays, of good Legitimist and Catholic family, and Mlle. Alexandrine d'Alopeus, the daughter of a Swedish gentleman in the Russian service, and for a long time minister of that Government at Berlin, and of a French mother. It is told in their own journals, from which a sister of the lady, Mrs. Craven, has shaken the dust of thirty years, and put them into the hands of the friends of the family. The story is a real romance, in many of its features thoroughly French, but on the whole so very un-French, or rather so very unlike what we are in the habit of considering French, that it is interesting, if only as a study of manners. We are all of us so familiar, either through books or plays, or through actual experience of French life, with the ordinary course of French match-making, and so little prepared to find in it either much passion or much sentiment, that when we read of a young couple of good position, who have managed, in spite of the "*convenances*," and if not with the approval, at least without any very strong opposition on the part of their parents, to fall violently in love, and to stay in love through three or four years of trial and difficulty, and finally to marry in complete indifference to fortune, we are apt to rub our eyes incredulously. We have all heard of what happens when the French "*jeune fille*" becomes of a marriageable age, and has a *dot*; how the parents decide when the time has come to find her a husband; how the father thinks of some other father, of his acquaintance, who has a young man to marry, to whom he will give about the same amount; how he goes and sees this father, and discusses the match with him; how snugly and carefully the money matters are all arranged before the young people are brought together; how, when they are brought together, the *jeune fille* receives her *futur* with downcast eyes, and converses decorously with him, or walks in the garden with him in the presence of her mother; and how at last she goes to the *mairie* and the church with him, and takes him according to the contract for better or for worse, without ever having exchanged two syllables with him, except in the hearing of a third person. If we are to believe French novels, the mass of these matches do not turn out well; and perhaps they do not turn out what we, with our ideas of what the relation of husband and wife ought to be, would consider well. But we doubt very much whether there is as much positive domestic unhappiness in France as in either England or America. Frenchmen and Frenchwomen have a respect for the *convenances* which makes mere vulgar bickering rare, and then social usage has with them made the marriage contract so intensely *civil* that probably less is expected of the married state by both young men and young women than amongst us, and there is, consequently, less disappointment.

The courtship of M. de la Ferronnays and of Mlle. d'Alopeus is rendered still more singular and interesting from the fact that it was not only based on deep affection and the free choice of the parties, but was marked throughout by the deepest religious feeling. M. de la Ferronnays was an ardent Catholic—one of the most intimate friends of Montalembert in those early days when something very like a revival was running through the Catholic youth of France; when Lacordaire was preaching and Lamennais was writing, and when it seemed to many devoted men that progress and reform might still find in the Church their most powerful ally. The young people appear to have first met at Rome in 1830, where M. de la Ferronnays (*père*) was French ambassador, and the first indication Albert gave of his feeling towards the young lady was the earnestness with which he wished that she could be induced to turn Catholic. In fact, in his efforts for her conversion, his affection, down to the hour of his death, seems to have found its highest expression. One of the exclamations which she records in her journal, as uttered by him one day on meeting her—"I am so happy this morning; I have taken the communion, and I love you!"—is a curious indication of the vein of religious fervor which ran through the more earthly passion.

Some of the passages in his journal in which he records his own mental struggles show that the hardest and keenest of all were those in which he fought against the tendency which he naturally enough found growing in him, as time wore on, to secularize his love, if we may use the expression, and seek "the beloved object" for herself, be she Catholic or Protestant, heretic or infidel.

"Oh, how long ago it seems," he says in one passage, "since I went to the church every few minutes to pray for *her*. . . . Oh, my God, when I asked for her conversion, even at the cost of my life and of my happiness, was it at the cost of the happiness of loving thee? Lord, grant that in saving her I do not lose myself! Take from me all joys but the love of what is good. This may I never cease to feel. . . . Rekindle in my heart the fire of thy divine love! Purify the sentiment which is now my life!"

He went through a long period of privation and agony before he had the full assurance that his love was reciprocated. The lady was calm, doubtful, and somewhat analytical. The gentleman prayed, hoped in his journal, and poured forth his doubts and misgivings in long letters to his friend, Count Montalembert. One day she lent him her journal, so that he might get some idea of the kind of person she really was, but with certain pages at the end sealed, or pasted down, as forbidden ground. He broke through the barrier, read the whole, and found amongst some pages of self-examination the delightful words, "*Je crois que j'aime Albert.*" He was so transported by this that he confessed his own perfidy, and received such a look as plunged him in shame and despair. He wrote to Montalembert, telling him all, and describing his offence in terms worthy of the unpardonable sin. "The moment," he said, "that I saw my treachery was frightful. There was contempt in her eyes. Hell could not have caused me greater suffering." Montalembert had some difficulty in persuading him that crimes of this kind are not recorded in heaven and that he might still hope for peace. The lady herself forgave him before long, and he wrote to his friend with ineffable satisfaction: "At last my fault is forgiven; she no longer bears me a grudge for having discovered her secret. I say nothing of how I feel. You can guess it." We doubt if he could.

Not long after he went to still greater lengths, showing how rapidly young men who have once entered on a course of sin get hardened. He kissed Mlle. Alopeus. How this happened we must allow mademoiselle to tell, herself:

"My mother was dining at Count Stakelberg's, and Albert's parents also. I was allowed to dine with Fernand, Albert, and their four sisters. This

was amusing. After dinner Pauline and Eugenie had their toilettes to make, and went to their room. The two little sisters began to play together at the piano; so that Fernand, Albert's brother, might be said to be the only person with Albert and me. He found this a little awkward, pretended to go to sleep, and laughingly covered his face with his pocket-handkerchief. After some time (Albert and I had been talking near the mantelpiece) I wanted to go away, as I thought it hardly proper that I should remain alone with my friends' brothers and their little sisters; but I lingered, unable to make up my mind to go, when Albert slightly touched my forehead with his lips, but very rapidly. I was vexed, and, without saying a word, gravely took my shawl and went down stairs.

"Alone in my own room, I could only think, and what to think I hardly knew. I certainly was annoyed, and it seemed to me that our delightful existence had changed its aspect, and to his disadvantage. I was no longer quite sure of loving him so much, and I hoped he would not come down until mamma had come in, or until some third person was present. Malte came, and soon after Albert, with a very sorrowful air. As soon as he could, he told me that I had distressed him by my look. He appeared penitent, and did not try to excuse himself; *but his eloquence was so great, he spoke so well, that the cloud completely passed away from my mind.*"

M. Albert was evidently not only a sinner, but a specious, artful sinner.

Things had now come to such a pass that some decision had to be reached by the parents as to whether the lovers were to be married or not. These ladies and gentlemen, with true continental suspicion as to the depth of young people's love, insisted on a two years' separation as a final test of the durability of the attachment. The lovers assented, and heroically determined to make the test still severer by breaking off all communication during that period, and during the whole of it wrote but one letter each. Albert, always delicate, then fell sick and lingered for some weeks on the edge of the grave. When he recovered it was evident, no one doubted any longer, that they were meant for each other. But M. Alopeus was dead. Madame was "worldly," and was herself going to marry a Russian prince rejoicing in the euphonious name of Lapoukhyn, and was opposed to her daughter's marrying anybody who, like Albert, had neither fortune nor career, but had delicate lungs. Alexandrine, too, was one of the maids of honor to the Empress of Russia, who, it was feared, would never consent to her marrying a Frenchman, Nicholas at that time holding all Frenchmen in abomination. Then there was an old friend of the family, Mlle. Catiche, who had dreamed of very brilliant alliances for Alexandrine, and mourned daily over the prospect of seeing her thrown away on a man who was neither a general of division nor a minister plenipotentiary. While tormented in this way, Alexandrine indited in her diary the following bit of philosophy. From the pen of an American girl it would seem commonplace enough, but from the pen of a girl born and bred in European diplomatic circles there is something in it strangely mature; it is a real outburst of mutiny:

"I have been sometimes curious to know if there will be 'careers' in heaven; if generals and ministers will there be held in greater consideration than people who have made no noise in the world. . . . 'Career!' the very word has become intolerable to me. . . . Mademoiselle, when you have met some one who in your judgment will please you, do not, before allowing him to charm you too far, inform yourself as to his religion or his principles; as long as he has not stolen or committed crime you may be satisfied. Banish all too lofty or ridiculous expectations; find out if he can give you all your life, and give your children after, *more* than the superfluity necessary to secure you all the comforts of life. If you can make sure of this point, the most essential of all, marry him without fear; you will be happy. But if he whom you are disposed to love has just enough to live on, and you hear romantic people tell you that the woman who marries him will be to be envied; that the solidity of his character is such as to assure you that his life will be pure; that his religious principles will never be shaken; that his modest tastes will never betray him into extravagance; do not listen to talk so *exalté*, so wild, so wanting in knowledge of the world."

They were married at last, in 1833, at Naples. Her mother would not let her wear at the wedding her pearl necklace, because pearls meant tears; so she wore a diamond cross given her by Albert; "cross of love," the bride wrote, "given by love—and which since then has seemed to me so significative." The cross was no less ominous than the necklace. In ten days after the ceremony Albert had a hemorrhage of the lungs, and the remaining two years of their married life they spent wandering about from place to place, vainly seeking a peace that was to come no more. Those were the only ten days during which Madame de la Ferronnays was not haunted by the prospect of her husband's death. Some happy weeks they had at Pisa with Montalembert, who read them in the evenings chapters of his forthcoming "Life of St. Elizabeth of Hungary," in the intervals of Madame de la Ferronnays' music; but this was soon over, and the night darkened slowly down. Madame de la Ferronnays continued to write to him as their "dear Montal," pouring forth her hopes and fears day by day. At last nothing was left her to do but to prepare with fortitude for the great catastrophe. At Venice she transformed herself completely into her husband's nurse never left his room, took entire charge of him, dressed "like a cook" or a chambermaid, as she wrote to her sisters, and led the life of one; told her "dear Montal" "that he would laugh if he saw her surrounded by potatoes, candles, and rice."

At last, as a supreme act of devotion, she fulfilled her husband's dearest wish by becoming a Catholic, and took the communion with him a few days before his death. Her journal during the last days of the long agony is inexpressibly touching, and so is the prayer with which it closes, written eight days after all was over:

"My God, put not asunder that which thou hast thyself united! Forget me not, my God, my Father, and pardon my boldness! Remember us who always remembered thee! Remember that not even one love-letter ever passed between us in which thy name was not pronounced and thy blessing invoked! Remember how often we have joined in our prayers to thee! Remember how constantly we have desired that our love might be eternal!"

She followed her husband in a very few years.

DECENCY AND DIVORCE.

WE are threatened in New York with another divorce trial which promises, if all that the lawyers say about it be true, to be tolerably disgusting. That the proceedings will be faithfully reported and eagerly read there can be no doubt, and that it is a horrible misfortune for any community to have such stuff served up for its perusal every morning at breakfast, is also unquestionable. An effort has been made to have the case to which we allude submitted to a referee and heard privately; but the judge has refused the motion, we will not say properly, but perhaps excusably, and it will be heard in open court. The fact is that divorces by collusion have become terribly common, and this collusion has been facilitated by the practice of having these cases tried in a lawyer's office, without one of the guarantees for justice and fair dealing and propriety which have been found necessary even for the preservation of judicial purity. The theory on which our procedure in divorce cases is framed is, that in every one of them there is one guilty and one innocent party; that the innocent party wants to be formally released from a contract which the other has virtually broken, but that the guilty party wants to have it continued, and will feel terribly afflicted if it is abrogated. We need hardly say that this is in perhaps four cases out of ten a false theory. The guilty party is in at least this proportion of instances just as glad to get rid of the tie as the other, and does all in his or her power to facilitate the proceedings. In this State the offender is supposed to be punished by being forbidden to re-marry; but this prohibition is about as effective as an attempt to starve a man by forbidding him to eat lobsters would be. He has only to go into another State with the partner of his guilt, or any other woman, in order to marry as soon as he pleases. In fact, no matter what care any State may exercise in the preparation of its marriage laws, they may be, and are, practically nullified by the careless legislation of its next neighbors. As long as the Western States look on the marriage contract, as many of them seem to do, as merely a device for legitimizing children, nothing that can be done in the Eastern States will do much to raise or keep the popular estimate of its sanctity. Judging from the divorce returns of many of the former, marriage in them is in a fair way of becoming merely temporary cohabitation, dependent for its duration on the whim or caprice of either party. We are not here advocating greater restriction in divorce or laying down any rules as to the grounds on which divorces ought to be granted, but we think the slovenly haste with which the courts grant them is scandalous and pernicious to the best interests of society. The tendency in this State, as well as elsewhere, has been to treat the whole matter of divorce as one which only concerned the parties in each case. But society has the strongest interest in all conjugal differences. The family is the bond which keeps the state together, and every man and woman in the community has the strongest interest in having every husband and wife compelled to live together as long as they can possibly stand it, without injury to health or morals, and in seeing that separations are not granted so as to promote vice. In fact, we want a general marriage law for the whole Union, just as much and more than we need a general system of coinage. All American men and women ought to be married and all American children be born under the same law.

Correspondence.

VERMONT AND HER SENATORS.

TO THE EDITOR OF THE NATION:

The Legislature of Vermont will have to make choice at its next session of two senators of the United States. It will not be difficult to find among

the able citizens of that patriotic State men well fitted to maintain the principles to which Vermont is pledged, and to do her honor in the national councils. There is, however, one man among the sons of Vermont so conspicuous for the qualities most required in the service of the country, that it will be a public misfortune if the accident of his absence from the country at this time should prevent the State from making choice of him as one of her senators. The Hon. George P. Marsh has long had a national reputation. As a statesman, a diplomatist, and a scholar, it is needless to say that he stands in the first order. There are few living Americans who have done more to raise the national reputation in departments hitherto little cultivated among us than he. To the most accurate, varied, and profound learning he unites the wisdom derived from long experience of men and affairs in many lands. His acquaintance with the political history of the United States is such as few men possess; and his devotion to those principles which are at the foundation of our free democratic institutions, and which are most dear to New England, has the ardor of a passion.

The services of Mr. Marsh as member of the House of Representatives are still well remembered, and America has rarely been represented abroad by a more accomplished and able diplomatist.

The selection by Vermont of Mr. Marsh as one of her senators would not merely be honorable to the State, but would be a real and distinguished service to the country.

I am, sir, your obedient servant,

A New Englander.

May 25, 1866.

FINANCIAL REVIEW.

NATION OFFICE, Thursday,
May 31, 1866.

THE news by the *Persia* has had the effect of stiffening gold and exchange, as the Liverpool cotton market continues to exhibit weakness. Gold rose on the receipt of the news to 139. To-day, at 3 P.M., it stands at 139⅞. Exchange was in better demand for the Java. Sight sterling sold at 111, and a large business was done in francs. Sixty-day bills are not wanted, as the stringent money market in London would render it difficult to negotiate them. The *Java* and other steamers yesterday took out $3,191,400, and perhaps $3,000,000 will go on Saturday. The Government is no longer a seller of gold, and it is said that some Congressional limit will be set to its operations in this field hereafter. The money market is relapsing into the condition of ease which prevailed before the recent gold sales. Six is becoming the rule for call loans. The Secretary of the Treasury reports that the amount of paper circulation afloat is $930,808,471, of which $269,403,095 is National Bank currency. With so enormous a volume of paper money afloat, and no commencement of contraction inaugurated, money cannot but be cheap, and prices can hardly fail to rule high.

The stock market has been greatly excited of late, partly by a heavy fall in Erie and partly by active fluctuations in Governments. Erie, which sold a few days since at 74, was done on Monday evening at 57¾, and has since fluctuated between that figure and 62. Facts which have been more than once stated in this column have at length been publicly acknowledged. The company is practically bankrupt. To keep the wolf from the door, it has borrowed of its leading director, Mr. Daniel Drew, $3,000,000 on the security of $3,000,000 of convertible bonds and $2,800,000 of common stock. Unless its circumstances improve suddenly and largely, the loan cannot be paid, and when it matures, if not before, the concern will once more pass into the hands of a receiver. Of course, all hope of a summer dividend is abandoned. Simultaneously with this heavy decline in Erie, the Prairie du Chien clique has forced up the price of New York Central to 98. It seems doubtful whether this company will pay the summer dividend. It is probable that the bulls are operating more on the presumed existence of a large short interest than on intrinsic values. The corner in Pittsburg appears to have collapsed without the least excitement. The price was run up by the clique to 101, but at the price nobody wanted to buy. There were no shorts, it seems, who were obliged to cover, and in the course of a couple of hours the price fell to 87¾, and this morning to 83¾. The clique own all the stock, and seem to have but little prospect of finding a market for it. In other stocks there is no change of moment.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	May 24.	May 28.	May 31.	Advance.	Decline.
United States Sixes of 1881	108¼	109	109¼	¼	....

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

OF EVERY DESCRIPTION.

MANUFACTORY AND WAREROOMS,

9, 11, and 13 Mercer Street, New York.

☞ Special attention paid to the fitting up of hotels, halls, private residences, etc., etc.

THE NATION

Was, when started, essentially an experiment. Journals of a similar character had been tried and had succeeded in Europe, but the idea that there was enough interest felt here in literature or in art to support a paper mainly devoted to the discussion of literary and art topics, or that there existed what economists call an effective demand for any more careful or more general discussion of political news than writers of the daily press working between dusk and dawn were able to supply, was scouted by many. Our experience, so far as it has gone, satisfies us that it is this want of faith rather than want of appreciation which is the greatest difficulty which any such journal has to contend with here. Thousands enjoy it for the one who believes that his neighbors will enjoy it, and, of course, any very widespread doubt of its success increases the difficulty of succeeding.

For the guidance of those who may feel disposed to assist us with their contributions, we may mention that the contents of THE NATION will fall nearly under four divisions—or that, at all events, these divisions would have to be kept in mind by anybody writing for it as a volunteer.

1. References to, and concise comments on, the news of the day, with the view of fixing the degree of its importance, and suggesting its bearings upon and relation to the main current of contemporary history.

2. Reviews or comments, whether in the shape of letters or articles upon important events, and upon the utterances of those who are, or are trying to be, leaders of public opinion.

3. Accounts more or less detailed, or discussions of such occurrences in the social, literary, artistic, or scientific world as are likely to interest men or women of education and intelligence. Under this head we do not include mere gossip about nobodies, or advertising chronicles of the sayings and doings of quacks, daubs, penny-a-liners, dilettanti.

4. Critiques of publications or works of art of sufficient merit to make it desirable that the public should ever hear anything about them.

TERMS—$5 per annum; 6 months, $3.

When delivered by Carriers in New York or Brooklyn, $1 additional.

JOSEPH H. RICHARDS, Publisher,

130 Nassau St., N. Y.

RAVEN & BACON'S PIANO-FORTES.

GEO. G. SAXE & CO.,
417 Broome Street, N. Y.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT

PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.

Topics of the Day.

THE gravity with which the *World* and some other journals, ordinarily sensible, have been discussing the "strategy" of the Fenian campaign, is something very comical. It is no wonder the Fenians are audacious, when they find the press either so gullible or so ready to help them in gulling others. The public was treated on Saturday to ponderous speculations as to whether the movement on Fort Erie was not "a feint" intended to cover an invasion in force, headed by Sweeney, on the St. Lawrence, as if the main body was likely to be one whit better armed, organized, or provided than O'Neill's force. We have all of us now seen enough of war to know that an invasion got up secretly by small parties of men who meet for the first time the night before going into action, without artillery, or stores, or officers, is not warfare, but is crime of the blackest hue. The character of the whole movement is well indicated by O'Neill's reason for retreating, which is that his men had nothing to eat and no artillery, and the enemy were closing round them in force with Armstrong guns. Even Fenians must know that artillery, ammunition, and other supplies besides whiskey are needed to carry on a campaign. The events of the last week, instead of showing Fenianism to be no swindle, prove it to be a more abominable swindle than ever. Upon any sound view of moral responsibility, Sweeney would have been no less culpable if a man had never crossed the frontier. To the guilt of obtaining the money of servant girls under false pretences, he has now added that of spending it in robbery and murder. And, so far from helping the cause of Ireland, the movement will but degrade the national character in the eyes of the civilized world.

"EVERY foot of room on the hospital ship" at the quarantine is officially reported to be "full of the sick and dying." Yellow fever has arrived on a brig from Porto Rico, and there is no place for yellow-fever patients unless they are put in one ward with cholera patients. And while this is the state of things in the hospital, the crowded emigrant ships, which have made the voyage from Europe, from which patients are every day taken "in a moribund condition," are tossing up and down in the lower bay, and the Board of Health find it impossible to get the infected vessels emptied and the sick, once for all, separated from the well. There is no doubt that this state of things is disgraceful, and there is no doubt that if neither the city of New York, nor the State of New York, nor the United States Government, can legally get land on Coney Island or Sandy Hook, or some suitable place, for the erection of quarantine buildings, then they would do well to join together, take it illegally, and what money is spent in litigation will be saved in the bills for coffins and burial hammocks. On Saturday and Sunday there were thirty-eight new cases of cholera and fifteen of them resulted in death.

DISMAL accounts are given of the Southern cotton crop. Much bad seed was used, which failed to germinate; just when this was discovered came news of the tax of five cents a pound to be levied on the ginned staple, and many men, instead of replanting cotton, put in corn; the weather generally has been unfavorable, and for these reasons a very small yield is predicted. It is noticeable that the cry which might have been expected about this time is hardly audible, and the reasonable supposition is that the negroes are working well. It is much to be wished that the year had proved a good one for the encouragement that would have been given to both planters and laborers, the latter, on a majority of the Southern plantations, being part owners of the growing crop.

IT has been judicially decided in Mississippi, in a suit for the specific performance of a contract made during the war, and under which payment had been made in advance in Confederate notes, that the war was not a rebellion, but "a war between two distinct sovereignties to settle a question of governmental power." The judge also laid it down *obiter*, that a man "cannot commit treason when his action is controlled by State authority." So the vexed question is not settled after all, and yet with a little care on the part of Mr. Johnson, after the rebels laid down their arms, it might have been settled so that no State judge should ever even hesitate about it.

WHAT we had to say in a late issue about protection for naturalized American citizens abroad, must be modified for France by intelligence just received at the State Department. Minister Bigelow writes that if such citizens liable to conscription in France go at once upon their arrival there to the *mairie* of the district in which their names are enrolled, and produce the evidence of their naturalization in the United States, they will, upon application, probably be relieved of the service which they have otherwise to apprehend.

CERTAIN malicious culprits who used to cut engine hose in this city have now, Fire Commissioner Abbe says, "turned their attention to, and are, practising with the incendiary's torch;" and the pernicious assiduity of this malignant class, added to the newly invented "application of phosphorus to the system of incendiarism," calls for the utmost vigilance on the part of good citizens. The commissioner's language is a little warm, but he seems to look at the matter in a creditably cool and scientific manner. Since the 1st of January there have occurred in New York 370 fires, "a number unprecedented in the history of any city in the world." We may expect an increase in this number, because, for one thing, detection is difficult, and, then, "business is stagnated," and many men with stocks of goods heavily ensured and declining in price will "prefer to close them out at once to insurance companies" rather than sell them at a loss. The Board offer a reward of $1,000 for the apprehension and conviction of any incendiary. On the other hand, it is the inefficiency of the new Fire Department, the friends of the old one say, which causes so great an increase

in the number of fires, which is simply absurd. The business of firemen is not to prevent fires breaking out, but to put them out after they have broken out. To prevent people setting houses on fire is the duty of the police, the judges, and the school teachers.

A BILL is now pending in the House of Commons which, if passed, would do more for Irish prosperity and happiness than if the island were made the seat of the Holy Roman Empire, with the Pope occupying one wing of the Parliament House, General Sweeney the other, and a million of Fenian soldiers acting as coast guard. It provides simply that a tenant may improve his farm whether the landlord pleases or not, and that if the latter ejects him he shall pay for the improvements at a valuation. Mr. Lowe, on the part of the English Conservatives, opposed it as an interference with the rights of property, in one of those almost brutally cynical speeches which have done almost as much as actual oppression to breed Irish hatred of English rule. He was replied to by John Stuart Mill with extraordinary power, in a speech which, for the purity of its English, the closeness of its reasoning, and the force of its appeals to great principles, has rarely been surpassed. Nothing could be fairer or more conclusive than his answer to those who hold, with Miss Cobbe, that a true Fenian's idea is simply the offspring of Irish folly.

"People often ask," he says, "why should that which works well in England not work well in Ireland? or why should anything be needed in Ireland which is not needed in England? Are Irishmen an exception to all the rest of mankind, that they cannot bear the institutions and practices which reason and experience point out as the best suited to promote national prosperity? Sir, we were eloquently reminded the other night of that double ignorance against which a great philosopher warned his contemporaries—ignorance of our being ignorant. But when we insist on applying all the same rules to Ireland and to England, we show another kind of double ignorance, and at the same time disregard a precept older than Socrates—the precept which was inscribed on the front of the Temple of Delphi. We not only do not know those whom we undertake to govern, but we do not know ourselves. (Hear, hear.) No, sir, Ireland is not an exceptional country; but England is. (Hear, hear.) Irish circumstances and Irish ideas as to social and agricultural economy are the general ones of the human race; it is English circumstances and English ideas that are peculiar. Ireland is in the main stream of human existence and human feeling and opinion; it is England that is in one of the lateral channels. If any honorable gentleman doubts this, I ask is there any other country on the face of the earth in which not merely as an occasional fact, but as a general rule, the land is owned in great estates and farmed by capitalist farmers at money rents fixed by contract, while the actual cultivators are hired laborers, wholly detached from the soil, and receiving only days' wages? (Hear, hear.) There are parts of other countries where something like this is tolerably frequent, but Great Britain is the only country where it is the general rule."

DIPLOMATIC and non-diplomatic manifestations in favor of peace were, at last accounts, becoming more frequent and significant in Europe. Official invitations to attend a congress at Paris, emanating from the cabinets of France, England, and Russia, were despatched, on or about the 21st of last month, to the courts of Vienna, Berlin, and Florence, and a favorable reply was expected, if not already received, from all of them, though not without important reservations, protesting against the discussion of the most vital international questions. A self-constituted congress of German deputies, embracing delegates from most of the German States, to the number of two hundred, assembled at Frankfort, and adopted resolutions condemning the threatened fratricidal war, declaring its originators guilty of the gravest crime against the nation, execrating those who might attempt to cede to the foreigner any portion of German territory, calling on all states not actually engaged in the dispute to abstain from the contest and preserve their forces intact for the gravest emergencies, and urging a speedy convocation of a German Parliament, on the basis of the electoral laws of 1849. Popular meetings taking the same ground were daily reported. It was also stated that an attempt to facilitate an amicable solution of the German imbroglio by a simultaneous resignation of Count Bismark, Count Mensdorff, and Baron Beust, the leading ministers of Prussia, Austria, and Saxony, was being made by the three sisters, the Queen Dowager of Prussia, the mother of Francis Joseph, and the Queen Dowager of Saxony. Baron Rothschild, of Frankfort, declined to raise a loan for Prussia. Nevertheless, the contending governments continued to push forward their warlike preparations with the utmost energy and despatch, and the universal belief in the imminence of a general European conflagration was unshaken.

CONGRESS.

WASHINGTON, June 2, 1866.

Two important legislative steps have just been taken in the direction of nationalizing our railway system. One of these ensures the completion of a direct railroad line from this capital to the Northwestern States, *via* Cumberland and Pittsburgh. The existing obstacle has been the narrow and selfish policy of the Legislature of Pennsylvania, which has attempted to create impediments in the way of the completion of the line from Cumberland to Pittsburgh, lest it should divert business from the Pennsylvania Central. The bill now passed interposes the authority of a law of Congress, and empowers the Pittsburgh and Connellsville Railway Company to complete their line through Pennsylvania to Cumberland, and declares it a national public highway and post-road. Another statute, similarly framed, empowers the Cleveland and Mahoning Railroad Company to complete their line through Pennsylvania to Pittsburgh. Both measures have passed the House by handsome majorities.

The attempts of the Southern sympathizers in the Senate to emasculate the constitutional amendment have been steadily voted down by a majority of more than three-fourths. The prospect is that this measure will receive the sanction of considerably more than two-thirds of the House, and be sent to the States for ratification or rejection within the present month.

DIARY.

May 30.—In the Senate, a bill for payment of the Kentucky militia called out in 1862 was passed. The joint resolution proposing an amendment of the Constitution was discussed by Messrs. Howard, Cowan, Conness, Johnson, Doolittle, Trumbull, Hendricks, Guthrie, Sherman, and Saulsbury. The first section, declaring all persons born in the United States to be citizens thereof, was adopted. Also, the second section, apportioning representation according to numbers, deducting from the basis in any State such population as are denied the right of suffrage. The third section was taken up, excluding from holding office under the United States or under any State all persons who, having taken an oath to support the Constitution of the United States, have engaged in rebellion against the same; and providing that Congress may, by vote of two-thirds, remove this disability. Mr. Saulsbury moved to amend the final clause by adding that the President, by the exercise of the pardoning power, may remove this disability; lost—yeas, 10; nays, 32. Mr. Johnson moved to except State officers, not being officers of the United States, who have taken such oath; lost—yeas, 10; nays, 32. He also moved to limit the disability to those who have taken such oath within ten years preceding 1861; lost—yeas, 10; nays, 32.

In the House, the bill to reimburse the war debts of the loyal States was postponed to the next session. Mr. Bromwell made a speech on reconstruction. The bill to reduce and establish the pay of officers of the army was defended by Mr. Schenck and opposed by Messrs. Blaine and Thayer.

May 31.—In the Senate, the third section of the constitutional amendment was opposed by Messrs. Doolittle, Davis, and Saulsbury, and defended by Messrs. Grimes and Willey. Mr. Doolittle's amendment, to limit the application of the disability to hold office to those who *voluntarily* engaged in rebellion, was lost—yeas, 10; nays, 32. The third section was then passed—yeas, 32; nays, 10. The death of Lieut.-Gen. Scott was announced, and the Senate adjourned to Monday.

In the House, the bill to authorize the Cleveland and Mahoning RR. Co. to extend their road into Pennsylvania and to establish it as a military and postal railroad was passed—yeas, 77; nays, 41. The bill to promote the construction of a line of railway between Washington and the Northwest for national purposes was passed—yeas, 69; nays, 37. Adjourned to Monday, June 4.

THE FREEDMEN.

THE side of the Freedmen's Bureau which is least frequently held up by its enemies is brought before the public by Gov. Parsons's appeal to Gen. Howard for an increase of rations to the destitute whites of Alabama. The assistant commissioner for Missouri and Arkansas estimates the rations for June at 89,000, whites, and 11,000, freedmen. Alabama's petition is enforced by the sensible conduct of the people of Perry County, who met at Marion, on the 17th ult., to provide means for encouraging the freed people in their wishes and efforts to acquire a common-school education. The call was signed by the Hons. A. B. Moore and J. M. L. Curry, and was addressed to men and women.

—The editor of the (La.) *Houma Guard*, taking a walk by Bayou du Large, saw very few negroes in the fields, which were not, however, neglected. The laborers were "the planters themselves, their sons, or, in a few instances, white assistants;" "men, women, and children," as he says in his next sentence; and, "mostly, educated gentlemen," for a final statement. They were all ploughing, hoeing, harrowing, or planting, and the crops were generally in fine order. These industrious persons would probably scout the title of "freedmen," but we do not know any who deserve it better.

Notes.

LITERARY.

THE American Oriental Society has recently (May 16) held its regular annual meeting in Boston. Due notice was taken of the members who have deceased during the past year—among them, of the German poet and oriental scholar Rückert; of the Second King of Siam, known to many Americans by his European education and his love for America (one of his sons is named George Washington); of not less than five missionaries in the East; of the lexicographer Worcester; and of the eminent scholar and patriot, Dr. Charles Beck, of Cambridge, one of the society's founders, and long a vice-president. Of Dr. Beck, Prof. Lane, of Harvard College, gave an eloquent eulogy. President Woolsey, of New Haven, was elected president for the ensuing year, Prof. Salisbury having positively declined re-election. Dr. Peter Parker was chosen a vice-president in the place of Dr. Beck. Rev. Mr. Sherring, an English missionary at Benares, addressed the meeting at some length respecting the history and antiquities of that chief centre of Brahmanism, pointing out the decadence of the Hindu religion and learning. The genesis of the English possessive case, ending *s* (*king's son*, etc.), was discussed by Prof. Hadley, of New Haven, in a full and searching criticism of Mr. Justice Manning's recent paper in the Transactions of the Philological Society of London. Prof. Hadley conclusively proved the justness of the common view, that the case-sign in question is a representative of the Anglo-Saxon genitive ending, against Mr. Manning, who regards it as a contraction for *his*. Prof. Whitney, of New Haven, endeavored to show the sufficiency of the solution arrived at by comparative philology of the question respecting the historical beginnings of Indo-European language—namely, that these were monosyllabic "roots," significant of quality or action—answering especially the objections of those who hold that the first words must have been the names of concrete objects. He argued that the first things cognized were by no means the first named; that language was framed for communication, its beginnings were determined by the possibilities of mutual intelligence, and its development went hand in hand with the analysis and recognition of the qualities of objects, which alone admitted of direct designation by intelligible signs; and that, in all ages of the history of language, things had been named from their qualities, and in no other way. Rev. E. Burgess, of Mass., discoursed of the respective claims to originality of the Greek and the Hindu science of astronomy. Mr. Burgess is one of the few persons left who believe in the antecedence and independence of the Hindu system, and his paper was an elaborate defence of his faith. Its positions and arguments were stoutly controverted by Professor Whitney. Other papers of less importance were offered, and the society adjourned to meet again in October, at New Haven. It has lately published the concluding part of the eighth volume of its journal, containing important contributions to our knowledge of the Nusairian religion (long a dark subject to Oriental scholars), of the ancient astronomy of the principal Asiatic nations, and of the theory of the spoken alphabet and its representation by written signs. None of our learned societies has gone on more unostentatiously and effectively in its appointed course of research for many years past than the Oriental, and its publications are favorably known all over the world as true additions to the world's knowledge.

—Mr. Ralph Waldo Emerson, who has published nothing of late except the admirable article on "character" in the last number of the "North American Review," has been delivering a course of lectures in Boston and elsewhere. These lectures are announced for speedy publication in England under the name of "Philosophy for the People." The titles of the lectures or chapters are: The Seven Meters of Intellect; Instinct, Perception, Talent; Genius, Imagination, Taste; Laws of the Mind; Conduct of the Intellect; and Relation of Intellect to Morals. We suppose Messrs. Ticknor and Fields will soon announce the American edition, which is probably printed in England for the sake of cheapness.

—One of the recent translators of Homer, Mr. Philip Stanhope Worsley, died on the 8th of May. He was a fellow of Corpus Christi College, Oxford, and a frequent contributor to the *Reader* and "Blackwood's Magazine." His miscellaneous "Poems and Translations" were published in 1863. His "Iliad," intended as a companion to his translation of the "Odyssey," has been announced for some months as in press, but was only half completed.

—The controversy as to the authenticity of the Paston letters, began by Mr. Herman Merivale, is now ended. The committee of the Society of Antiquaries appointed to collate the fifth volume of the letters with the original manuscripts that were so luckily found at Dungate, the residence of Philip H. Frere, Esq., in a box labelled "children's toys," have made their report. The report is long and minute, and sets forth the manner of collation and the unquestionable genuineness of the letters. They are undefaced, uninterpolated, and untampered with. Even the expressions which were most objected to as being of modern use were found in the originals. Search is being made, under the direction of the Lord Chamberlain, through the royal palaces and libraries for the originals of Vols. I. and II., which were presented by Sir John Fenn to the king, but thus far without success.

—The editor of the *Autographic Mirror* gives occasionally an interesting and characteristic letter among his specimens of chirography. In the last number is a letter from Mrs. Opie, dated Norwich, 10th mo., 10th day, to the editor of the *Amulet*, one of the popular annuals of that time, whose neglect has touched her literary pride and her purse. She writes thus: "Amelia Opie is surprised to find that her name is omitted in the list of the contributors to the *Amulet* of this year. She has received her copy of it, and thinks it *admirable* in all respects. A. O. will be glad to receive the promised remittance when convenient." In the same number is a letter from Chateaubriand, dated 1802, when he had taken advantage of the short peace to visit Paris. This was a time of great poverty for him, when he was glad to accept assistance from the Literary Fund Society of England. He writes to the Rev. Bence Sparrow, of Beccles, Suffolk: "Paris, December 11, 1802. Sir: Here I am back again in Paris, after a journey of more than six hundred leagues. I do not find any letter from you on my arrival, but I learn that my porter has lost a letter which came from England. If, by accident, it was yours, will you have the kindness to write me another one, and let me know what I am indebted to you and to every one else at Beccles? If the sum is moderate, I shall, perhaps, be able to pay it at once; if too large for my present means, I hope you will have the kindness to give me a little time. I am closely occupied with my new editions, which are about to appear with magnificent engravings, the designs for which are made by the best painters of this country. I have just had sent to me two English translations of "Atala"; one is abominable; and the other, by Mr. Barnavelt (who writes to me himself), is excellent. I am loaded with praises and cradled in hopes. I merit the first but little, and I too well know what the second are worth. Accept, I pray you, sir, the compliments and salutations of your very humble and very obedient servant."

—Next to the poems of the Arthurian cycle, the ballads which have taken the greatest hold on the popular mind of England are those which celebrate the name and fame of Robin Hood. The exploits of the British king were perhaps nobler, and performed on a broader stage; but the deeds of that bold forester of the Middle Ages, who was in arms against all oppressors, and who always protected the poor, have been dearer to the people's heart. Yet Robin Hood, though he is a personage of historical times, is probably as mythical a character as Arthur. There is as great difficulty in making a real man out of the ideal yeoman and archer of the twelfth century as there is in reducing to correct history the sagas of the Norsemen or the legends of the Breton bards. There seems, however, to be a certain amount of truth in all the Robin Hood ballads. There is such an air of circumstantiality about them and so many allusions to real persons and events, that they could hardly have sprung entire from the vivid brain of any ballad-monger. A very complete collection of these Robin Hood ballads has just been published, with notes, by J. M. Gutch, F.S.A. It includes all the pieces in Ritson's and Percy's collections, besides many which have been picked up in out-of-the-way places, and others which have been taken down from the lips of old people. The plays on the subject of Robin Hood and Little John, which were once so popular throughout England and Scotland, until they were forbidden by act of Parliament, have not come down to us, and were probably never reduced to writing, but handed down by tradition from one set of actors to another.

—A small but important volume to the investigator of the origin and history of the races of the human family has lately been published, called "Die Sagen und Lieder des Tcherkessen Volkes," "Tales and Songs of the Circassians, collected by Kabardiner Schora-Bekmursin-Nogmow, edited, with introduction, by M. Adolf Berge, President of the Caucasian Archæographical Commission." The author is a native Circassian, educated by the Emperor of Russia, and now in his service, and gives in his book much interesting and novel information respecting his country and compatriots.

—A bilingual inscription of great value has been discovered by Dr. Lepsius at San, the former Tanis, the scene of some of the great architectural undertakings of Rameses II. The words of the inscription, which is much longer than that on the Rosetta Stone, are legible throughout. The hieroglyphical inscription has thirty-seven lines, the Greek seventy-six lines of considerable length in small letters. The demotic inscription is wanting, though referred to in the body of the text. It is dated in the ninth year of

Ptolemy Euergetes I. (B.C. 238), and celebrates the birthday of that king and enumerates all his good deeds, amongst them the merit of having recovered in a military expedition the sacred images carried off in former times by the Persians. It gives the whole theory of the *two* years—one in use among the people, and the other known by the priests—as propounded by Dr. Lepsius in his chronology. Photographs and impressions of the inscriptions were taken, and the text will be published by Dr. Lepsius as soon as he returns to Berlin. On the Isthmus of Suez there were also found Persian monuments of the time of Darius, to commemorate his work of the canal between the Red Sea and the Nile.

—There is only one vernacular literature in India which has not been content with imitating the Sanskrit, but has endeavored to outshine it. That is the Tamil, written in a language spoken by about twelve millions of people in the Carnatic, and by about half the population of Ceylon. The earliest specimens of the Tamil literature date back to the eighth century A.D. With the exception of commentaries and some modern works the entire literature is in poetry. Mr. John Murdoch has lately printed at Madras a "Classified Catalogue of Tamil Printed Books, with introductory notes," which is a very valuable contribution to our knowledge of the Tamil literature. The first Tamil types were cut at Amsterdam, in 1678, but were so bad as not to be understood by the natives. The next attempt was at Halle, Saxony, in 1710, to supply the Tranquebar mission. The present excellence of Tamil typography is owing to Mr. P. R. Hunt, of the American Mission press at Madras. In 1863 there were ten native presses in Madras. Mr. Murdoch has described 1,755 books, which he has arranged in ten classes: Religion, 1,218; Jurisprudence, 19; Philosophy, 50; Science, 62; Arts, 6; Literature, 152; Philology, 176; Geography and History, 12; Periodicals and Newspapers, 26; Books for Europeans studying Tamil, 34. Introductory remarks, of a historical, literary, and statistical nature, precede each class. The books are very carefully described, and their contents marked. The general introduction, besides a great amount of information on general literary questions, contains notices of 119 Tamil authors.

—The first volume of "Dante e il suo Secolo," the work produced in honor of the sexcentenary of Dante's birth, is on the eve of publication at Florence. It is edited by Professor Ghivizzani. Besides papers of less importance, the volume contains a view of Europe in the age of Dante, by Cesare Cantù, the historian; a view of the political administration of the States of Italy at that date, by Luigi Cibrario; an account of the Dante family, by Luigi Passerini; an essay on the religion and piety of Dante, by Manro Riccio; Dante's theology, by P. Paganini; his politics, by Terenzio Mamiani; Beatrice, by Guis. Puccianti; Dante's philosophy, by Aug. Conti; the Inferno, by F. Guerazzi; the Vita Nuova, by Orlandini; the Convito, by Fornari; and the people of Tuscany at the date of Dante, by Gino Capponi.

—We find from official statistics that at the beginning of this year 372 newspapers were published in the kingdom of Italy. Of these 41 were published in Genoa, 42 in Florence, 44 in Milan, 44 in Naples, and 51 in Turin; the rest in smaller towns. When compared with the population returns, these figures give one paper to 93 inhabitants in Milan, one to 111 in Florence, one to 120 in Naples, one to 136 in Genoa, and one to 171 in Turin. The enthusiasm which pushed Italy to its national unity and now makes it eager for war, and which made the *consorzio* for paying off the national debt popular with all classes, is also displaying itself in literature. The well-written articles in *La Nazione* and *La Perseveranza* show that good minds are devoting themselves with zest to political discussion, and the excellent articles which have appeared in the *Nuova Antologia* since it was revived at Florence display an equal effort in higher literature. The desire of all writers and thinkers in Italy, as is apparent in all their articles, is to make Italy again what it once was, and to arouse and call out the dormant energies of a great and quick-witted people.

—In the Emperor Napoleon's "History of Julius Cæsar" there is a note which contains a list of the sovereigns and princes who have busied themselves about Cæsar's campaigns in Gaul, showing that somehow they have peculiar attractions to persons in exalted positions. Charles the Eighth, of France, particularly admired Cæsar's Commentaries, and the celebrated monk, Robert Gaguin, presented to him in 1480 the French translation he had made of the Gallic war. The Emperor Charles the Fifth left a copy of the Commentaries, filled with copious marginal notes, written by his own hand. The Viceroy of Sicily, Ferdinand Gonzaga, sent a scientific mission into France to study Cæsar's campaigns in the localities. Henry the Fourth translated the first two books of the Commentaries, and Louis the Thirteenth the last two; an edition of both was printed at the Louvre in 1630. Louis the Fourteenth also translated the first book; Christina, Queen of Sweden, composed "Reflections on the Life and Actions of Cæsar;" Philippe Egalité, the Duke of Orleans, was a great reader of the Commentaries, and had a map of Cæsar's campaigns in Gaul made. The first Napoleon employed himself at St. Helena in dictating a summary and criticism of Cæsar's wars, which was published in Paris thirty years ago.

—A protest against the prevalent dulness of religious tract literature has been entered by the Bishop of Oxford. At a recent meeting of the Society for Promoting Christian Knowledge the bishop said: "It is more difficult to get tracts read than to get them written. In this matter there is a terrible danger ahead—a danger which can never be escaped, a fault which can never be forgiven. We can forgive almost anything in a man who comes to talk with us if he avoids that one unpardonable offence of dulness. We may not agree with him; but so long as he avoids dulness, that is of little importance." He was of the opinion that books suited to all shades of opinion should be admitted to the society's depot, or "they would very soon reduce all their publications to one delicious shade of drabness."

SCIENTIFIC.

The Strength of Insects.—Felix Plateau has made some careful experiments with the view of ascertaining the force exerted by insects in pulling, pushing, and flying, as compared with that of some of the vertebrated animals. The force exerted in pulling was determined by attaching to the body of the insect a thread supporting a small pan and passing horizontally over a pulley. Weights were added to the pan until the maximum an insect could move was reached. Pushing, as effected by the "burrowing beetles," was measured by causing them to act upon one of the arms of a horizontal lever turning on a vertical axis, to the other arm of which was attached a thread and pan as in the preceding case. The force developed in flight was determined by attaching a mass of wax to the hinder pair of legs. This mass was at first made too large, and then gradually lightened until the insect could bear it away. In these three modes of investigation the muscular force of a given species is represented by the proportion between the mean maximum weight of the mass moved by a certain number of individuals, and the mean weight of the insects moving it.

Leaving flight out of consideration, insects have, relatively to their weight, an enormous strength in comparison with vertebrates. The average weight of a draught-horse (in Belgium) is about 600 kilogrammes (1,323 lbs. av.), and he can exert only for a short time a force of 400 kilogrammes (882 lbs.), or a force equal to about two-thirds of his own weight. Among insects the melolontha or *hanneton* exerted a force of fourteen times its own weight, anomala Frischii a force of twenty-four times, and donacia nymphææ of forty-two times their respective weights, when their force was used in pulling. In pushing, one of the "burrowing beetles" moved a mass equal to three times its own weight, another a mass sixteen times, and a third a mass seventy-nine times its own weight. In flying, as shown by experiments on the humble and hive bees, the weight moved is less than that of the body. In the first species mentioned it was only two-thirds the weight of the body, or about the ratio which obtains in the case of the draught-horse; and in the honey-bee it was a little more than three-fourths of that of the body.

Plateau has made another observation which has a physiological interest, and which is so constant that he calls it a law. It is this: If in the same family or tribe of insects we compare two species which differ considerably in weight, the members of the smallest species will exhibit the greatest force. In other words, the force, estimated by the relation of the weight moved to that of the animal moving it, varies from species to species in an inverse ratio to the latter weight. From this it appears that the smaller species have muscles of a different quality from those of the larger species. A similar difference is often noticeable between the larger and smaller domesticated animals, even of the same species. In the human body it is frequently found that a small mass of muscle in one individual has more energy than a larger mass of corresponding muscle in another.

Premium to Inventors.—An imperial decree, dated April 18, 1866, explains the prize of 50,000 francs offered by the French Government for the best discovery for the utilization of the voltaic pile. The competition is thrown open to persons of all nations for five years from the date of the decree. The claims of the competitors for the prize will be examined and judged by a commission appointed by the Minister of Public Instruction, to whom all communications can be addressed. The purpose of the prize can be best stated in the very words of the law: "A prize of 50,000 francs, to be decreed in five years, is instituted in favor of the author of the discovery which will render the voltaic pile applicable with economy to industry, as a source of heat; to illumination (*éclairage*); to chemistry; to mechanics; or to practical medicine." Although most discoveries are made in disinter-

ested investigation, a prize as large as this ought to excite scientific students to renewed energy.

THE HOLY ROMAN EMPIRE.*

THE veneration for names and places, however explicable it may be in some instances, is often really mysterious when the object of it is an institution, as was the case with the Holy Roman Empire of which Mr. Bryce has recently published so excellent a sketch,—a sketch which we cannot but commend as on the whole a contribution to historical literature; calm in its tone, and clear, if not philosophic, in its method. Its style, however, unaffected and terse, is better adapted for reasoning than for narrative, which requires more vivacity and grace. And in fact the work is substantially an essay, dealing only occasionally with original authorities. There is now and then, perhaps, something like a glow of eloquence perceptible; but the author's taste is good, and he limits himself severely for the most part to his immediate topic of explanation. Written at first for a prize essay, the book has grown under the author's hands; and this edition of it makes, we believe, practically a new treatise. And perhaps the author could set himself no better task for life than to go on and fill up at length the outline which he has now completed of this extraordinary phenomenon in history; the phenomenon, that is, of the superstitious reverence for an institution necessary in the earlier phases of civilization, still asserting its supremacy long after the idea it represented had not only disappeared, but its place had been taken by another of exactly contrary character in a civilization of an exactly contrary type.

The Roman Empire, in spite of the well-meant rhetoric of Cicero and the dagger of Brutus, was a logical necessity of antiquity. So long as the Romans fought for supremacy in Italy, the republic answered its purpose. Its real downfall began when the Roman mind first became conscious, however dimly, of its mission of universal conquest. How soon that consciousness began to exist, it is, of course, impossible to determine; but it must have been very long before Cæsar, or Cæsar would not have been possible. With universal conquest arose that sentiment of unity which found its expression and its agent in a single chief. It is easy to call Cæsar names, and still easier to find fault with the reasons which Napoleon III. has announced to Europe as his justification in the political pamphlet which the imperial author has entitled the "Life of Cæsar." But it is not easy to see how, with the work of conquest done and the work of assimilation beginning, anything but the strong hand of absolutism could have held together the discordant parts of the great Roman world. And the fact that Cæsar was not only necessary but inevitable is seen in nothing more than in the supremacy which the very idea of centralization he represented acquired over the minds of men; for the last phantom of that idea did not disappear till Bonaparte scattered it, with so many other mediæval superstitions, at the beginning of the present century.

But though the empire was necessary to the Romans in bringing about the political unity at which they aimed, it was not necessary, after that unity had been attained, for the spread of Christianity, which it had adopted as its religion. The diffusion of Christianity was, of course, accelerated by the unity of the Roman world; but after it had seated itself on the throne of the Cæsars at Constantinople, political unity was an absolute hinderance to its further development, because that development interfered with the political security of the emperors; a fact of which the Eastern Empire furnishes a lamentable illustration. There may not, perhaps, have been much difference in the degree of superstition between the East and the West from the age of Charlemagne to that of the last brave Emperor of the Greeks, over whose dead body the victorious Ottomans swept, as with the surge of an angry sea, to unfurl the standard of the Prophet on the pinnacles of St. Sophia. The Greeks, it is true, were much more refined, and preserved with the language most of the traditions of the ancient civilization; and we cannot but hope that the day will come at last when more justice will be done them than they have received hitherto; but they were, nevertheless, very superstitious, if not as grossly so as the West. The religious unity, however, which they received as part of their political inheritance, was more and more concentrated in their ecclesiastical organization, and, surviving the overthrow of the empire, still exerts a paralyzing influence upon the Greek mind throughout the East.

With the West, on the other hand, after the fall of Rome before the invading hordes of Attila, the necessity for political unity had really ceased, for there was no power to wield it. The Roman world was breaking up; new forms of society were organizing under a new influence, and that influence was not political but religious. And in this last fact lies the whole of that stupendous difference between the ancient and the modern world which for so many centuries the holy Roman emperors so steadily ignored, if they did not rather fail to perceive it, as Mr. Bryce has done.

Political unity was the dream of the Roman world, because it knew no other world than itself. Carthage had been extirpated, and with it perished the Phœnician predominance in the Mediterranean. Egypt was a mystery which the ignorance of the Romans abandoned to the Greeks, and the Greeks invented explanations to conceal their own ignorance; while they themselves, never a nation, were less an element than they had been. There was, in short, no world but Rome, no civilization but the Roman. When, however, Christianity had been fairly established and brought to bear upon the northern nations, the unity of the modern world began to exhibit itself in the contemporaneous development of various races upon the common basis of the Christian culture. For just as fast as the races crystallized, became French, German, Italian, with new languages and a higher civilization, just in that degree the Roman ideal of political unity became impossible. When, in the year 800, Charlemagne received from Pope Leo III., in the basilica of St. Peter, the crown of the Cæsars, which three centuries and a half before had been laid down by the pitiable Romulus Augustulus, the last of the Western emperors, the very reason why he could revive, even in appearance, the empire which he fancied he reproduced, was the low stage of civilization in the diverse races over whom his sway extended. The moment that, in the midst of all the ignorance and discord that surrounded him, his strong hand and wise forethought had laid the foundation of a better polity, his empire declined, for the need of it declined.

The ideal of unity which, from being political, became religious and made the East so effete, which Charlemagne thought he had grasped, and which, after him, was taken up by the popes when they became strong enough to control the emperors—this ideal of unity, both in civil and spiritual things, was opposed by the whole current of the rising society of the West. Everything was against it, increasing diversity of laws as well as varying tastes and modes of thought; but, more than all, that intensifying of races which has only latterly come to be taken into account in reconstructing European governments, but which from the days of Charlemagne, when it began, has been the leading feature in the movement of European society into that higher plane where the greater the diversity the greater the unity, because the consciousness of individual national existence is more personal, so to speak, and the law of love of which, in Christianity, all races had for the first time a common perception, is more pervading.

But of this fundamental fact, which we have thus taken pains to indicate, in the development of the modern world as distinguished from that of the ancient, Mr. Bryce has taken no notice. And this, in a critical point of view, seems to us the great defect of his book. It is true, as he shows, that the northern races had a superstitious belief in the eternity of that empire whose power had kept them at bay and overshadowed them with its majesty for so many centuries; and in a sense it is true that when Charlemagne took up again the crown of the West, there was a craving for a guiding hand and a central force. But that craving was only temporary and partial. The whole history of the Middle Ages is hardly anything more—in one aspect, at least, nothing more—than the chronicle of this incessant deadly struggle between emperor and pope, between Ghibelline and Guelph, between rulers, heirs of a tradition of empire, and subjects blindly groping for the light they knew, as by sheer instinct, to lie beyond the turbulence of faction and the desolation of war.

With Charlemagne began the Holy Roman Empire, properly so called; and for a thousand years, under various forms, it dominated the minds of men with more or less force until, in 1806, the Emperor Francis II. resigned the imperial crown, and the last phantom of the ancient civilization fled affrighted from the world it had haunted so long. But our limits do not permit us to follow the history of this title, for it was nothing more, which Mr. Bryce has presented so clearly, and with a certain originality for which he is entitled to praise. It must be borne in mind, however, that Mr. Bryce's statement is not exhaustive; there is another side to the case which he omits. It was the claim of the Western Empire to be the legitimate successor of the ancient imperial dominion; but the Eastern Empire was a standing protest against any such assumption, while the dispute which never ceased between emperor and pope as to who gave and who received the crown, and which Mr. Bryce himself displays considerable ingenuity in discussing, shows that there was at least as much confusion as to the real nature of the power that ought to go with the title as with respect to the legality of the title itself.

Uncalled for, therefore, as we affirm, by the condition of the age, the Holy

* "The Holy Roman Empire. By James Bryce, B.C.L., Fellow of Oriel College, Oxford. A new edition, revised. *Tu regere imperio populos memento.*" Macmillan & Co. London. 1866.

Roman Empire was never more than a phantom acting upon the superstitions of men, not a theory of government in harmony with the tendencies of the time; rather, as we have said, in direct opposition to them; and, therefore, all the more curious as an illustration of the authority of names and the sanctity of traditions which refuse to die for no other reason, apparently, than that they once had life.

RITCHIE ON SCRIPTURE WINES.*

It has been argued that in these latter days, when the average mental and bodily soundness of poor humanity is the evil product of the wickedness and ignorance of many generations of doctors, to say nothing of patients, degenerate mankind, womankind perhaps, ought to be allowed a "little something" stimulating. Noah's vineyard, it has been suggested, that first postdiluvian agricultural enterprise, was not actual merely, but mystical and emblematical also, typifying the new flood, compensatory for the watery one, which should float us, though but momentarily and at rare intervals only, away from the modern world and back to the primal force and vigor of our race, so that on the far side of this deluge, as of the other, there might be found brightening of the eyes, a straightening of the bowed back, a forgetfulness of poverty, the thews and view-halloo voice of eupeptic Nimrods, the untaught wisdom of the first fathers, and, with the rest, all in an hour, the antediluvian length of days.

But this is mere speculation. It is not supported by the Scriptural view of wine. Noah, Dr. Nott, of Mobile, remembering Ham and Canaan, may defend if he likes; Mr. Ritchie will not. Besides, he can give up to the Mobile philosopher the whole case of his patriarchal founder of a recently defunct system of labor. He does not need that to prove by the most conclusive testimony that the Bible approves total abstinence and condemns and forbids the use of anything which can intoxicate. Take *asis* for example; that is one of the Scriptural Hebrew words meaning wine, and it occurs in five texts. Three of these speak of it favorably, and in two it is condemned. Why this preponderance of permissions over prohibitions? Mr. Ritchie asks. He answers that *asis* was generally the pure juice of the grape or pomegranate, and in its worst state was not intoxicating, but only rather apt to stupefy the drinker. "This, let it be remarked," says Mr. Ritchie, who does not like speculation, "is not mere theory; it is the voice of facts." Look at Isaiah xlix. 26; judgment is there denounced upon the wicked, who should be "drunken with their own blood as with *asis*." Now comparisons, our author justly remarks, "to be natural, must be drawn between things which exhibit a resemblance in the points in which they are compared. There is no appropriate resemblance between persons drunken with blood and those drunken with intoxicating wine; the effects on both body and mind are wholly different. From this comparison, then, we conclude that it is a *stupefying* power in *asis* that is here indicated, and not any intoxicating quality." It is clear enough, Mr. Ritchie thinks, that the texts with *asis* in them afford no sanction for the use of an *intoxicating* wine. We can imagine quite an infatuated drunkard finding this logic inexorable.

Then there is *chamer* or *chemer*. That word is found in eight verses of the Bible, and is translated *wine*. The four cases in which it bears a bad sense occur in the fifth chapter of Daniel, where the king Belshazzar drinks *chemer* and commits sacrilege. These texts surely encourage no one to drink intoxicating liquors. As for the commendatory texts—as where Moses declares of the children of Israel, "Thou shalt drink of the blood of the grape," of the *chemer*, he obviously meant grape-juice as when first pressed and flowing fresh from the vat. Passages with *chemer*, then, are of no more use to the drinking man than passages with *asis*.

There are seven other words in the Scriptures which have been translated by the English word wine. There is *tirosh*, which is always mentioned as an excellent thing. But *tirosh* means something solid; our word *grapes* is the right interpretation of it. That rendering at once shuts off the enemies of total abstinence from all appeal to thirty-eight texts; so much of the testimony of Scripture is valueless to them.

Then there is *yain*, and *mesech*, and *eshishah*, and *sobhe*, and *shemarim*—their testimony is examined. We have shown what is our author's method of working with his data, and about how valuable and convincing his conclusions are likely to be. Yet, of course, there is something to be learned from the book. It requires not half the author's power of drawing inferences to conclude from it that the people are not all gone, that some of them, perhaps, live in the parish of Dunse, Scotland, who incline to believe that astronomy, and geology, and various other branches of knowledge a little apart from religion, are taught in the Hebrew Scriptures. As for the rest, take the common run of men and they have less knowledge of the sacred text than Mr. Ritchie, and their argumentative abilities are rather superior, so that the volume will benefit more people than it misleads.

* "Scripture Testimony against Wine. By Rev. Wm. Ritchie, of Dunse, Scotland." New York: National Temperance Society. 1866.

May Carols, and Hymns and Poems. By Aubrey De Vere.—(New York: Lawrence Kehoe. 1866.)—Provided only he has any poetical sensibility, the most orthodox Protestant, indignant at creature worship, or the most science-ridden philosopher may read these hymns in honor of the Virgin with very great pleasure. The writer of the "May Carols" was, perhaps, a born Catholic, and in a deeper sense than his christening priest would have said. He was, perhaps, too, a born devotee of that mystically sweet and tender phase of the Romish faith—the *cultus* of the Blessed Virgin. But he was also a born poet, and, far as his work may seem removed from mere popular appreciation, a poet after the popular ideal. This, at least among us northern nations, is not the myriad-minded seer, the mighty master, the intellectual and artistic maker, but rather the susceptible and sympathetic singer; the æolian harp rather than the organist; the minor poet, in short, whom the people have with them always and amongst them, rather than the great creative genius, comprehensive of heights and depths, who is above their heads and away from their hearts. These "May Carols" are tender, grave poetry of this order mingled with such religion as might flow from the same source. It is like the soft, misty breath of the south wind, and there is the perfume of censers in it. Nature everywhere colors the verse, but is oftener used in similitudes, or for its own sake, than made emblematic. She is painted in her details, too, with an elaboration that reminds of Tennyson and speaks of the love the poet bears her and her power over him, so that he asks, the poet of nature triumphing over the religionist:

> "Ah, tell me in that heavenlier sphere
> Must all of earth have passed away?"

There is sometimes wanting perfect clearness in the language, and sometimes, though rarely, the simple beauty of thought and feeling is marred by the intrusion of a mere conceit. An instance of this is the following stanza of the "Sancta Maria:"

> "The mystery high of God made man,
> Through thee to man is easier made.
> Pronounce the consonant who can
> Without the softer vowel's aid."

But generally the effect of the poetry is purely delightful. The outward appearance of the book is reasonably good, but not what such a poet, in these days of wide-embracing blue and gold issues, ought to have. It is not a book for the ordinary American Catholic market, and might have profitably worn a more tasteful and expensive dress.

Footlight Flashes. By William Davidge, comedian. (New York: American News Company.)—To the experience and wide field of observation, the keen sense of the ludicrous, and a certain knack at story-telling which seems to come natural to actors, we are indebted for some of the most amusing volumes of anecdote and gossip in the language. These, of course, are valuable in proportion as they deal with professional incidents. When written with more ambitious aims they are, with rare exceptions, no better than hundreds of books of their class, but are apt to be much worse. Any one who knows the vicissitudes of an actor's life, or has studied the curious second nature that often overlays his original character, rendering him, as the great Elliston once remarked of himself, *off* the stage precisely what he is *on* the stage, and sometimes a greater oddity than any he personates, will understand that the stage and its surroundings afford ample material to any of its children who may aspire to literary honors. Mr. Davidge has in the main adhered to this principle, but, notwithstanding a professional experience of more than thirty years in Great Britain and America, cannot be said to have made a very valuable addition to theatrical ana. His stories, while amply suggestive of the footlights, are too frequently trivial and pointless, and his really good things are marred in the telling by an affected style which he mistakes for humor. The best passages in his book are those describing the internal economy of a theatre and the complicated machinery by which plays are produced. The budding actor may glean from these some knowledge of the calling which he hopes to make his own, and would do well to consider seriously the author's very sensible remarks on the processes by which a great actor is formed. Mr. Davidge shows that there is no royal road to acting more than to learning, and that familiarity with stage business from childhood almost, and a regularly ascending scale of parts, are, in most cases, indispensable to make a "well-graced actor." From his personal experience he gives one or two examples of the readiness with which a veteran, trained in such a school, can sometimes help a friend out of an awkward dilemma—as, for instance, by assuming at short notice a part which he has never studied, and extemporizing the language so happily as not to interfere with the action of the play. His remarks on the "star" system in theatrical performances are also well considered, and will doubtless be generally approved.

Memoirs of a Good-for-Nothing. From the German of Joseph von Eichendorf. By Charles Godfrey Leland. (New York: Leypoldt & Holt. 1866.)—This ceased to be a world of latitude and leisure some centuries ago. We have vagabonds, to be sure, but our nineteenth century vagabonds mostly want to "strike ile," somewhere, or represent some new territory. They wander over the face of the earth as fell-minded and with as definite a purpose as their great forefather Cain. Nobody nowadays throws himself on to the stream of life to drift, but rather with all his might each of us paddles his own canoe, whenever he can using the aid of machinery, for since the loss of our original uprightness we have sought out many inventions. Even upon our innate laziness we have founded the dreadful science of political economy. Adam Smith and Malthus we have made the logical consequents of Melibœus and Amoretta on the grass. But if there is still left any one who

still some traces of Eden inherits, who can enjoy an hour's dream of perfect aimlessness, we advise him, with incongruous earnestness we urge it on him, to give himself the great pleasure of reading this charming book. The vignettes pleasantly illustrate the text, and we only find fault with the somewhat too comic picture of the poor lover weeping bitterly in his boat.

PARIS GOSSIP.

PARIS, May 18, 1866.

AFTER the darkest and chilliest *lune rousse* with which we have been plagued for many years past, Paris is once more rejoicing in the magnificent blue canopy it looks upon as its right. The bonnets are growing smaller and smaller, but, as they now consist mainly of a flower and a pair of strings, they can hardly diminish much more without reaching the vanishing point. In crinolines the reduction of circumference is also very appreciable; the two new forms of this season, viz., "the Empire" and "the Victoria," being so small as to cause those of last season to look extravagantly "bundling" and awkward. The new crinolines, moreover, being hooped only below the hips, constitute a decided commencement of return towards the proportions of mother nature. Nothing striking in the way of "fashions" has appeared as yet, the sudden return of cold weather having retarded the issue of the sovereign ukases that rule the whole feminine world, according to the caprices of the "Quartier Breda."

The absorbing question of the moment, "peace or war," seems no nearer a solution than it was a fortnight ago; but the breaking out of a new struggle, of which no one can measure the proportions nor divine the issue, is deprecated by the Parisians of all classes and parties. The influence of the extraordinary man who is remoulding the French people as completely, if not as rapidly, as he is remodelling Paris, is in nothing more plainly revealed than in the diminished appetite for military glory so apparent to all who are given to watching "the signs of the times." The enormous development of every species of material activity, the stimulus applied to the productive and commercial enterprise of the nation, the vast and rapid increase of wealth and the eager desire for luxury and physical comfort now visible among all classes, which constitute so distinctive a feature of the France of the present day, render this people, formerly the most belligerent of Europe, increasingly averse to the perturbations, waste, havoc, and physical horrors of war. They have got "glory" enough—they have annexed Nice and Savoy; they have a preponderating influence in Europe. For the moment they want nothing more in the way of military prestige, and every one wants, on the contrary, if poor, to grow rich; if rich, to grow richer. The general aspiration is, therefore, after peace; and the warlike preparations now stirring so large a portion of the continent of Europe are excessively unwelcome, as, when once the struggle shall have begun, it is feared that France will, in some way or other, find herself drawn into it before it is brought to an end. Ardent, therefore, are the good wishes of the Parisians for the success of the diplomatic efforts which France and England are believed to be making at Vienna, Florence, and Berlin. The Prussians are, evidently, not anxious for war; the Austrians would greatly prefer a state of peace; but Italy, the retention of whose undelivered provinces under a foreign yoke compels her to a ruinous outlay in view of their eventual deliverance, is boiling over with warlike enthusiasm. Not only the entire Italian press, but all private letters from Italy, represent the entire nation as having reached a state of incandescence that leaves far behind it in intensity even the great volcanic upheaving of 1859. When the soul of an entire population is in the electrified state in which the Italian people now finds itself, the slightest cause suffices to create a lively impression. Thus, a few days since, the two winning numbers of the state lottery first drawn at Florence being 59 and 66, the Italians, who are not a little given to superstition, have acclaimed these numbers with intense delight as a favorable omen.

But, to return "à nos moutons," by a half Italian transition, let me mention, as a new item in the attractions of this already so very attractive city, that the spirited individuals who have united in purchasing the Pompeian villa of Prince Napoleon in the Avenue Montaigne, and who are making of it an Etruscan and Roman museum of very great value and interest, are to inaugurate the new use of the edifice in question by giving, on the 22d inst., in the *atrium* of the villa, a grand dinner to all the leading literary and artistic celebrities of the capital. The entertainment is to be as exact an imitation as possible of the dinners of classic times. The dishes are all to be Roman; but whether the guests will be compelled to eat in the semi-recumbent posture of classic days, we are not informed. The invitations already issued are said to be very faithfully imitated from the style in vogue at that period. They are printed on large sheets of thick, glossy modern paper; but, to give something of a classic air to these sheets, they are ornamented with a vignette, in Etruscan style and colors, cleverly imitating the slips of painted papyrus which the aristocratic Amphytrions of ancient Italy employed as cards of invitation.

The splendid balls of the departing season being now "gathered to the things before the flood," the gay world is again taking its pleasure in dinners. The new Turkish ambassador, Sayvet-Pacha, who seems to have as easy an intuition of the resources of Paris life as though be had lived here from his cradle, has just given one of the luxurious little entertainments for which he is becoming so famous, and which the most practised Sybarites of this region would find it difficult to equal. This last achievement of the representative of the Sublime Porte was offered to seven guests—four ladies and three gentlemen—all of the highest distinction. The dinner is described by the guests as "indescribable," and the wines, *liqueurs*, service, and accessories as worthy of a place in the Arabian Nights. The plate used on this occasion was the magnificent service of silver-gilt presented to Sayvet-Pacha by the late Sultan, formerly alluded to in these letters; and the coffee was again served in the fairy-like cups of gold filigree, enriched with jewels, and scarcely bigger than large acorn-cups, which had already excited the enthusiasm of his guests at the dinner he gave last winter. After the dinner a concert was given by the very first *artistes* of the capital, all engaged at a very high figure for the sole delectation of the luxurious Pacha and his seven favored guests.

Not quite so sumptuous, though very splendid in its way and intensely enjoyed by all present, was the one hundred and twenty-fifth annual dinner of the society of musicians called "The Children of Apollo." How many revolutions, wars, discoveries, and changes of all kinds have occurred on our little planet since the formation of this society! How many celebrities, now passed away, have been inscribed in its annals! And with how much interest should one look down the vista of its next hundred and twenty-five years of existence, were it permitted to mortal eyes to see so far into the millstone of the future! All the great musical names of the last century and a quarter figure on the lists of these fraternal dinners: Bach, Cherubini, Haydn, Hummel, Méhul, Piccini, Viotti, Paesiello, Monsigny, Onslow, Halévy, and their rivals of each successive generation. At the dinner of a few days ago all the musical notorieties of the present day were present. After the dinner an excellent orchestra executed compositions of several of the members, and fragments of various classical and modern works were admirably performed by the most distinguished players and singers, of both sexes, and the president, Marquis de Queux de St. Hilaire, made a speech between the two parts of the concert so witty, so elegant, and so perfectly appropriate to the occasion as to call forth the enthusiastic acclamations of the assembly.

The king of violin players, the unrivalled Sivori, whose powers each year seem to have reached the ultimate limit of possible perfection, but who, with every new year, gains so greatly as to throw the last year's performances into the shade, has been winding up his brilliant successes by giving the aid of his marvellous *archet* to a concert got up by himself, Braga, Jaël, Galvani, and Mlle. Bellerive, in aid of an old violinist, Morena, whose laborious career has left him poor. The concert was, of course, magnificent, and the proceeds constitute a welcome help to the worthy old professor. The great violinist has also given his aid to poor Mlle. Thuillière, playing in the interlude at her benefit at the Odeon, from which she is obliged to withdraw through the injury to her health occasioned by the setting on fire of her drapery, while acting at the theatre a few months ago, and is now condemned to an existence of pain and misery, unable to work and utterly without resources. What a sad contrast to the brilliant fortunes of the popular idol, Thérésa, whose engagement at the Alcazar has just been renewed to the tune of 145,000 francs per month.

"The Abbé Liszt" is still here, and appears, despite his tonsured crown, to preserve all his old love of shining as well as his wonderful execution. The other night, at a musical *soirée* given by the popular artist Gustave Doré, Liszt played a number of his new compositions to a brilliant company composed of duchesses, ambassadors, sculptors, authors, painters, musicians, and other notorieties. Among these was his "Dante," a musical rendering of the "Divina Commedia" of the great Florentine, for two pianos. This composition, being highly Wagnerian, would have been simply unbearable but for the almost superhuman playing of "the abbé" himself and the scarcely less extraordinary execution of M. de Saint-Saëns, who played with him. After this vast ocean of learned cacophony, Liszt played, alone, his "Francis d'Assise walking on the waves," and which contains passages of wonderful beauty, especially the movement in which, while the left hand produces a marvellous imitation of the "roaring of many waters," the right hand performs a movement totally distinct and equally descriptive, calm, sweet, majestic, luminous, *suave*, admirably presenting the march of the saint, sustained by the Divine assistance, upon the wild pathway of the waves.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

MR. STEVENS'S NEW PLAN OF RECONSTRUCTION.

Mr. Stevens is so justly dissatisfied with his own report from the Committee of Fifteen, especially since the only clause of it in which he felt much interest is clearly defeated, that he has introduced a rival project upon his own responsibility. The new plan has the merit of being more practical than any of Mr. Stevens's previous inventions, and would, with some modifications, work well. Possibly, however, these modifications would destroy every feature of the bill which is attractive to its author.

Section 2 of this bill recognizes the *de facto* State governments at the South as valid "for municipal purposes," though irregular, and not entitled to representation in Congress.

Section 3 provides that *when* the existing legislatures shall call State conventions, they shall be elected as prescribed in the bill.

Sections 4 and 5 permit all male citizens, being twenty-one years of age, to vote for and serve as delegates to these conventions.

Section 6 declares all persons who held office under the "so-called Confederate States," or who took an oath of allegiance thereto, to have forfeited their citizenship, and requires them to be naturalized, in like manner with other foreigners, before they can vote.

Section 7 requires the constitutions and laws of the reorganized States to put all citizens upon an equal footing. If *this section* is ever repealed (so the bill is reported, but surely erroneously), the act is to become void, and the State to lose its right to representation.

Section 8 provides for restoration of the States upon this basis.

It seems to us that section 2 gives up the whole ground. The governments now *de facto* existing at the South are *State* governments, or nothing. They do not pretend to be Territorial governments, and will not act as such. If Congress recognizes them at all, it cannot stop half-way, with any consistency or reason. If they are fit to be trusted with the lives and property of all their citizens, they are fit to be represented in Congress. If they are State governments for any purpose, they have an absolute constitutional right to representation in Congress. Mr. Stevens cannot adopt Mr. Johnson's premises without also adopting his conclusions.

Section 3 follows the error of section 2, and nullifies the whole bill by leaving it to the discretion of these illegally constituted legislatures to call conventions or not. Mr. Stevens knows perfectly well that they will not stir in the matter, and therefore his whole project resolves itself into one of mere exclusion, which we are deeply convinced is the most dangerous and impracticable of any; liable to be overthrown at any moment, and bringing with its fall the most disastrous results.

Sections 4 and 5 meet with our hearty approval. We fully believe that it is in the lawful power of Congress to provide for the election of these conventions by universal suffrage, and that this is not merely the most expedient method, but the only one that can legally be adopted. The whole people have a right to participate in the organization of government by means of a convention, and Mr. Stevens does well to recognize this doctrine.

Section 6 is not in itself unjust, and, if enacted two or three years ago, would have been effectual. Indeed, there is strong reason to believe that it is merely declaratory of what would have been law and fact but for a circumstance which we shall presently mention. The United States have always recognized the right of expatriation and renunciation of citizenship. Every one who took the oath of allegiance to the so-called Confederate States necessarily renounced his allegiance to the United States; and although we did not recognize the Confederacy as a government we clearly did as a belligerent. Is it essential to a renunciation of citizenship that the citizen should transfer himself to a nation recognized by us? If so, then no American citizen could, prior to 1862, have lost his citizenship here by becoming a citizen of Hayti, St. Domingo, or Liberia. We do not think this could be so. We believe that it is in the power of every American to give up his birthright by any formal act indicating his intention to abandon his citizenship here in favor of citizenship in, or subjection to, any other power existing in fact, though not in law.

If this theory is correct, it is clear that the President's pardon does not restore citizenship, since it was not forfeited as a penalty for crime, but given up by the voluntary action of those who took the oath in question. Nor would there be any injustice in requiring those who had thus thrown away their rights to reclaim them by the ordinary course of naturalization. The more difficult question is, whether Congress has not already restored all these men by the passage of the civil rights act. That statute declares all persons to be citizens of the United States who, being born within their limits, were not, at the time of its enactment, subjects of any foreign power. The "Confederate States" having ceased to exist in any form, even as a belligerent, long before the passage of the civil rights bill, it is plain that the Southern people come within its terms. Nevertheless, under the well-known rule of law that such general expressions in a statute are not to be literally construed so as to extend to cases not contemplated by the legislature (People *v.* Utica Ins. Co., 15 Johns. 358; Jackson *v.* Collins, 3 Cow. 89; 1 Kent Com. 462), it may be doubted whether the civil rights law has so broad an effect. If it has, then deserters from the army have regained their citizenship, of which they were deprived by law without any pardoning process.

The great defect of Mr. Stevens's scheme is that it is not self-operative. We suggest to him that it would be well to provide unconditionally for the election of conventions under his bill, instead of leaving it to the late rebels to say whether they shall or shall not be called. Congress did not make the restoration of the Federal control over these States to depend upon the will of the rebels. Why should it give them an option as to the restoration of local government? The Constitution is peremptory in requiring Congress to guarantee a republican government to every State, and does not make this duty dependent upon the wishes of the State itself. Even if a majority in Rhode Island preferred a monarchical form of government, Congress could not tolerate it; nor would it fulfil its duty by simply shutting Rhode Island out of the Capitol until it was disposed to accept a republican government. Congress is bound to set the machinery of government in motion, wherever it has been stopped, without asking leave from any subordinate power. Especially has it no right to make the performance of its duty dependent upon the choice of a body illegally constituted and destitute of any lawful authority.

Of course, this proposition of Mr. Stevens has drawn abundant denunciation upon him. The Albany *Evening Journal* is especially severe in its expressions. It may have to recant these, as it has recanted others of its hastily formed judgments. The measure is really more moderate and fair than could have been expected from its author. It approaches nearer to a permanent solution of the problem which has so long tasked the wisdom of our rulers, than any proposition now pending; and our only fear is that Congress will not have the courage to take it up, modify it in detail, and pass it over the usual veto.

PARDONS AND MORALITY.

The wholesale way in which the President and many governors have of late been pardoning criminals, and the efforts which are now being made in this city by some of its most prominent professional and commercial men to procure the release of one of its most notorious offenders, before he has suffered the fifth part of a very light sentence, prove either that the public horror of crime is diminishing, or that some very extraordinary delusions with regard to the nature and object of legal punishment are gaining ground. We do not attach much importance to the fact that worthy clergymen and worthy merchants are found in abundance to attach their signatures to petitions for the pardon of anybody who has strong social claims on their sympathy. A man must be made of sterner stuff than most of us can boast to tell his friend or his parishioner that he will do nothing to aid him in restoring to his home a son or brother who has, in a fatal moment, broken the law, and for whose sincere and hearty repentance a troop of agonized relatives stand ready to vouch. The very same reason which renders it so difficult for many excellent persons to resist an application

to sign a petition for pardon in such cases, renders it a thankless and ungenerous task for the press to criticise their course. And we should, perhaps, hesitate about criticising if the movement to which we allude were frankly and openly based on the claims of private friendship. To any clergyman or merchant who says candidly he wants this young man's release because he was his friend or the friend of his family, there is little to be said. Something must be forgiven to personal sympathy or affection. But the pardon of which we are now speaking is sought by great numbers on whom the criminal had no personal claims whatever; the petition has been so numerously and respectably signed as to make the arguments by which it is supported and by which persons are induced to affix their names to it, wear the appearance of an expression of the general sentiment, and these arguments we hold to be opposed to all sound notions of legal and moral responsibility, and of the object of legal punishment, and so well calculated to blunt the moral perceptions of the young, and ignorant, and poor, that we cannot but ask the public to stamp them with its hearty reprobation.

That a criminal is reformed is not of itself a good reason for releasing him from prison before his sentence has expired, even if there were any infallible signs by which the reality of the reformation could be ascertained, because this is not the principal object of his imprisonment. The main object of putting him in jail is to prevent others, who are exposed to like temptations with him, from committing like crimes, and, of course, nobody would be deterred from committing crimes by sentences which are not carried out. If prisons are merely reformatories, let us say so frankly, treat the unfortunates who are sent there with respect, and liberate all who behave well for a few months. In the present instance it is proposed to single out one criminal, treat his imprisonment as merely a sort of *retraite* to give him leisure for repentance, take his own professions of sorrow as proof of his reformation, and turn him loose, leaving his poorer and more friendless companions behind to weep, and pray, and petition in vain. We say deliberately that any clergyman or merchant who uses his influence to secure the pardon of a rich and well-connected criminal on the ground of his reformation, is bound to extend the same assistance to all others similarly situated. In God's eyes the repentance of the meanest and poorest prisoner in Sing Sing is just as sacred, and is just as expiatory, as that of Edgar Ketchum, and if earthly justice is, like Divine justice, to be satisfied with repentance, it must, like it also, be no respecter of persons. There are, no doubt, in the State prison at this moment dozens whose horror of their own transgressions is just as sincere as Ketchum's, and if this constitutes a fair claim for pardon, it would be monstrous for the governor to grant it to him without granting it to them also, and it is, let us add, monstrous for intelligent and patriotic men to ask it for him. No greater calamity can befall any country, and above all a country like ours, than the creation of one law for the rich and another for the poor, and if the strongest social and political influences are used to procure the remission of a rich man's sentence, on grounds which poor criminals might urge with equal force, but would urge in vain, the sentence itself is a mockery and a snare. Nobody is taken in, and nobody reassured, by the pomp and circumstance and solemnity of the trial; the real test of equality before the law is to be found in the manner in which the condemnation is carried out.

The terror of punishment lies in its certainty. Neither hanging nor breaking on the wheel has been found to produce much impression on the evil-minded if there was no certainty of the punishment being inflicted. This has been the experience of nearly all countries. Make your punishments sure, and you may diminish them by one-half. Make detection rare, convictions difficult, and pardons frequent, and crime is sure to increase. This is precisely what we are doing, and crime *is* on the increase amongst us. Our courts and police are daily falling into greater contempt. The revelations just made by the New York Prison Association of the state of things which prevails in the central parts of this State read like a chapter from the records of Italian brigandage. In England out of 100 indicted 75 are convicted; with us, 25. In this city, owing to the rapid increase of speculation and the spirit of gambling by which the commercial community is every year more and more pervaded, and the frightful eagerness of the race for wealth, defalcations and breaches of trust are becoming more and more numerous, and the impunity which attends them greater and greater, and the condition of our courts and the condition of our public sentiment are revealed by the general belief that, when a wealthy offender or an offender with wealthy connections is caught in the meshes of the law, he will escape somehow, and that even-handed justice will not be done.

Moreover, the indications of repentance and reformation in criminals are very delusive. There is but one man in a thousand competent to judge of their genuineness. The way in which chaplains and philanthropists are imposed on every year by sham penitents is amongst the saddest revelations of prison life. Every man is, of course, sorry after he finds himself in the State prison for doing the thing that brought him there, and the better the position he has lost by his crime, the heartier his grief is likely to be. This is doubtless good, as far as it goes. It is the lowest form of repentance; but it is, nevertheless, the basis on which the highest form of repentance must rest—that repentance which is dictated not by the prison dress, or the hard bed, or the coarse fare, or the remembrance of the champagne, green peas, and ice cream of other days, but by sincere and hearty detestation of his crime as an injury to society and a sin against God. But this last kind of repentance we hold to be the only kind which entitles a criminal to have the prison doors thrown open to him, and its sincerity is to be ascertained not by a few months of decent behavior—nothing can be easier than this to a man brought up decently—nor yet by lip protestations, but by long years of self-denial, of uprightness, and fidelity. It may be often hard that a proof so severe as this should be exacted, but we hold that the highest interests of society demand that every young man should know and see that flagrant departures from the paths of honesty can only be atoned for in this way; that, as the offence is heinous, the labor of expiation has to be tremendous. There seems, if we are to judge by the efforts which are made to secure the escape of educated criminals, by men whom we cannot suspect of indifference to the moral results of their acts, to be a vague belief prevalent amongst us that education and social position diminish instead of increasing moral and legal responsibility—that crimes committed by a man on whose training society has lavished all its resources, and whom Providence has raised far above want, is somehow less heinous than crimes committed by people to whom all light has been denied, and whose life has been one long struggle with the sharpest temptation. If there be a doctrine to which the devil can fairly lay claim, and the spread of which might well make society tremble, it is certainly this one, and yet every name which is put to a petition for the pardon of well-bred offenders lends it, at least, indirect sanction.

CONCERNING DISINFECTANTS.

[SECOND ARTICLE.]

A GLANCE at the history of our knowledge of the action and value of the porous disinfectants reveals a remarkable medley of information concerning practices which have originated perhaps almost as much in instinct as in reason. Most of the carnivorous animals bury their excrements; the Jews were enjoined to do likewise during the pilgrimage from Egypt (Deuteronomy xxiii. 13); and one of the most recent among the sanitary inventions which have been brought forward in England is little more than an adaptation and enlargement of the same idea. In place of the fixtures of the usual water-closet, a somewhat larger set of pipes, suitable for the transmission of powdered earth, instead of water, are provided, and connected with a reservoir of dry earth above. Upon opening a valve, this earth will flow down precisely as if it were water, and will finally pass into another large reservoir below, whence it can be removed from time to time, as occasion may require. The value of this system, as a substitute for the ordinary water-closet in localities where water is scarce, is self-evident. It may safely be predicted that it will speedily come into use in the inland districts of this country as well as of England.

Again, many of the carnivora, dogs and foxes for example, preserve their surplus stores of food by covering them with earth, and it is recorded that the meat of certain offensive animals is sometimes rendered fit for the use of man by a similar method. The method of purification by burial of garments upon which the fetor of the skunk has fallen, is an inheritance which has come down to our suburban friends from the American Indians. The sweetening of water by charcoal, and the charring of the interior of ships' casks to this end, are very ancient practices, though it is only since the publication of Stenhouse's researches that the purifying power of charcoal has been utilized in a general and methodical way. The habit of placing pan

of recently ignited, powdered charcoal in the wards of hospitals, and in other apartments pervaded with foul effluvia, is one which has been but recently acquired. So, too, with the use of charcoal respirators, and of charcoal air-filters for drains. These filters, by the way, have been employed upon the large scale for ventilating sewers in several European cities. Sieves filled with small fragments of charcoal are placed across the air-vents of the sewer, and the offensive gases are absorbed and destroyed by the charcoal, as the current of air from below passes out into the atmosphere. There appears to be, practically, no limit to the oxidizing action of the charcoal; or, in other words, to the endurance of these air-filters, provided only they be kept dry.

The efficiency of charcoal as a disinfectant is well shown by the common laboratory experiment, in which the carcass of some small animal, as a rat, is placed in a shallow vessel of basket-work and surrounded to the depth of an inch or two with powdered bone-black. Under these circumstances the flesh of the animal will gradually waste away and be consumed, but there will be neither foul smell nor noxious exhalations. After a time it will be found that all putrescible portions of the animal have disappeared, and that nothing is left but a mass of hair and bones. The only odor which can be detected while this process of decay is going on is that of ammonia gas—a wholesome smell to which there is no objection. If it were thought desirable, the ammonia could easily be absorbed by an acid and all odor be thus prevented. In all these cases the purifying action depends upon oxidation, upon the burning up of the offensive gases as fast as they are formed. Neither charcoal nor earth should be regarded as preservatives proper to prevent decay, but as true disinfectants or destroyers of infectious matter.

Another popular belief, the grounds of which have never yet been fully explained, is in the efficacy of smoke as a purifying agent. That this belief is wide-spread was shown by the discussions which arose a few years since, just before the passage of the bill which has compelled the manufacturing establishments of London to burn up the smoke of their furnace fires in lieu of throwing it into the air. There was at that time no end to protestations against the law, on the plea that pestilences would thenceforth have full swing, and that the mortality of the city would assuredly increase. It does not as yet appear that either of these predictions has been in any sense fulfilled in consequence of the very partial relief from smoke which has latterly been accorded to London. But the prejudice in favor of smoke is after all not altogether devoid of scientific support. The black, floating particles, the flakes of soot, which are so annoying in English cities and some of our Western, are really pieces of charcoal, as well capable of absorbing and destroying infectious matter as any of the other varieties of charcoal. It is believed by some that there is produced as one of the results of every process of combustion a certain portion of one or both of the active modifications of oxygen, which would of course act as powerful disinfecting agents. Moreover, there are evolved during the combustion of many substances large quantities of terebinthine or tarry matter, which would be as valuable as tar for purifying purposes. The practice of burning incense in churches, which appears to have been originally adopted for the purpose of concealing the stench of crowds or the unpleasant odors attendant upon sacrificial and burial rites, was in this view really something more than a mere cloak to mask offensive smells. When frankincense and the other gum-resins are burned, there are evolved large quantities of quasi-volatile matter, analogous to tar or turpentine, and there can be little question as to the efficiency as disinfectants of these so-called perfumes.

Special sorts of smoke have had their advocates. The sulphurous fumes which arise from smelting houses in the course of certain metallurgical operations have often been lauded. The distinguished Professor Breithaupt, of Freiberg, came forward as their champion so long ago as 1831. In one of the scientific journals of the period he published an elaborate plan for protecting cities against the cholera by means of smoke charged with sulphurous acid. His proposition was, that large fires should be kept burning in all the public squares, and that iron pyrites should be thrown upon these as often as might be necessary in order to keep the atmosphere of the city charged with sulphurous fumes. To most men this remedy would certainly seem to be far worse than the disease. In simple justice, then, to the worthy professor, there should be quoted from his memoir enough to exhibit the drift of its argument: "It is a fact well known to metallurgists that those persons who dwell in the immediate vicinity of smelt works, in which the sulphides of silver, lead, or copper are reduced to the metallic state, are remarkably exempt from the attacks of contagious disease. As regards the smelting houses at Freiberg, this is already sufficiently well known. At Fahlun, in Sweden, another city surrounded by smelt-works, no epidemic has ever prevailed. It has been shown, moreover, that, when the yellow fever visited Andalusia, the district of Riotinto, near Seville, where copper-smelting is practised, remained entirely free from the contagion, and afforded a safe asylum to the soldiers who were transferred thither." From these premises Professor Breithaupt naturally enough infers that the gases evolved during the roasting and smelting of sulphurated ores are efficient disinfecting agents. It does not appear that his view has ever been disproved. On the contrary, only a few months have passed since the French Academy was invited to bear witness to the merit of a plan similar in principle to that of Breithaupt, and dependent upon the same train of reasoning. It is known, for the rest, that sulphurous acid is a powerful disinfecting agent, though the mode of its action is not very well understood.

Classifying roughly, it may be said that there are three general methods of disinfection. In the first place there are agents which destroy by simple *dédoublement*, or demolition. Heat, for example, may often act in this way, and there are few more convenient methods of purifying infected clothing than the common processes of boiling or baking. Then there are agents which destroy chemically, by oxidation, and it is in this class that most of the approved disinfectants must be included. The ozone producers, such as phosphorus and the permanganates; chlorine, bromine, iodine, and their compounds; nitrous and nitric acids, and the nitrates of the heavy metals, all fall into this category. Charcoal and similar porous substances must be placed in the same list, as has been already stated. Next come the simple antiseptics or arresters of decay. In this list may be placed extreme cold, tannic acid, and various metallic salts, as of mercury, copper, and zinc. The applicability of the members of this class is by no means so general as that of most of the substances previously mentioned, since their field of action is of comparatively limited extent. Several of the chemical agents comprised in this class appear to act simply by combining with organic substances so as to form imputrescible compounds. Finally, some of the most efficient agents of all are those which, like tar and turpentine, act both by virtue of antiseptic and of oxidizing power.

THE COOPER UNION.

An evening walk up Broadway and the Bowery may, perhaps, do as much to dishearten a student of human nature and a believer in human perfectibility as to cheer him. But if his walk on the evening of Wednesday last led any such student into the Cooper Institute he very likely came away full of encouragement and reasonable hope. We are speaking now not of the lower floor of that building on the night in question, where Mr. Greeley was addressing a great audience in favor of our excise law; but of the upper rooms, where a smaller meeting was perhaps doing something more, and perhaps doing it in a better way, to put down vice and ignorance and their consequent degradation. The Cooper Union for the Advancement of Science and Art was holding its seventh annual meeting, and the friends and relatives of the pupils were present to see what had been done during the year.

If the visitor was in no hurry to get into the exhibition rooms, he might stop by the way and wait awhile in the library, saving himself from the wear and tear of temper, and not impossible loss of it, incident to climbing crowded stairways and squeezing along entries with ladies' dresses just under his feet. The reading-room is not very well lined with books, but the stands for magazines and files of newspapers seem exceedingly well supplied. The room is lofty and spacious, and needs be large, for it is free to all the city. And apparently to all papers as well as to all men. The *Jewish Messenger* is there not far from *The Advent Herald;* the *Metropolitan Record* is taken, and there are three copies of the *Tribune* always on hand and one of the *Anti-Slavery Standard;* the *Saturday Review*, the *Spectator*, the *Banner of Light*, the *Builder*, the *Billiard Cue*, the *Economist*, *Frank Leslie's Lady's Magazine*, all find readers, and for those who cannot read English there are journals in French and German and Italian. In the first year of its existence this reading-room was visited by more than two hundred thousand people; the number benefited by it in this seventh year we are not able to report, but probably it exceeds a quarter of a million. The room, as we have said, is absolutely free; everybody is made welcome who is willing to take his hat off and behave with propriety while he reads his paper. It is meant for poor men's use and pleasure. Going up-stairs after awhile, one finds in the appearance of the throng of visitors indications that the character of the schools is like that of the library. The audience is not altogether exclusive, but a little mixed; there is a sprinkling of unfashionable bonnets among the French chips; some of the delighted elderly couples whom a pupil leads over to a particular specimen of wood engraving, or a colored photograph, or crayon drawing, are evidently people not rich. Dr. Holmes's young man John who, Dr. Holmes has noticed, sets the right elbow joint of his young woman in the hollow of his left arm, and so convoys her to places of public amusement, is to be seen doing pretty much the same

thing here, wearing his hat the while, and he, after the young lady has said, That's mine, may be heard enquiring, Hay? view of Ajax drawn from a cast? what's the idea? And, a pleasanter sight still, in the rooms where are kept the specimens of mechanical drawing—screws, steam-engines, cog-wheels, with accompanying figures of preliminary cycloids and epicycloids—there is more than one man who looks like a mechanic, thirty-five or forty years old, perhaps, who finds his own name, and exhibits such a locomotive, or such a bridge, or a book full of the figures of trigonometry or analytical geometry to admiring women that look like mechanics' wives, or men who look like fellow-workmen.

Till eleven o'clock the crowd, pupils and teachers and friends, walks round and round in the gallery, looking up at the pictures on the wall and down over the rails into the reading-room below, where the band is playing. Then the building is closed and everybody goes home, voting the annual exhibition very good indeed.

Of course, at such a gathering it was easier to get hints than definite knowledge as to the measure of success which has attended the founder's benevolent efforts. What his plan was and how long it was cherished is generally known. He himself had suffered from the deficiencies of his early education. By chance he learned that in Paris the poorest boys could receive a gratuitous course of instruction in the Polytechnic School, and he at once resolved to give a free polytechnic school to the youth of New York. Thirty years afterwards he found himself wealthy enough to carry his intention into effect, and erected the Cooper Institute building, which, a gift to the public of six hundred and thirty thousand dollars, he two years ago gave wholly into the hands of an incorporated board of trustees, by whom the property is henceforth to be held. Its income in rents is about thirty thousand dollars, the expenses of the schools are rather less than that sum, so that the first requisite of a respectable institution the Institute now possesses—it pays its way. The schools already established are of two kinds. There is the School of Science and Art for Men, which holds its sessions at night, and gives instruction in natural philosophy, chemistry, and a very complete course of study in mathematics. In conjunction with this mathematical course there is instruction in drawing from life and from copy, in perspective, and in architectural and mechanical drawing. The pupil in this school must be sixteen years old, of respectable character, and have a tolerable knowledge of the rudiments of an English education. At the end of five academical years, which would be at the end of two years and a half of time, he is graduated. Not many, it is found, persevere to the end of so severe a course of study; but the number of those who enter upon it and pursue it far enough to derive no inconsiderable advantage from it is very large. There have been sixteen hundred scholars during the year just closed. The graduates are only four.

The other important school is the School of Design for Women. All who will may enter, and no one is afterwards turned out who shows an aptitude for any branch of drawing, or for painting, or can be taught to color photographs, to engrave upon wood or copper, to design patterns for printed goods and for manufactured wares of any kind. Young ladies are prepared for the teaching of these branches, and another class is composed of pupils who wish to apply their knowledge of art to practical uses. Then there are some who are called amateurs, and these are required to pay for their tuition. This is a day school, and its pupils number between two and three hundred, of whom nearly half are young ladies fitting themselves for teachers.

To speak in criticism of the literary and debating society, with its professor of oratory and debate, would be ungraciously looking a gift-horse in the mouth; we say nothing about it nor about the music class, except that both are popular, and the latter is probably useful to the young ladies just spoken of, who, being school-teachers, are bound to know something of everything. The library, with its six or seven hundred daily visitors, can be mentioned only with praise, doing, as it does, so much to form and foster and gratify that taste which to so many young men in great cities has been their best defence and preservative from vicious excesses, and which, one may venture to say, has been to all Christendom, in these last three centuries, the fountain of more and more innocent pleasure than has been drawn from any human source beside. The greatest excellence and usefulness which it is hoped and expected the schools will some time attain they have not attained as yet. They have given to some dozen or so of poor men such a mathematical education as puts them above all our graduates of American colleges except the few first men of each year. And the pupil of the institute gets a passably good course of chemistry and is well instructed in the application of mathematics to mechanical and architectural drawing.

But, besides these benefits conferred upon a dozen men whose ability and patient desire of improvement have led them through five laborious years of night schooling, there are the benefits conferred on more than a dozen hundreds of young men who, for three months, or six months, or a year, have attended some of the recitations and lectures, or had a few drawing lessons, and have carried away more or less knowledge of trigonometry, or algebra, or chemistry, which otherwise they would never have possessed. Probably it is only a smattering of learning that most of them get. Most of them are not students well trained, and while they study are also busy earning a livelihood. For various reasons, about six hundred out of every sixteen hundred drop off at the end of each term. Many, too, only want a little special knowledge on some particular subject, as, for instance, those thirty turners and carvers who, in 1864, took lessons in free-hand drawing and in nothing else, or those machinists of whom, while four studied free-hand and two architectural drawing, no less than one hundred and twenty-eight took up mechanical drawing. Thus the sip of the Pierian spring may have a considerable practical value. But, for that matter, smattering seems to be, nowadays, not so contemptuously thought of as formerly. To drink deep, speaking relatively, is now altogether impossible, the volume, if not the depth, of the waters is so vastly increased, and the men of science bore us so many wells. Only a very great donkey could hope to drink up all. So, since in the case of any single one it is only a taste which is possible, to take a taste of each seems wise, and about its being pleasant there are not two opinions.

If, then, this magnificent gift to the city may need much improvement as a polytechnic school, the city will no less be willing to return its gratitude for the great work which the Institute performs in making better educated and better and happier a great number of the citizens. Thus, after all, it strikes more closely at the root of those difficulties and evils of the social system on whose removal the benevolent giver's heart is set, than if it more fully and successfully carried out his specific plan. In this aspect of it none of the special departments will be looked upon with more interest than the Women's School of Design. The display at the exhibition of patterns in various kinds of manufacturing arts, of specimens of engraving on wood and copper, of portrait coloring, of ornamental lettering, was not a very large one, but it was large enough to show that one of the most important and importunate social problems—how to get not decent wages, but decent work at any sort of wages, for a very helpless class of laborers whose number increases—a problem which society is beginning to discuss earnestly, this school is beginning to find a practical solution for. It is a field of usefulness which may and will be cultivated more extensively, and everybody will hope that the school may before very long number more than two hundred and fifty female pupils and that the school mistresses may not be, as now, in a majority.

DRESDEN CHINA.

THE time spent by the tourist in Germany in an excursion to the little town of Meissen is time well spent. Not only is there to be seen along the Elbe from Dresden the finest scenery north of the Alps—the "Saxon Switzerland," it is called—but there is also at Meissen itself the highest development of the potter's art outside of the Orient, perhaps in the world, the manufactory of the famous Dresden china.

At an early hour in the morning one takes a boat at Dresden, a queer, narrow, sharp affair, such as ply in these swift, crooked streams, and in two hours reaches his destination. The boats on the Elbe are like our American canal-boats, only much longer and modelled after a pike instead of a perch. They shoot through the water at an amazing rate. As in so many other instances, here also the Germans entirely reverse the American methods, and unlade and receive passengers and freight aft instead of forward, landing with the bow out in the stream.

We are reminded here, as on all German rivers, that James Watt was an Englishman, and that England has dominion over steam as well as over water. Hear the words of command which the captain sends down through the speaking-trumpet to the engineer: "Vorwärts," "Stoppe," "Backwärts," "Halte." These are the stock forms of command, two of them German and two of them unmistakably English, learned from English engineers sent here to teach the use of the engine years ago, and handed down by constant use almost unchanged.

We meet and overtake scores of long scows heavily loaded with timber and produce, tediously propelled by poles, with the aid of occasional flurries of wind. One huge vessel ascending the stream is pulled by a rope attached to its mainmast, seventy-five feet above the water, and reaching eight hundred feet up stream. Ten men are tugging at it, each leaning heavily against a wide band that passes over one shoulder and under the other, keeping time together in a lazy swing back and forth, supporting themselves by a stick held in both hands. Put an ass in their place with a

crabbed curmudgeon for a driver, and we should have looked on the scow for Horace going to Brundusium. The spectacle is a common one.

The buildings in which the famous porcelain is made are situated in a narrow, deep valley, a hundred rods from the Elbe, and are built in the form of a quadrangle, and finely stuccoed. You register your name not far beneath that of George B. McClellan, and pay thirty cents admission fee, which procures you a guide who speaks indifferent English.

The porcelain earth is found in mines near Meissen, and is called kaolin. It is of dingy white color, and contains seventy-five per cent. of sand, which has all to be washed out. The earth is mixed with water and passes through numerous vats, sieves, and troughs in which the sand is precipitated, the water containing the pure earth in solution being drained off, and the earth settling to the bottom. It is then packed in small sacks and slightly pressed until it hardens somewhat, when the sacks are removed and the lumps thrown into large boxes, where they must remain six months. It is then ready to be mixed with the other ingredients. These are a pure quality of quartz from Bohemia and feldspar from Norway, which are ground many times under water to reduce them to perfect fineness. Ask the guide in what proportions these are mixed with the earth, he gives his shoulders the peculiar German shrug, and solemnly informs you that it is a profound secret. It is the only secret in the whole process. When the doughy mass is ready to be moulded, it is singularly tough, and is of a light dun color, which disappears entirely under a white heat.

Most solid articles, such as busts, crucifixes, animals, shrubs, and leaves are cast in ordinary moulds of plaster of Paris. The minuteness of the division of the pieces is very great; for instance, to cast a statue, each arm, hand, leg, foot, and the head must be a separate casting. There are moulds accumulated in the buildings to the weight of thousands of tons. Round dishes are turned on an ordinary wheel; all other articles are moulded by hand. Lace and filigree work is made by girls, and is formed drop by drop from a pointed stick, each drop being no larger than half a pin-head. The articles are baked in pans of fire-clay, in huge ovens three stories in height. In the first baking, they are set in the second and third stories, which are brought only to a red heat; afterwards in the lower one, where the heat is white. Every baking lasts twenty-four hours. After the first baking, all the parts of the vessels that are to be blue or green are painted with preparations of cobalt and chrome green respectively. They are then dipped in the glazing, which is a thin solution of feldspar, quartz, lime, and old china ground fine. So porous is the material that in two seconds after it is out of the liquid it is dry, though a sufficient deposit has been left to conceal all the painting, which only re-appears after the second baking. Those portions of "biscuit china" which are unglazed are covered, when dipped in the liquid, with a paint which prevents the glazing from adhering, but remains colorless.

After the second baking all those vessels that are simple in their decorations and require few colors, receive their finishing coats, and are baked a third and last time. Others, more elegant and more complicated, are baked a fourth, fifth, and even sixth time, not to harden the vessel still more, but to melt the paints and allow the artist to give it additional finishing touches. All the paints are made of metals dissolved in their respective chemical solvents and applied with ordinary fine brushes. The yellow, for instance, is produced by gold which is twenty-four carats fine, made of ducats, and dissolved in the sulphate of iron. The heat of the furnace is so intense as to melt all these metals and give them a lustre, except gold and silver, which come forth dull as they entered, and are polished with agates. If the article has escaped cracking by heat, it is now finished and ready for market.

The loss from cracking is very great. Three-fifths of all the vessels are spoiled in the baking, many of them splitting in the fifth and sixth heating, after a vast amount of labor has been expended on them. This adds much to the cost of porcelain. Every piece shrinks one-fifth in heating and yet remains of the same weight throughout. All the laborers work by the piece, so that whatever is broken after the first heating they receive no pay for unless it is broken in heating.

There are over four hundred workmen employed in the establishment, among whom are a large number of girls and women. Great steadiness of nerve and accuracy of sight are required, quite incompatible with drinking habits. In every department except that where the glazing is conducted, the workmen are not exposed to injurious vapors, and consequently have good health and look fresh. At least one-fifth of them have impaired their eyes; though they do no work after night, they are obliged to use shades or glasses. The greatest quietness prevails throughout, amid perfect cheerfulness and apparent contentment. Every workman is allowed a whole window, to which he sits very close, and you will not notice a window whether belonging to man or woman, that is not filled with pot-plants or climbing vines. Every workman is first drilled three years in exercises of drawing, moulding, and a general study of forms and colors, then passes through an apprenticeship of six years, after which he proceeds by gradual promotion from the lowest to the highest grade in his department. Promotions are not made from one department to another, each one giving his exclusive attention from first to last either to painting, moulding, or baking. Even the best artists get no more than seventy-five thalers per month (about the same number of dollars in our present currency). There are painters here whose talent is manifestly of a high order. Passing through their rooms we see the walls hung with classical engravings, and scattered about are portfolios of the same, from Italy, from France, from all parts of Germany, ancient and modern, and after the greatest masters, such as Raphael, Guido, Durer, Holbein, Cranach, etc. Debate with them about the proper form of Nereids, the length of Neptune's trident, the breadth of Achilles' beard, or the folds of Tully's toga, and they may put us to confusion. Their workmanship, too, bespeaks a skill of no mean sort; as every one knows who has seen the exquisite portraits and the delicate, almost gossamer, tracery of the Dresden china.

There are now in preparation, and have been for months, several magnificent vases and some representations of ancient mythology and Grecian history for the approaching World's Fair at Paris. One beautiful vase, on which one of the best artists had labored five months, perfecting a series of portraits representing a triumphal march of Alexander the Great, was broken by the heat. With indefatigable perseverance he has begun another and brought it within two perilous months of completion. In the most favorable conditions the length of time required to complete the finest work is very great. First, the clay lies in lumps, "fermenting," six months; then a fine vase will require seven weeks in which to be moulded, to which add four months for baking and painting.

LIFE OF EMANUEL SWEDENBORG.

Together with a brief Synopsis of his Writings, both Philosophical and Theological. By WILLIAM WHITE. First American edition, with an introduction by Rev. B. F. Barrett. 1 vol. 12mo. $1 50.

MOSAICS OF LIFE.

Illustrations of the various Epochs of Human Life, Betrothal, Wedded Life, Babyhood, Youth, Single Life, Old Age. By MRS. ELIZABETH A. THURSTON. 12mo. $2.

NEW EDITION,

MAY AND DECEMBER.

A Tale of Wedded Life. By MRS. HUBBACK, author of "The Wife's Sister; or, The Forbidden Marriage," etc. 1 vol. 12mo. $1 75.

ROBA DI ROMA.

By WILLIAM W. STORY. 2 vols. 12mo, cloth. $5 00.

The title "Roba di Roma" will be intelligible to every one who has been in Rome. Mr. Millhouse, in his dictionary, defines "Roba" to be "goods, wares, things, articles, property, chattels, estate, stuff, lumber, a robe, gown, dress." Yet this definition, extensive as it is, is inadequate. We have no term so comprehensive in English. "Roba" is everything from rubbish and riff-raff to the most exquisite product of art and nature. This book is filled with "Roba," and I hope that it contains very little "Robaccia," which Mr. Millhouse defines to be "trash, trumpery, and stuff."—*From Preface.*

HIDDEN DEPTHS.

1 vol. 12mo. $1 75.

"This book is not a work of fiction in the ordinary acceptation of the term. If it were, it would be worse than useless, for the 'Hidden Depths' of which it reveals a glimpse are no fit subjects for a romance."—*Preface.*

NEW PHYSIOGNOMY; OR, SIGNS OF CHARACTER

—as manifested through Temperament and External Forms, and especially in the Human Face Divine. With more than 1,000 illustrations. By S. R. WELLS, Editor of the PHRENOLOGICAL JOURNAL. In one volume, handsomely bound, $5. Address FOWLER & WELLS, 389 Broadway, New York.

This work systematizes and shows the scientific basis on which each claim rests. The "signs of character" are minutely elucidated, and so plainly stated as to render them available. It is in the delineation of individual character that the system finds its most useful application. The various races and nations are described. The Teuton, Celt, Scandinavian, Greek, Mongolian, Indian, Patagonian, African, etc., has each his representative. Portraits, in groups, of distinguished persons of ancient and modern times, with biographical sketches and delineations of character, render the work of interest to all. DIVINES, ORATORS, STATESMEN, WARRIORS, ARTISTS, POETS, PHILOSOPHERS, INVENTORS, PUGILISTS, SURGEONS, DISCOVERERS, ACTORS, MUSICIANS, etc., are given. It is an ENCYCLOPÆDIA of biography, acquainting the reader with the career and character, in brief, of many great men and women of the past 1,000 years and of the present—such, for instance, as Aristotle, Julius Cæsar, Shakespeare, Washington, Napoleon, Franklin, Bancroft, Bryant, Longfellow, Barnes, Irving, Rosa Bonheur, Theodosia Burr, Cobden, Bright, Lawrence, Bolivar, Whately, Thackeray, Dow, Knox, Richelieu, Hopper, Buckle, Dickens, Victoria, Wesley, Carlyle, Motley, Mill, Spencer, Guthrie, Thompson, Alexander, etc. Every feature of the book, where practicable, has been illustrated with neat and finely executed engravings. 159 Washington Street, Boston.
639 Broadway, New York.

FINANCIAL REVIEW.

NATION OFFICE, Monday,
June 4, 1866.

THE news from London to May 23 is again unfavorable. Our securities and cotton are both lower, and further failures are taking place both in London and Liverpool. The bank, however, has not yet been compelled to take advantage of the authority to over-issue notes, and the run upon the joint stock banks has ceased.

This news is expected to affect our gold market. Since we last wrote the price has varied from 140½ to 141½. To-day at 3 P. M. the price is 143¼. Exchange continues firm at 111 for sight bills. Sixty-day bills are hard of sale at 109⅛ to 109⅝. The total specie shipment last week was $6,807,907, making $28,659,837 shipped since May 1. It is expected that shipments at the rate of three millions a week will be continued for the present—at all events throughout the current month. Notwithstanding the advance in gold, our exports of produce and merchandise continue to decline. They were only $2,260,000 last week, making $204,319,000 for the fiscal year to date—ten millions more than the export during the corresponding period of 1864–5. On the other hand, our importations of foreign goods continue heavy. Last week they were $7,868,323, which, added to previous reports, gives $282,371,751 for the eleven months ending June 1, an increase of $134,770,276 over the corresponding period of 1864–5. The heavy cotton exports from the Southern ports will, of course, go far toward squaring the account.

Money is again very easy. The Sub-Treasury at this point paid off a large number of debt certificates last week, and thus reduced its balance some $28,000,000, by which sum the banks are the gainers. On Saturday money was freely offered at 6 per cent. to the brokers, and in some instances call loans were made as low as 6 per cent. on Governments.

The stock market continues excited and variable, the chief interest centering in Erie shares. On Saturday morning they were done as high as 63. Since then they have been down to 60. The New York Central clique continue to bull that stock with vigor, and steadily increase their load. It is understood that Commodore Vanderbilt, who for some years has been the heaviest holder of Central, has sold out his stock. Reading has fallen off on sales by the clique to realize profits. Nothing further has transpired with regard to the promised June dividend. Hudson River is firm but neglected. The party in Michigan Southern has not yet succeeded either in inducing the bulls to buy or the bears to sell; the price remains steady. Cleveland and Pittsburgh, after its sudden fall of 16 per cent. in one day, has remained pretty steady. The clique are planning a new combination by which they hope to succeed in selling their stock. Among the lighter fancies, Boston Water Power has been active at a material advance. The upward movement in Canton and Quicksilver appears to have exhausted itself. Governments are generally steady, though on the arrival of each steamer five-twenties give way somewhat.

The following table will show the course of the stock, gold, exchange and money markets since our last issue:

	May 28.	May 31.	June 4.	Advance.	Decline.
United States Sixes of 1881	109	109¼	105¾ ex.int.	....	....
5-20 Bonds, old	102	102	102	....	....
5-20 Bonds of 1865	102	102⅛	102	....	⅛
10-40 Bonds	95¾	95⅞	96	....	⅛
7.30 Notes, second series	102	102⅜	102⅛	....	⅛
New York Central	96	98	98½	½	....
Erie Railway	62½	60⅛	62½	2	....
Hudson River	113⅝	113	110¾	....	2¼
Reading Railroad	111⅛	109¾	108⅝	....	1¼
Michigan Southern	78¾	81	80¼	¾	....
Cleveland and Pittsburgh	93	84	85	1	....
Chicago and North-western	28	28⅜	28¼	....	⅛
" " " Preferred	58½	58	58¾	¼	....
Chicago and Rock Island	93⅛	94	93	....	1
P., Fort Wayne, and Chicago	98	97⅞	96¾	....	1⅛
Canton	59	59¾	60	¼	....
Cumberland	45⅛	45	45¼	¼	....
Mariposa	12	12	12⅛	⅛	....
American Gold	137⅛	139⅞	143¼	3⅛	....
Bankers' Bills on London	109¾	109⅛	109⅛	....	....
Call Loans	7	6	6	....	....

Some attention has lately been directed to the subject of brokers' taxes. By the revenue law, brokers are required to pay a tax of $5 on every 100 shares of stock sold by them for customers. A question arose whether they were liable for the same tax when they sold not for customers, but for themselves. The U. S. Court in Circuit decided that they were not. On appeal, the Supreme Court decided that brokers and bankers doing business as brokers were liable for the tax on sales made for their own account as well as on sales made for account of others, but that bankers doing business exclusively for themselves, and not as brokers for others, were not liable for the tax. So absurd a decision has naturally provoked comment, and the Commissioner of Internal Revenue has, for the present, suspended action on the subject. As the internal revenue law is construed, every broker is obliged to take out a license as a banker. Every one in Wall Street, in fact, is a banker. To evade the tax, therefore, all that a speculator requires is to take out a banker's license and to decline orders on commission. On these terms, under the decision of the Supreme Court, he pays no tax. Thus, at least one-half the sales of stocks made in Wall Street pay nothing to Government. The new law will remedy the evil. Under the bill reported by the House of Representatives, the tax is levied not on the sale but on the delivery of the stocks sold, and, instead of being $5—which was so heavy a tax that it tempted rogues to cheat the Government—it is only $1, which everybody will pay willingly. It is hardly necessary to say that the articles in the *Herald* on this subject are based on such profound ignorance of the question in all its bearings and inspired by such petty malice that they have naturally been treated with contemptuous silence by the parties concerned.

The Erie Railway Company have again escaped bankruptcy by borrowing $3,000,000 of their leading director to pay off pressing liabilities. This will give the concern a respite of one to one and a half years. By New Year 1868 it will again be in desperate circumstances, and the receivership now averted will then probably become unavoidable. The great difficulty with this company has existed from the start; it has been milked dry by parasites and hangers-on, so that it has never, in twenty years, had a dollar which it could fairly call its own. Express companies running over its road have earned 25 to 40 per cent. dividends. Its directors have grown rich. Contractors on the line have grown rich. Ticket and freight agents have grown rich. Nay, even conductors and superintendents of shops and repairs have grown rich. Everybody has fattened except the company, which has grown poorer and poorer every year. It is not too much to say that the road has never earned a dividend since it was first built. Many dividends have been paid; but while the directors paid out money to stockholders with one hand, they borrowed money at ruinous rates with the other. Whatever trifle of profit may have been earned in good years like 1865 was swallowed up by losses on bad years. And it must be remembered that the leeches which have always fed on the Erie Railway have insisted on their meal in hard as in flush times. There was as much leakage in 1858 as in 1865. To make money with a concern representing a capital of nearly $60,000,000 (including losses), especially when the road has many curves, many steep grades, and much track through a sparsely settled country, requires good management and a thorough watchfulness over employees. These the Erie Railway has never had. From first to last its employees have been pecuniarily interested in express companies, which have sucked the life-blood of the concern. Leading officers of the Erie are also the principal owners of the stock of the express companies. And as to a general and thorough system of accountability, the company has never had such. So loosely has the business been transacted under each successive president that the wonder is that the company saved anything out of the general scramble. We confess that we see no chance of any immediate reform. A lower depth for the stock must be found before men of capital will venture to embark their means in the work of cleansing so Augean a stable. There is capacity in this country adequate to the proper management of even so great a concern as the Erie Railway with $60,000,000 of capital; but it will not be called forth until the concern sinks even lower in public esteem than at present, and until the stockholders become aroused to the prospect of an absolute forfeiture of their property.

LIFE AND ACCIDENTS.

THE NATIONAL LIFE

AND

TRAVELLERS' INSURANCE CO.,

243 BROADWAY, NEW YORK,

EDWARD A. JONES, PRESIDENT,

Issues

LIFE POLICIES ON THE PURELY MUTUAL PLAN,

And Ensures Against

ACCIDENTS OF EVERY DESCRIPTION.

FIRST CLASS FIRE INSURANCE

ON THE PARTICIPATION PLAN.

MARKET FIRE INSURANCE COMPANY,

37 WALL STREET, CORNER OF JAUNCEY COURT.

CONDITION OF THE COMPANY.

ABSTRACT OF THE ANNUAL REPORT OF DEC. 31, 1864.

TOTAL ASSETS		$414,729 18
Viz.—Bonds and Mortgages	$134,672 00	
Temporary Loans	92,630 00	
Real Estate	10,000 00	
100 Shares Mer. Ex. Bank	5,000 00	
Government Sec., value	144,514 00	
Cash on hand	18,042 34	
Interest due	3,085 58	
Premiums due	6,785 26	
PRESENT LIABILITIES		$15,995
NET SURPLUS		198,733 26

This Company will continue, as heretofore, to insure respectable parties against

DISASTER BY FIRE

At fair and remunerating rates; extending, according to the terms on its Policies, the advantage of the

PARTICIPATION PLAN OF THE COMPANY,

pursued by it for several years past, with such great success and popularity, and profit to its customers: whereby

(75) SEVENTY-FIVE PER CENT. (75)

of the Profits, instead of being withdrawn from the Company in Dividends to Stockholders, is invested as a "SCRIP FUND," and held for greater protection of its Policyholders; and Scrip, bearing interest, is issued to Customers therefor: thus, IN THIS COMPANY, those who furnish the business, AND PAY THE PREMIUMS, derive the largest share of advantages; and when the accumulations of the SCRIP FUND shall exceed

FIVE HUNDRED THOUSAND DOLLARS,

the excess will be applied to PAY OFF the Scrip IN CASH in the order of its issue.

☞ The liberal and prompt adjustment of Claims for Loss, WHEN FAIR AND SQUARE, is a specialty with this Company.

NOTE.—This Company does not insure on the hazards of RIVER, LAKE, or INLAND NAVIGATION; confining itself strictly to a legitimate FIRE INSURANCE BUSINESS.

ASHER TAYLOR, President.
H. P. FREEMAN, Secretary.

OFFICE OF THE ATLANTIC MUTUAL INSURANCE CO.,
New York, January 27, 1866.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not detracting in the slightest degree from its many positive advantages, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fulness, prolongation, and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

Make Your Own Soap with B. T. BABBITT'S Potash, in tin cans, 70 Washington Street, New York. Pure Concentrated Pota-h or Ready Soap Maker. Warranted double the strength of common Potash, and superior to any other saponifier or lye in the market. Put up in cans of one pound, two pounds, three pounds, six pounds, and twelve pounds, with full directions in English and German for making Hard and Soft Soap. One pound will make fifteen gallons of Soft Soap. No lime is required. Consumers will find this the cheapest Potash in market.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

Topics of the Day.

The two senators from Wisconsin engaged in debate on Wednesday upon the question of reconstruction. Mr. Howe thought it a rather singular coincidence that Mr. Doolittle's political opinions and the political opinions which bore the highest market value were always the same. In 1856 he abandoned the Democratic party; before that he had abandoned the Free Soil party; now, in 1866, he had abandoned the Union party. These remarks, however, were explained away, if not explained; they were intended in a Pickwickian sense, as it afterwards appeared, and had as little to do with Mr. Doolittle himself as with the matter under discussion. Mr. Doolittle made such a reply as might have been expected, and stated that he had been instrumental in saving the Union party in Wisconsin last year, although now that party denounced him. But "it was not the first time men had attempted to crucify their Saviour." We have nothing to say, it is not necessary to say anything, upon the tone and language of either speaker's remarks in this little passage of arms. But Mr. Howe made one point which it is well to dissent from: Semmes, he would say, is as well qualified to be a judge in Mobile as the Mobilians are to elect a judge, which may be true in fact and yet be a poor argument on Mr. Howe's side of the question. For Semmes and other prominent rebels to fill high offices would be a great scandal, and we believe that Congressional enactments and constitutional amendments to prevent such a scandal are absolutely right, and right also because eminently politic. But to stop the machinery of local government a moment longer than is absolutely necessary is neither right nor wise. Let the right to choose be recognized and exercised, though the right to choose certain great criminals to posts in the Government which they would have destroyed be denied.

The Washington *Republican* regards it as "one of the mercies of God that a Congress utterly incompetent to finish up the work of restoration" had no opportunity to mar and mismanage the commencement of that work. Speaker Colfax, it says, after the last session neither suggested nor expected an extra session, and set out on a very long pleasure trip across the continent. To this Mr. Colfax has written a reply: he was not Speaker when he began his journey; he did expect an extra session; he spoke on the matter in April last to Mr. Johnson, who made answer that he had not then had time to think about it; at Mr. C.'s request Mr. Stanton promised, and performed the promise, to keep him informed in reference to the expected call. The letter is of interest, as showing what leading Congressmen thought probable and necessary, and because it shows also by direct assertion that Mr. Lincoln, so early as the week after the fall of Richmond, was contemplating an extra session.

The President has at last issued a proclamation against the Fenians. It has no particular value except as a warning to the "Irish Republic" that it will have to keep quiet, and as an intimation that the Government means to enforce the neutrality laws. We say this because the New York *Times* talks of the proclamation as if it were itself law, and says that since its issue Fenianism assumes a new form and is now, in consequence of the proclamation, "an insurrection against the power, authority, and majesty" of our Government. This is what it always was. The only difference the proclamation makes is that it lets Fenians know what the President thinks, which they ought to have known long ago. His liberating John Mitchel, in order that they might send him on a diplomatic mission to Paris, was perhaps as powerful a stimulus as the movement has yet received, and is but tardily atoned for by the proclamation.

On Wednesday morning last, Seguin's Point, at the southern end of Staten Island, was seized with a high hand by Mr. Schultz. He was acting for the Board of Health, the Commissioners of Emigration, and the Quarantine Commissioners, and was at the head of eighty-five policemen, who were supported by the guns of the United States revenue cutter *Cayuga*. On two occasions previously the Staten Islanders have risen in mobs and destroyed quarantine buildings, and this time they met the invading police with violent language; but the State authorities are decidedly in earnest, and the action they have just taken will meet with the almost unanimous approval of the State and of the country. It is so much the whole country's concern that it is not very easy to see why, on legal or other grounds, the State of New Jersey cannot be forced by the Federal Government to allow Sandy Hook, by far the best site for quarantine buildings, to be used for that purpose. But permanent buildings are already begun on West Bank, and for temporary use Seguin's Point will serve very well. At any rate, we shall no longer kill emigrants in the lower bay who have survived the perils of shipwreck and of imprisonment with the plague on the ocean and got over here to their land of promise.

We regret to say that in the article on "Pardons and Morality," in our last issue, we fell into the error of calling Edward B. Ketchum, now in the State prison, whose case we were discussing, *Edgar* Ketchum. The latter happens to be the name of a very different person.

Mr. Councilman White succeeded on Monday in introducing and getting passed a resolution declaring it the duty of the city authorities to take immediate steps towards founding a free public library here in New York. The Board of Aldermen referred the resolution to the Committee on Arts and Sciences, and we understand that the chances are good of its seeing the light again. We have already urged the importance of an institution like that which Boston possesses, and there is no need to repeat the arguments in its favor. We shall be astonished if any opposition is made to it, and we are confident that if the city will but appropriate a piece of ground, a temporary building, a few thousand dollars—anything as a beginning and as an earnest of its interest in the undertaking, there will not be wanting wealthy citizens

to help the library along during their lifetime and to remember it in heir wills. Private libraries, which are now liable to be scattered on the decease of their owners, will then gravitate to the public depository *pro bono publico*. The experiment is not doubtful after the first step which costs.

Our foreign-born fellow-citizens met in mass meeting at Union Square on Monday afternoon to protest against the new excise law. Mr. Friedman, speaking for the Germans, deduced the illegality of the statute from "the principle of individual liberty and responsibility which has given to us much of our intense individualism, self-reliance, etc., etc." Col. Levy went back to Lafayette and Rochambeau to prove the superior claims of Franco-Americans to be relieved from the oppression of the "odious Sunday law." Mayor Hoffman sent a sympathizing letter, which was read and found to contain a quotation against reformers from a "distinguished statesman and orator," and the sensible reminder that while the law in question remained on the statute-book it was the duty of good citizens to obey it.

The Postmaster-General declines to undertake to manœuvre the telegraph lines of the country, ostensibly because he doubts the financial success of the enterprise and its effects on the politics of the country, but also, we trust, because he is conscious of the very imperfect management of his proper department. Of course, the telegraph companies were on hand with figures to show the impracticability of the scheme suggested in Congress, and their very small earnings of four per cent. a year. So for the present we must make what terms we can with these gentlemen.

Judging from the charge delivered by Judge Underwood to the grand jury in Richmond the other day—a violent, unbecoming harangue—the trial of Jefferson Davis, if it took place before him, would neither shed much light on the law of treason nor have much moral weight with the public.

In the North Carolina Convention, last Saturday, it was moved that a committee should proceed to Washington and discover, if possible, what it is that remains to be done before the State can be represented in Congress. This, some delegates thought, would be throwing the noble old North State "at the feet of Thad. Stevens and Charles Sumner," or it would be "stooping to kiss the toe of a political despot," by which title President Johnson is probably meant. But the resolutions passed by a vote of 71 to 20, after some strong speeching in their favor by members from the hill country, and perhaps it is in North Carolina, where the policy of the Executive first became visible, that Congress is to reap the first-fruits of its persistency.

European advices to the 27th of last month represent the assembling of a peace congress at Paris as certain and a speedy outbreak of hostilities as probable. The attitude of the minor states of Germany was not yet fully developed, but the declaration of the King of Würtemberg, at the opening of the Chambers, that, in case justice should not be rendered to Schleswig-Holstein, he, with his allies, would resolutely place himself on the side of right, is indicative of determinations favorable to Austria. In the Federal Diet a motion that Austria and Prussia should be requested to reduce their military establishments to a peace footing was unanimously adopted, the representatives of those powers promising to communicate at the next sitting the conditions on which they were willing to disarm. The representative of Prussia reiterated the demand for the convocation of a German Parliament, as the only means, perhaps, of averting war. The Austrian authorities were taking rigorous measures to prevent the Venetians from aiding their Italian brethren in their expected struggle. The Italian Government, on the other hand, was endeavoring to secure the co-operation of Hungarian and Polish exiles against Austria. Italian volunteers were flocking in thousands to their depots. Garibaldi urged "a truce to dissensions and opinions." Numerous Bourbonists, accused of a conspiracy against the unity of Italy, were arrested at Naples.

CONGRESS.

WASHINGTON, June 6, 1866.

An initial measure of some importance to educational interests throughout the country is at length before the House, in the bill to establish a National Department of Education. The measure proposes no action or interference on the part of the general Government with regard to systems of instruction in the States, and does not even embrace, what to many minds seems the proper function of such a department, the supervision of the education of the freedmen—those wards of the nation. It is simply a proposition to collect and distribute information respecting schools and methods of instruction. This is to be effected through a commissioner of education, to be appointed by the President, and five clerks, to be appointed by the commissioner. Rumor points to Henry Barnard, LL.D., as the probable appointee for this new office, should the bill become a law. But amendments are already offered to cut down the operative force of the proposed bureau to two clerks, to be employed under the direction of the Secretary of the Interior, to effect the objects of the bill.

A step in the right direction has been taken in the passage of the bill to abolish the army rations and other perquisites of military officers, and to pay them fixed salaries. The bill raises the compensation of some grades, and diminishes that of others, but will do away with illicit charges and promote economy.

A similar reform as to the pay of members of Congress is at length initiated, though it will probably fail to become a law immediately.

DIARY.

Monday, June 4.—In the Senate, the constitutional amendment being taken up, Mr. Hendricks moved to amend by including in the basis of representation in the Southern States three-fifths of the freedmen; lost. Mr. Van Winkle offered an amendment, providing that no person not excluded from office by the terms of the third section shall be liable to any disability or penalty for treason after a term of years; lost—yeas, 8; nays, 26.

In the House, the Committee on Appropriations was instructed to report a bill distributing the aggregate pay for mileage of members of Congress in just proportion to the necessary expenses of reaching the seat of Government from their respective districts. Mr. Wilson spoke on reconstruction. The credentials of A. M. West, a representative elect from Mississippi, were referred to the Committee on Reconstruction. The bill to reduce and fix the pay of army officers occupied the rest of the day.

June 5.—In the Senate, Messrs. Poland, Stewart, and Howe made speeches on the constitutional amendment.

In the House, Mr. Garfield reported, from the Select Committee on that subject, a bill to establish a National Department of Education, under the charge of a commissioner and five clerks, to collect facts and statistics and diffuse information on school systems and methods of teaching. The bill was advocated by Mr. Donnelly and opposed by Mr. Rogers. The bill to reduce and fix the pay of army officers was advocated by Messrs. Schenck and Garfield, and opposed by Messrs. Davis and Rogers. The bill was then passed—yeas, 85; nays, 40.

THE FREEDMEN.

Superintendent Eberhart reports 71 schools in operation in Georgia, with 104 teachers and 6,991 pupils. Of the teachers it is noteworthy that 45 are colored, and 51 are residents of the State. Twenty-eight schools and as many teachers are sustained by the freedmen alone. Six new schools were opened during April, and there was an aggregate increase over March of 600 pupils. The popular disposition toward these innovations has ceased to be a subject of special complaint and is quite encouraging.

—Superintendent Tomlinson reports that in April there were 9,184 colored pupils on the school register of South Carolina, showing an average attendance of 6,320, the girls somewhat preponderating. About one-sixth of the whole were learning the alphabet; four-fifths were able to read and spell; 6,111 were pure blacks. The superintendent means, with the aid of native teachers, to keep the schools open all summer, when most of the Northern teachers will return to their homes.

—A Memphis paper justly protests against the usage to which the most respectable colored passengers are subjected on Mississippi steamboats, being compelled to sleep on the floor of the decks, in spite of their having paid the usual fare. It is stated that a colored gentleman has instituted a suit against the owner of a White River packet, for being refused a state-room on the trip from Duvall's Bluff to Memphis.

Notes.

LITERARY.

Some of the pleasantest and most valuable papers elicited by the death of President Lincoln were those from the pen of Mr. F. B. Carpenter, previously known to the public only as a painter, and chiefly for his historical picture of the first reading of the Emancipation Proclamation. The series appeared in the *Independent* and in part in "Hours at Home," and their merits were as universally recognized as those of the canvas. The two, in fact, cannot be separated. Mr. Carpenter's peculiarly intimate relations with Mr. Lincoln while engaged on his professional work, afforded him a rare opportunity of observing a character of whom we shall not soon tire of hearing fresh representations. The eagerness with which the public read, and the favor which they justly accorded to Mr. Carpenter's reminiscences, induced the artist-author to compile them in book-form together with many facts and anecdotes of facts communicated to him from a great variety of sources, and most of which have never yet been published. Messrs. Hurd & Houghton have the volume in press, and will shortly issue it under the title of "Six Months at the White House with Abraham Lincoln."

—Hardly any offence in literature is deserving of as much contempt and reprobation as the too frequent practice of using false quotations from reviews of books to help along the sale of the works. The beginning of one sentence is sometimes joined to the end of another so as to alter entirely the sense of the opinion expressed. This is so common that, except in advertisements by the most honorable publishers, such quotations should be entirely disregarded by persons thinking of buying the book. Two very reputable firms in London have recently got by the ears over a question of this kind. The "Quarterly Review," in the April number, had a very severe article on "Ecce Homo," condemning it as unsound in faith, untrue in fact, and uncritical in style. Messrs. Macmillan, the publishers of "Ecce Homo," thought that no advertisement would be so good as this sweeping condemnation, and accordingly reprinted this sentence from the "Quarterly:" "The shallowest theories and the flimsiest arguments find a ready reception in an empty mind, and their sole strength is in the weakness and credulity of their dupes. Happily there is a vast body of educated men who are better informed." Mr. Murray, the publisher of the "Quarterly Review," complained of this citation on the ground that many persons were led to infer that the "Quarterly Review" had commended "Ecce Homo" as an antidote against "shallow theories" and "flimsy arguments," and he published an advertisement containing the whole passage. Messrs. Macmillan printed a counter advertisement repudiating the charge of "garbling," to the effect that "the first sentence of the extract fully expressed the unfavorable opinion formed by the reviewer; and that, in fact, had it not done so, the object of the publishers in reprinting it would not have been answered." To this statement Mr. Murray replied: "'The first sentence of the extract,' which the publishers of 'Ecce Homo' say 'fully expressed the unfavorable opinion formed by the reviewer,' was as follows: 'To refute all the errors which abound in 'Ecce Homo' would be tedious and useless.' This sentence was not in the original advertisement, and was only added by the publishers of 'Ecce Homo' after their first extract had been a subject of comment."

—The imminence of a great Continental war brings to the mind of the thoughtful the sufferings which the soldiers must endure, despite the advantage for relief offered by a thickly-settled country. *La Nazione*, of Florence, in a recent number printed an interesting and tolerably accurate account of the United States Sanitary Commission, in order to show what might be done for the sick and wounded in case of a war. The official history of the Sanitary Commission is being compiled by various hands. The first volume, comprising the general history of the Commission, by Mr. C. J. Stillé, of Philadelphia, is nearly through the press. The second and third volumes, containing accounts of special departments, will be ready for publication in about four and six weeks. The official account of the great Metropolitan Fair will probably be issued early in the fall. This volume, which should have been published two years ago, was delayed from various reasons, principally because no one connected with the fair had leisure enough to write it. It will make a handsome small quarto volume of about 250 pages, illustrated with photographs.

—The Crimea has long been known as the seat of those Jews who, on account of their opposition to the rabbinical traditions, have called themselves the Karaïtes or Biblical Jews. The first authentic account of them was given to the Christian world by the Dutch theologian, Jacob Trigland, who died in 1705. In 1839, at the suggestion of Prince Voronzof, Governor-General of Odessa, and president of the Archæological Society, one of the learned Jews of the Crimea, Abraham Firkovitch, assisted by his foster-son, Gabriel, travelled through all the Jewish communities as far as the Caucasus, and collected much valuable material for the history of the Jewish population. In this collection were Bible manuscripts as old as the fifth century, with important prefaces, numerous copies of such prefaces, a parchment roll with three attestations, which was found concealed in the south wall of the synagogue of Mangelis, at Derbend, in the Caucasus, and seven hundred copies of burial inscriptions, one hundred of them being paper impressions. To these, in 1863, the unwearied old Firkovitch added eighteen original inscriptions, which he had sawn from grave-stones at Tchufutkale. Tchufutkale means Jew-city, and in the Middle Ages was notably inhabited by Jews only. In 1261 it made a brave defence against the Genoese. Near it is a churchyard in a little valley called the Vale of Jehoshaphat, where the grave-stones were found. The inscriptions here show that the Crimea was peopled with Jews as far back as the Christian era; the thirty oldest grave-stones go from 555 A.D. back to 6 A.D. One of these inscriptions, now in the Asiatic Museum at St. Petersburg, is dated in the year 30 A.D., and reads, "Rabbi Moses Levi, dead in the year 726 of our exile." Another says: "This is the memorial of Buki, son of Isaac, the priest; may he rest in Paradise! To the time of the deliverance of Israel in the year 702 of our exile." The year 702 is three after Christ. Dr. Chwolson, in his paper on these inscriptions, published in 1865, considers that by the exile is meant the Assyrian exile—the exile of the ten tribes. A writer in a recent number of the "London Review" remarks that this is the only instance of the captivity being called by the name exile. He recalls the fact of there being two races of Jews—one fair, with a straight nose, often with reddish hair and blue eyes, of which the traditional face of the Saviour is a type; the other or Western Jews, dark, with large noses, like the Syrians, and remarkably like the sculptured Assyrians in the Ninevite slabs. From this he draws the conclusion that the Western Jews are descendants not of the ten tribes, but of the Babylonians who were taken to Judea to replace them. This, he thinks, is confirmed by inscriptions on some terra-cotta bowls found by Layard in his explorations on the Euphrates, which were Hebrew and Chaldæan, but in letters of a very ancient type, and which Mr. Ellis considered "invented to write the cuneiform character in a more cursive and expeditious way." One trouble of this theory is that it requires the Babylonian Jews to have been converted, to have forgotten their origin, and to have supposed themselves original Jews. Perhaps their pertinacious adherence to their acquired religion could be explained by the traditionary fervor of new converts.

—Among the new books announced as just published or in press, by W. I. Pooley, are "A History of the Episcopal Church," by Bishop Hopkins, and the English translation of Renan's "Apostles." Mr. Carleton also announces a translation of Renan, a "Life of James Stephens," and "The Mute Singer," by Mrs. Anna Cora Ritchie (Mowatt). Hurd & Houghton offer "A Memorial of the Rev. John Keble, with introduction by Bishop Potter;" "Principles of the Law of Contracts," by Judge Metcalf; and Howells' "Venetian Life." Appleton's list contains "Recollections in the United States Army," by Dr. Latimer; "Constitutional History of the United States, mainly from the Speeches of Stephen A. Douglas;" "Taxation," by Sir Morton Peto; and a new illustrated edition of Dana's "Household Book of Poetry."

—M. Octave Delepierre, one of the secretaries of the French Legation at London, and an active and learned member of the Philobiblon Society, has just printed twenty-five copies of a curious and interesting essay, written for that society, in which he gives an account of all those visions of hell and heaven which have been seen at various times by religious enthusiasts. "Le Livre des Visions en l'Enfer et le Ciel décrits par ceux qui les ont vus" is the title of the narrative. These are not mere descriptions of heaven and hell, of which thousands were written during the Middle Ages, some of them with a pretence of scientific knowledge, but visions which the visionary believed himself, in good faith, to have seen not in dreams or in imagination, but by direct sight. They occurred generally while the patient was in a state of catalepsy and seeming death, and when the soul was supposed to be absent from the body. One singular thing about these visions is the absence of all elevation of thought, the punishments described being exaggerations of the ordinary physical tortures met with on earth. Fire, cold, pitch, brimstone, and molten metal play a prominent part among the tortures, as also do beasts and serpents. Only one—that of some Godfrey, in 1321—repudiates the common physical conception of hell. The visions of heaven are few in comparison with those of hell, partly, perhaps, because the pleasures of the blest were imagined with more difficulty than the eter-

nal pains of the wicked. Light is almost the only characteristic of heaven; everything else is vague. One book escaped M. Delepierre's grasp, the "Recent Revelations on Purgatory," published by the Dominicans of Toulouse in 1865, the circulation being strictly confined to the penitents or refractories of that order. It is a pity that the world cannot see on what spiritual food the devotees of modern Catholicism may feed.

SCIENTIFIC.

Sense of Touch, Pain, and Temperature.—The perception of temperature and pain appears to be different in character from that of the ordinary impressions made upon the organs of touch. Pain is not merely an exaggeration of touch. Our perceptions become imperfect just in proportion as the impressions are painful in their character. The mere touch of the blade of a knife may be distinctly and correctly perceived, but when the skin is cut there is no longer a perception of the knife, but a sensation of pain only. Intensely hot and intensely cold substances are not perceived to be different, but both are similarly painful. M. Beau has given numerous facts to prove that sensibility to pain may be utterly abolished while common sensibility still remains. The surgeon, in operating upon partially etherized persons, has not unfrequently noticed this; the patient remaining perfectly conscious, seeing and feeling the knife or other instruments, but not suffering from the application of them. Weber found by experiment that the sense of temperature is more acute in the left hand than in the right, while the sense of touch is undoubtedly most acute in the latter. If the two hands, previously of the same temperature, be plunged into separate basins of water, that in which the left hand is plunged will be felt as the warmer, even though its temperature is somewhat lower than that of the other. Dr. Spring, in the "Medico-Chirurgical Review" for April, has recorded the history of an interesting case which gives support to the above views. A woman, aged sixty, after exposure to cold partially lost the sensibility of the right half of the body, including the head, though there was no loss of motion. On the paralyzed side she became insensible to pain and to the effects of a change of temperature, while ordinary tactile impressions were perceived as usual. She could feel the slightest touch on the affected side, and when the eyes were closed could, through the aid of touch, pick up a pin from the floor. Impressions of weight and contact could be accurately perceived; the hand resting on the table, if a given weight were placed on the palm, the removal of a small portion of it was at once noticed, with no other indication than that coming through the sense of touch. Yet, while washing her hands, though she distinctly felt the water flowing over the paralyzed one, she could not tell, from the impression made upon it, whether the water was hot or cold. Neither the pricking of pins nor pinching was perceived in the slightest degree, and when standing before the fire she was incapable of feeling warmth on the right half of her body.

Paralysis of the Right Side and the Loss of Speech.—One of the most remarkable results recently brought to the notice of physiologists is the observation of Broca, that when paralysis exists and is attended with the loss of speech or of articulate language, one or both, the paralysis is, in nearly every case, on the right side of the body, and is, consequently, dependent upon disease or injury of the left side of the brain; for it is universally admitted that disease or injuries of one side of the brain, if they produce paralysis at all, do so on the side of the body opposite to that of the disease or injury. In order to prevent misapprehension as to the sense in which the terms "articulate language" and "speech" are used, it may be stated that articulation is the mere utterance of words, and that speech is the expression of thoughts or ideas which may be expressed by means of articulate words, or by signs of any kind. It must also be borne in mind that loss of articulation does not necessarily depend upon disease of the brain, but may be the result of merely local causes, such as a faulty action of the muscles of the larynx or of the throat, tongue, or lips. A man may be unable to communicate his thoughts by means of vocal sounds, but he will nevertheless do so by writing or gestures. Broca has shown, and in each case verified his observations by post-mortem examinations, that the loss of articulate language may be the result of disease of the brain, and that, when it is so and no other difficulty exists, the injury or disease is always on the left side of the brain. Of twenty cases, carefully studied, all confirmed this view. Dr. Hughlings Jackson, in the reports of the London Hospital, has made a careful record of thirty-four cases of loss of speech, in thirty-one of which there was paralysis of the right side. In the other three the paralysis was on the left side, and consequently exceptional. Dr. Jackson's cases may, therefore, be said to confirm largely the views of Broca. The faculty of speech, as well as that of articulate sounds, may be lost to different degrees; but neither the sounds nor any other signs which a patient remains capable of making will serve to communicate thoughts or ideas correctly. Words may be uttered, but they will be applied in the wrong way and names to the wrong things, as when one woman called a dinner a "chair," and another called a chair a "potato." One person was offered a rose and asked if she could smell as well as usual, when she answered, "I can't say it so much," instead of "I can't smell so well." A woman who had loss of speech was asked to write her name, which she attempted to do with the following result: "Sunnil Sicla Satreni." Dr. Jackson, from motives of delicacy, withholds her real name, but says it bore no resemblance whatever to the name written. When asked to write her address, she did it as follows: "Sunnesr Nut Ts Merr Tinn—lain;" yet this woman was intelligent and knew persons and things, as did others who could not express themselves intelligibly, or, if sometimes intelligibly, still very incorrectly.

Prussian Salt.—The history of mining enterprise is filled with examples of the great influence which a single undertaking will sometimes exert upon the business of a country. A salt mine which was opened a few years since near Magdeburg, by the Prussian Government, is a case in point, and is one of peculiar interest because of its extreme simplicity. Some twelve or fifteen years ago Prussia consumed, for culinary purposes alone, 257,000,000 pounds of salt per annum, the proportion being about fifteen pounds for each and every inhabitant of the kingdom; a proportion, by the way, which, in keeping with the lethargic spirit of the country, had remained fixed and unvarying during a quarter of a century. The amount above mentioned was employed solely for household purposes, for the very considerable quantities used in agriculture and by various manufacturing establishments were not taken into account. The amount of salt produced by Prussia at the same time, at the various saline springs of the country, was only 214,000,000 pounds, or, roughly estimated, scarcely seventy-five per cent. of the quantity consumed within the kingdom. More than 50,000,000 pounds of salt had, therefore, to be imported into Prussia every year. It was in the hope of doing away with this condition of things that the Government proceeded to excavate the mine in question. To what extent this hope has been realized may be inferred from the following facts: The salt was reached about ten years since and has been actively worked ever since. It may, therefore, be safely assumed that the new order of things has by this time arrived at a condition of tolerably stable equilibrium. There is, at the same time, no evidence that the other works at the old salt springs have been given up. According to official statements there was sold from the single mine here in question, in the year 1862, 101,000,000 pounds of salt; in 1863, 152,000,000 pounds; and in 1864, 201,000,000 pounds. In 1865 the quantity sold appears to have been less, though no official statement of it has as yet come to hand. Some observers estimate the amount as low as 166,000,000 pounds. However this may be, it will be seen at once that so far from importing salt, Prussia is now in a position to export this commodity. Large quantities of it are in fact now exported, chiefly to the smaller German States, to Holland, and to Holstein. At one time it was even anticipated that the Prussian salt would be able to gain a foothold in the English market, but the hope has not yet been realized. The cost of mining the salt is very small, and it is cheaply transported to the ocean, by water, by way of the river Elbe.

SPENCER'S BIOLOGY.*

"The aim of this work is to set forth the general truths of biology as illustrative of, and as interpreted by, the laws of evolution; the special truths being introduced only so far as is needful for elucidation of the general truths." This first volume consists of three parts: the first, called the "Data of Biology," treats of the elements, the materials, and their properties which enter into the processes of life, and the ideas which determine its definition. The second, called the "Inductions of Biology," treats of the various fundamental facts and classes of facts observed in organic life in general, including the main principles of biology as an inductive science. The third part, called the "Evolution of Life," is a discussion of the bearing of the general facts of biology on the question of the origin of species. In his second volume Mr. Spencer will "pass to the more special phenomena of development as displayed in the structures and functions of individual organisms." Two other works, the "Principles of Psychology" and the "Principles of Sociology," will complete the labor which Mr. Spencer has proposed for himself, namely, the survey of the sciences for the purpose of including all human knowledge under the conceptions set forth in his "First Principles," and for establishing a universal science or philosophical

* "The Principles of Biology. By Herbert Spencer. Vol. I." New York: D. Appleton & Co. 1866.

system on the basis of the inductive sciences, interpreted by certain forms or laws of thought which Mr. Spencer assumes to have an *à priori* validity and a universal application. These forms are given in the mechanical conceptions of matter, motion, and force, and the *à priori* truths supposed to be implicated in them. Every fact of science is to be represented in such mechanic terms.

As a philosophical theory this system has also, of course, a theological as well as a scientific side. It proposes a cosmological theory of the dependence of the world of phenomena on its unknown cause. The unknowable, hitherto represented as the Creator producing the world from a non-phenomenal existence, or from nothing; or pictured as the Great Artificer building an order out of chaos, is by Mr. Spencer represented as the cause, the unknown cause, of evolution, continuously producing the worlds and all the forms of life. Evolution is regarded as the profoundest conception which the human mind can compass of the divine agency in creation. The first existence, or the chaos whence the world and its order arise, is the homogeneous or undifferentiated matter of the universe, with its primitive forces and their necessary laws. Creation, or the connection between the first cause of things and the last effects of nature, consists of the processes by which the world passes from the homogeneous to the heterogeneous. This is the direction in which creative power is exerted. It is the unfolding of the properties of matter and force. These terms, matter and force, must be understood, however, in a sense broad enough to include all first existences which are cognizable, and to exclude the antithesis between the metaphysical and incomprehensible entities "matter" and "mind." The phenomena of mind are also to be formulated in terms of matter, motion, and force; but it is matter in a generalized mechanical sense that Mr. Spencer takes as his type of the first cognizable existence.

If we must have a cosmology—if we cannot restrain our speculative faculties to a less ambitious exercise—then that theory of the universe in its totality which agrees best with the facts of science and the ideas with which science has familiarized instructed minds in modern times, is the one most likely to gain credence. But science itself stands in no need of such illumination. The leading idea of Mr. Spencer's system, the thread on which he displays a mine of scientific lore, with unsurpassed abilities in scientific speculation, is too weak to sustain its load. Not that his facts in any degree militate against his thesis: they only fail to prove what is peculiar to it. They simply "illustrate" what Mr. Spencer means by his law.

Different portions of Mr. Spencer's writings have very unequal merit. It is his ambition to produce a philosophy; but his strength lies in his clear summary expositions of the widely various departments of scientific facts and generalizations, with which he has most industriously and laboriously made himself acquainted, and in the ingenuity he displays in the very suggestive and instructive generalizations and colligations of the facts which he presents. In such portions of his writings he is clear and strong, though somewhat too easily impressed by a mere analogy, and sometimes mistaking a figure of speech for a matter of fact. But when called upon to rise into the region of pure abstractions in setting forth his system, and dealing with the ideas to the illustration of which he has devoted so much study, his writing becomes vague and weak. He is obviously not so able in the treatment of the higher abstractions as in the proximate generalizations of science. Where the philosopher would appear at his best, Mr. Spencer becomes very tedious. His grasp of the mechanical ideas by which he would interpret the facts of biology is quite unlike what the masters of mechanical philosophy have shown in the mechanical sciences. His application of mechanical ideas to the organic sciences very much resembles the use made of similar ideas in physics before the time of Galileo. His principle of the "Persistence of Force," which in his book of "First Principles" he supposes to be the same as the mechanical doctrine of the conservation of force—only a better name for it—has none of the technical precision and definiteness which belong to this doctrine; and the important conclusions, which he deduces somewhat summarily from it, really flow, so far as they are facts, from the more general philosophical doctrine, "the Law of Causation." Mr. Spencer's "Persistence of Force" is in fact only a mechanical name for this fundamental postulate of science. In the same way, to suit his system, he renames other principles of science. Mr. Darwin's law of "Natural Selection" he designedly translates "Indirect Equilibration," while the principle of the improvements of adaptation by use he calls "Direct Equilibration."

If this mechanical terminology really added anything to the resources of science; if Mr. Spencer could deduce anything from his mechanical principles which could confirm any inductive conclusion or direct any inductive enquiry, which are not already confirmed or determined by philosophical principles without a mechanical dress, we should welcome his philosophy most cordially. As it is, this mechanical dress seems to us superfluous.

But to return to Mr. Spencer's lucid expositions of science. No account of the argument for the transmutation hypothesis has appeared to us abler or clearer than part third of this volume. Not even Mr. Darwin's remarkable book presents the evidence so conclusively. But Mr. Spencer appears to value this part of his book and, indeed, all his disquisitions on the "special truths" of science only in so far as they "illustrate the general truths" of his philosophy. He evidently prides himself on his weakness, and is quite unconscious of his real strength. All that his studies prove, or tend to prove, is "that the groups within groups" of related races, "which constitute the animal and vegetal kingdoms, have arisen by direct descent, multiplication, and divergence—that is," he adds, "by evolution." But evolution implies more in Mr. Spencer's philosophy than the transmutation hypothesis postulates. It implies and necessitates progress, a progress which is inherent in the order of things, and is more than the continuity and community of causation which the physical sciences postulate. It borrows an idea from the moral sciences, the idea of an end. Mr. Spencer's philosophy is not teleological in the narrower sense of the word; that is, it does not postulate specific ends—like the conditions of human happiness—as determining the order in nature; but it is none the less as a cosmological theory—or a theory of the universe in its totality—charged with a mission. It contemplates the universe in its totality as having an intelligible order, a relation of beginning and end—a development. All that the transmutation hypothesis presupposes is continuity and uniformity in the temporal order of nature. Mr. Spencer admits that paleontology, the only inductive science which can testify directly on the subject, is inconclusive. So far as inductive evidence is concerned, it is doubtful whether there has been any progress in the types of organic life. That the present forms of life are derived from comparatively few forms living in the remote past, is probable from the argument from classification; but that these forms were the only types of life then in existence, or that the extinction of species has not kept pace with their multiplication, cannot be concluded from the geological record. Transmutation, then, is as well fitted as any word to express all that the evidence of paleontology, the geographical distribution, or the classification of animals and plants tends to prove. The argument for progressive development from embryology is merely analogical. To be valid it requires a much closer resemblance in essential points between the terms of comparison, namely, between the individual life with its limits and definite steps of progress, and the indeterminate continuity of life in a race. Evolution expresses more than the evidence warrants, and more than many transmutationists are disposed to admit. "It may be thought paradoxical," says Lyell, "that writers who are most in favor of transmutation (Mr. C. Darwin and Dr. J. Hooker, for example) are nevertheless among those who are most cautious, and one would say timid, in their mode of espousing the doctrine of progression; while, on the other hand, the most zealous advocates of progression are oftener than not very vehement opponents of transmutation." . . "The true explanation of the seeming anomaly is this, that no one can believe in transmutation who is not profoundly convinced that all we know in paleontology is as nothing compared to what we have yet to learn, and they who regard the record as too fragmentary, and our acquaintance with the fragments which are extant as so rudimentary, are apt to be astounded at the confidence placed by the progressionists in data which must be defective in the extreme."

Mr. Spencer is both a transmutationist and a progressionist, but he is the latter on *à priori* grounds chiefly. No one has set forth and illustrated the imperfections of the geological record more forcibly; but, instead of following the cautious naturalists, and suspending his judgment in the lack of evidence, he takes advantage, as it were, of this lack to reach his conclusion by the "high priori road."

A philosophy like Mr. Spencer's is doubtless a great *desideratum* to many, nay, to most minds, to enable them to receive the facts and hypotheses of modern science hospitably. A philosophy once received is a potent source of credence, and makes it easy to admit asserted facts and to entertain hypotheses. That the general belief in supernatural agencies has proved the miracles, and filled the world with fairies, devils, and witches, cannot be doubted. That a general doctrine which excludes all supernatural agency will enable the inductions and hypotheses of science to take a firmer hold on the faith of mankind, is equally certain; but this is not the method in which the facts and theories of science have been established. An intellectual virtue very rare and difficult to attain, the power to go out from all philosophies and preconceptions into the world of observation and fact—the power to suspend the judgment and to scrutinize facts on their own merits—this is the virtue of the scientific philosopher, and the potent cause of the great change in the intellectual life of modern times.

GOLDWIN SMITH ON AMERICA.*

We do the American public a service in calling attention to a little book from which it cannot help getting both pleasure and profit. It is an address by Professor Goldwin Smith, delivered before the Union and Emancipation Society of Manchester, and now printed under the title of "The Civil War in America." But it is something more than this title would seem to indicate; it really is a brief account of the people of the free States, of the spirit of their political system, of their social theories and practice, by a philosophic student of history, his defence of all these against the attacks commonly made on them by the friends of absolutism and aristocracy, and his exposition of their virtues and defects.

The literary merits of the work are such as by themselves make it worthy the perusal of most readers and the study of most writers. Perhaps there is hardly one among living English authors whose writing, while it is so free from the display of art, is more obviously the product of the highest art, or rather, to speak more exactly and to avoid a word whose meaning is not unmistakably good, the product, we will say, of the highest discipline and culture. Precisely this praise cannot often be given even to fascinating writers. Dr. Newman, for example, delightful as he is, sometimes allows the graceful ease and frankness of his discourse to approach very nearly or to overpass the verge of carelessness; and this is either want of art or it is something very like artifice. And is not the accomplished Matthew Arnold obnoxious to the severer of these two accusations? Not seldom he surprises the reader with what seem very doubtful phrases, such, for instance, as "split the difference," "much on a par," "the best style going," etc., obeying, perhaps, a precept of Joubert's, and with the too obvious design of tempering the natural daintiness of his style and giving it simple directness. And, generally, nowadays, when the periods of our fathers are going into contempt and oblivion, and the loose sentence is laboriously constructed, and slang finds defenders in prefaces, the tendency in composition is either to forms with too little of art or a little of artifice, carelessness or an affectation of it. This by the way, however. We praise Professor Smith's style for its positive qualities. For a full enjoyment of its excellences a special examination may be requisite, there is such fulness of matter and the medium through which the matter is seen is so transparent. Some of its excellences, again, are of the striking kind and not to be missed, as in the phrase "a neutrality of Alabamas"—an epigrammatic condensation of several hundreds, perhaps, of recent Anti-English editorials and speeches; or in this sentence, with its allusion to communism, its rebuke of nominal Christianity, and the distinction it draws between these and influences truly Christian, "which, whenever they decisively prevail, without taking away the landmarks of property, transmute proprietorship into duty." And for its easy force, its simplicity, and plain elegance, and never-failing dignity, his style is secure of the admiration and deserves the attention due a master's work.

Of Professor Smith's ability to speak upon the subject which he chose, and to say something valuable to us as well as to his countrymen, there can be no doubt. We were living, to be sure, in the thick of the conflict which he describes, while he looked on; but his eye was educated to the task, and he was able to study calmly the nature and the working of that spirit of our age and country which, though it has made us the very men we are, moulded us without our knowledge.

That spirit, he says, is not free democracy. Democracy is a political arrangement merely. What all America will one day be, what the North has always been, what she was during the war and is now, that she was and is and will be by virtue of the spirit of free Christianity. Not Christianity paralyzed by political alliances, represented by "a state clergy who are legally bound over against conviction," but living, expansive, growing; not Christianity imprisoned in narrow sectarian creeds, but full of faith in God and faith in man also, full of the spirit of progress and of hope in the future of humanity. The operation of this power, at least in our New World, happily untrammelled, he traces in all our social and political life. In this he finds the secret of the American eagerness for vital truths in religion and contempt of ecclesiastical questions; this makes us demand popular education; it is the reason of our clemency to rebels; it makes our criminal codes so mild; to this must be attributed the honor paid to labor, the absence of class divisions, the general respect for law, the courtesy to women, the kindness to servants, all the truly distinctive features of American life. Our democratic institutions are but the application of this spirit to the concerns of government. This argument he enforces by illustrations drawn from what he himself saw in the North, and by the contrast of all which a spirit essentially different notoriously produced in the ignorant, barbarous, and oligarchical South.

The darker shades, also, in the bright picture which he saw are faithfully reproduced. But it is not our purpose to do more than commend the essay to the attention of the reader, especially of the reader who seeks to understand the meaning of his time and is glad of light from whatever source. Slight as the work is, it seems to us to merit the name of history—history written on the best of the three methods. Not a book of annals to supply the bones of the pictorial, dramatic history, it is able to supply the soul of such a work in many volumes, and the student must find it all the better for wanting the body.

Nor is it only of American life and history that this English praise of America speaks; of England, also, we learn something, or, rather, are confirmed in what we knew and felt before. It was impossible to read this eloquent statement of the ideas loved by Americans, and this earnest and confident defence of them as the ideas right in the present and sure of the future, without seeing, and rejoicing to see, that the true Englishman and the true American may interchange citizenship, yet neither forsake the only real allegiance he can owe—fealty to the cause of liberty and human progress. Elsewhere, the camps are not broken; but they and we are already engaged, and what both fight for is the same.

* "The Civil War in America. An Address read at the last meeting of the Manchester Union and Emancipation Society. By Goldwin Smith." London: Simpkin, Marshall & Co. 1866. Pp. 96.

Lange's Commentary on Mark and Luke. Edited by Dr. W. G. T. Shedd, Dr. P. Schaff, and C. C. Starbuck: (Chas. Scribner & Co., New York.)—Dr. Lange's Commentary, when it is completed, will no doubt be superior to any other now in general use. No pains have been spared to make it thoroughly exhaustive of the matter which it has in hand. Such of its conclusions as are not purely individual are no doubt pretty much the same as if the work had been prepared a century ago. But the fact that these conclusions are no longer universally accepted is not concealed, and sometimes the objections to them are so fairly stated that the objection rather than the argument against it will commend itself to the intelligent reader. The second volume of this commentary has now been translated and enriched with many editorial notes. These notes, Mr. Starbuck's especially, are very valuable, and almost never fail to light up the darkness of Dr. Osterlee's interpretations, which are sometimes so far-fetched as to appear almost ridiculous. The volume on Matthew, published a year ago, has been very favorably received, and there is no apparent reason why the present volume should not be received in the same manner. As the result of a collective effort a certain amount of dulness is to be expected. A work of this sort coming from an individual mind would have much more enthusiasm. But what the Commentary lacks in this respect it gains, no doubt, as the consensus of a great number of intelligent and learned men. The structure of the volume would be a matter for great praise but for the suspicion that the structure of the gospels, on which it professes to be based, does not justify anything so methodical. This suspicion attaches to the treatment of the second gospel much more than to that of the third. The life of Jesus as there represented consists of a series of contests and victories alternating with periods of rest. A great deal of ingenuity is necessary to make this appear, but the resources of the commentator are immense. Many will be carried away by his idea, but not a few will think that it is better not to overload the gospels with so much machinery. The treatment of Luke is less liable to this objection. There is an introduction to each gospel, in which questions of age, authorship, etc., are discussed with considerable fairness. The critical and exegetical portions of the work will be of use to every class of minds, although somewhat overshadowed by the dogmatic purpose of the book. The "doctrinal and practical" portions are more doctrinal and less practical than we could wish. The homiletical remarks contain a great amount of beautiful suggestion. But, despite of all the merits of this work, we would not advise any person to read the New Testament only from its pages, for there are many things in the New Testament which do not need to be explained, and which only lose by explanation. Appeals to the heart ought not to be converted into the language of the head. But Dr. Lange's Commentary should be measured by the standard of success which he has chosen. It is professedly an attempt to find in the New Testament the golden mean between Romanism on the one hand and Liberalism on the other, and it is difficult to see how such a purpose could have been more resolutely carried out.

A Text-Book on Physiology, for the use of Schools and Colleges. By John William Draper, M.D., LL.D. (New York: Harper & Bros.)—This book, as the author tells us, is mainly a condensation of his larger work, well known to the medical profession. The manuals of physiology for popular instruction hitherto published are chargeable with frequent errors and signal deficiencies. From these the present one is comparatively free. For, although the author reiterates many of his favorite speculations, he is not guilty of ignoring important topics and of treating others with a careless superficiality, as has been so commonly done. This thorough treatment is a merited tribute to the increasing interest in science manifest in the non-professional community. As just intimated, we find the writer's peculiar views concisely, yet clearly, stated; and this will give the book a value even to the medical student, who may not have access to the more extensive treatise. But its value is seriously impaired by the too intimate blending of speculative views with truths well established and acknowledged by physiologists at large. This objection has the greater weight as the class for whom the manual is intended have not, for the most part, the means of estimating aright the author's theories as compared with those of other distinguished workers in the same field. The need, therefore, is still unmet for a popular hand-book in this department, that shall state what is known in language which,

without becoming puerile, may be less technical, yet no less accurate. Notwithstanding these defects, the present appears to us the most available manual for its purpose that we have yet seen, provided it fall into the hands of a competent teacher. The cuts and the printing are good, and the size of the volume renders it convenient for study and reference.

Ænone: a Tale of Slave Life in Rome. (New York: John Bradburn.)—The reader who opens this book with the expectation of finding in it illustrations of slave life, as a distinctive social feature of ancient Rome, will probably be disappointed. In spite of its array of sonorous Latin names, and a liberal use of the classical "properties" which such books as Becker's "Gallus" supply, the story might be adapted to any other condition of society than that selected, or to any other place or time; as well to New York in the nineteenth century as to Rome under the Empire. It is spun out to a tedious length, and the characters deliver long speeches at each other with such painful iteration as almost to impress one with the conviction that they are talking against time. The descriptive portions are not less diffuse. We should judge the book to be the production of a young author (a woman, evidently) having a superficial knowledge of classical literature, a decided fondness for fine writing, and a considerable facility in depicting character. The last qualification is that which alone redeems "Ænone" from utter dulness. The characters are really well drawn and contrasted, and, had the story been curtailed to one-third of its present length, would have made an impression upon the mind as decided as it is now vague and uncertain. But they are not Roman, nor even antique, because the author has had no true conception, so far as the present production indicates, of the essential conditions or characteristics of antique life. If "Ænone" is a first attempt, as seems not improbable, the author is capable of better things, provided she chooses a less ambitious walk in fictitious literature. The number of genuine *classical* novels is still small.

THE WARLIKE PREPARATIONS IN ITALY.

FLORENCE, May 19, 1866.

LAST evening the telegram ran thus: "The Austrian Government has received confidential information touching the programme of the congress, and has answered that, with regard to the duchies, it could not admit universal suffrage, but only a vote of the states. Touching federal reforms, the basis of the Prussian project must be excluded. Touching Venice, it demands what are the territorial compensations that will be offered." This morning it reads thus: "The Austrian Government demands a territorial compensation in Germany for its renunciation of its rights over the Duchies of Elbe, and refuses, meanwhile, to discuss the proposition of the cession of the Venetian provinces." These two telegraphic despatches arriving within twelve hours, may give you an idea of the state of suspense in which the public mind is kept. One day the war seems certain and imminent, the next there seems every possibility of a pacific arrangement based on the cession of Venice with the four fortresses razed to the ground in exchange for Silesia. Both governments, however, have borne in mind the old Tuscan proverb, "If you desire peace, prepare for war," and at the present moment both may be said to be prepared. Austria has concentrated 200,000 men in Venice and the Tyrol, *i. e.*, 10,000 at Mantua, Borgo-forte, and Ostiglia; 30,000 at Verona; 20,000 at Padua; 40,000 at Rovigo; 6,000 at Legnago; 15,000 at Venice and Chioggia; 6,000 at Peschiera; 20,000 at and around Friuli; 30,000 in the Tyrol, and 50,000 at Trieste and Gorizia. The utmost care is taken to strengthen Pola, which is the only military port of the empire. Here, in 1848 and 1859, the Austrian fleet found a safe refuge from the attacks of the Sardinian, Italian, and French navy. Since then it has been reinforced by formidable fortifications; around the city three fortified lines are erected; the first is composed of a series of iron-clad batteries whose fire crosses the passage leading to the Gulf of Pola; the second consists of a series of fortifications built on the rocks at the mouth of the bay. In order to enter the bay, the enemy's ships must have passed through the fire from the batteries of Brioni and Veruda and the fire of the fortifications on the rocks; the third line is composed of detached forts built round the bay, which defend the front entrance to the bay and all the military edifices erected along the shore. All the towns along the coast which offer safe anchorage, such as Capodistra and Pirano, Cittanuova and Rovigno, are also fortified. Aware of the immense importance of the railroad of Nabresina (in Trieste) as of those in Istria, and aware that the hostile populations will attempt everywhere to destroy them, detachments of troops are placed all along the lines. The Government is also hastening to profit by the stipulations of the treaty of Paris as to the method to be adopted towards merchant vessels and other private ships at sea, respecting both when the enemy agrees to do the same. The Italian Government is by no means inferior in energy, and its efforts are facilitated by the unparalleled enthusiasm of the army, the national guard, the volunteers, and the populations.

At the present moment 220,000 troops are ready to be placed in battle array, being either massed along the frontiers or at easy distances. It was at first decided that 50,000 soldiers should be distributed throughout the middle and southern provinces, to protect the army from clerical and reactionary enemies in the rear; but the national guard pleaded so earnestly that the defense of the interior should be entirely confided to them, that the Government had almost resolved on trying the experiment, when the menacing attitude resumed by brigandage in various portions of the Neapolitan provinces rendered the detention of a considerable body of troops necessary. At Melfi, a town of 9,500 inhabitants, Crocco, at the head of 100 men, has just murdered the syndic and sub-prefect, and the 4th battalion of bersaglieri, already embarked for upper Italy, were landed at Naples and sent against the murderers. Teano is also menaced by a large band of brigands, and against these the 39th battalion of bersaglieri are despatched. They will make short work of them, I fancy, especially as the new law on public security enables the local authorities to arrest all the aiders and abettors of these fiends, as the soldiers are furious at being baulked of their chances of a campaign against Austria, and the officers talked of sending in their resignation *en masse*. But let us admit that it will be necessary to retain 50,000 national troops in order to keep our internal foes, whose headquarters are at Rome, in check; that the 50,000 conscripts of the April levy are only partially mustered and drilled; that the second categories of 1842–43 are only just summoned and have never been drilled; that another 60,000 must be deducted for the service of depots, military establishments, hospitals, commissariat, staff, etc., Italy can yet bring 300,000 men into the field—three hundred thousand well-trained, well-disciplined Italians—all anxious to distinguish themselves against Austria. "Our army will perform miracles," wrote General Bixio this morning from Piacenza to a friend, and his testimony, as an ex-Garibaldian, is worth something. The artillery may be estimated at 400 guns. There seems to be a great deficiency of horses; 20,000 were demanded, as yet but 10,000 are purchased; the prices have risen in proportion. The preliminary work of the commission of volunteers is almost completed. Colonel Corte starts to-day for the depots of Northern Italy and Sicily, established at Carno and Varne; Colonel Nicotera starts for the depots of Southern Italy, established at Bari and Barletta. Already more than the 20,000 needed for the twenty battalions are inscribed in the divers cities of the realm. Milan alone sends 3,695. General Garibaldi is on the whole satisfied with the arrangements. He intends to remain at Caprera until the battalions are called out, and is by no means certain yet that there will be actually war. He declines the formation of the ten regiments into two brigades and wishes only to have colonels under him, unless the number of battalions be augmented. He wishes Colonel Corte to be the head of his staff, Colonel Acerbi head of the commissariat staff, and Dr. Bertani head of the ambulance. The two former decline the honor and prefer the command of a regiment, or even of a battalion. Besides the twenty battalions there are to be two corps of Genoese and Lombard sharpshooters, commanded by the chief of '59 and '60, Antonio Masto, and a corps of guides on horseback, commanded by Missari, who has just told me that the Government has refused him a single horse, averring that they cannot muster enough for themselves. This will make the corps very aristocratic and exclusive, as none can enter who are not sufficiently wealthy to purchase their own steeds.

Mazzini has issued a manifesto, entitled "The War." Differing from certain members of his party who, through his organ the *Unità Italiana*, published in Milan, have maintained that the Italian democracy ought to take part in no war that is not initiated by the people, the Apostle of Italian Unity insists that the entire country ought to rise and render the war, with allies or without allies, inevitable. "The war for the emancipation of Venice was, up to the present moment, a duty; now it is a necessity. To-day all Italy is Venice; the life, the future, the honor of the nation await their ransom between the Alps and the lagunes. The war ought to be exclusively Italian."

The *Nazione* of Florence publishes a long article on "What the American women did for their wounded," and committees are being formed all over the country in imitation of your "Soldiers' Aid Societies." If your kind countrywomen would help us a little with their experience and surplus stock we should be grateful indeed. When I remember the careless way in which our wounded were thrown across mules or jolted in springless carriages in 1860, and read the accounts of your hospital cars and slung elastic beds, I feel that I would do a great deal to get one or even an exact model of one over here!

The decree for the formation of the volunteer battalions is just issued. This news has rendered the public incredulous of pacific negotiations. "Può darsi," they say, "*ma non è possibile!*" The Austrian legion destined for Mexico has been disbanded in obedience to the threatening note of your Government. A number of the soldiers are incorporated in the Austrian army, but the captain of the Tampico, in the port of Trieste, refuses to allow his passengers to land, as their passage is not paid! J. W.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

WHAT THE FENIAN WAR REALLY IS.

THERE is no question that a very large portion of the apathy with which the Fenian performances are regarded by the public is due to the not unnatural enjoyment which people take in the spectacle of the Canadians suffering from raids. The St. Albans affair and the state of alarm in which the inhabitants of the American border were kept for nearly two years, by the threats of bands of Confederate vagabonds congregated in the Canadian towns, have made a deep impression on the public mind, aggravated, of course, by the "judicial" proceedings at Montreal in which Judge Coursol figured. It would be difficult to find in modern history a case of more wanton and shameless connivance at a great crime on the part of a highly civilized and professedly Christian community. Coursol was, no doubt, a corrupt and ignorant man; but he would never have ventured to parade his ignorance and corruption as he did if he had not well known that his proceedings had the secret sympathy of his neighbors. The Canadians tried to flatter themselves that when General Dix's order was overruled by Mr. Lincoln and the Young affair blew over, that all was over. But the press here warned them the real mischief of the St. Albans affair, and of the impunity enjoyed by the rebel conspirators on Canadian soil, did not lie in the amount of material damage suffered by the United States, but in the fact that they laid the foundation for endless trouble in the future. The Canadians laughed at these warnings then; they now know what they mean. There may be powers in the world strong enough to treat all international obligations with contempt; but even Great Britain is not amongst the number, though she have Canada at her back. The retribution may not always come in the shape of open war, but it generally comes somehow. Roberts and Sweeney are rather contemptible instruments to serve as avengers of international perfidy; but in this instance they do the work pretty faithfully.

That this feeling of soreness on the part of the public here is pretty deep may be inferred from what we have been submitting to for the past month or two. We have witnessed, without the slightest formal indication of dissatisfaction, the creation of an avowedly foreign government in this city, with the various departments and bureaus necessary for carrying on military operations against a power with which we are at peace. We have seen it commission officers, issue bonds, and actually raise an army, open recruiting offices, and collect arms and ammunition, and assemble great bodies of men at rendezvous on our soil, for the purpose of commencing hostilities. We have had the commander-in-chief of this army travelling to and fro on our railroads, with large bodies of men marching on our territory under his command, and have actually seen our lines of telegraph cut by his orders, in order to prevent our own officers and police obtaining information of his movements. We have seen one district-attorney flinch from arresting him, fearing he could not summon force sufficient for his purpose, and have heard the same general-in-chief, when actually engaged in the breach of our laws, warn him that he would come to grief if he meddled with him. We have seen a hostile column leave our soil, invade that of our neighbors, fight on it, and then fall back into our territory again, and the foreign government which he professed to obey issuing a general order, in New York, promoting the man to a brigadiership for his gallantry.

These things are hard to bear. No civilized government ever bore them before from any power not vastly stronger than itself. Austria used to do this sort of thing in the small Italian states, and Napoleon used to do it in those European kingdoms over which he had set viceroys of his own. Of course, we should not have borne with it if the absurdity of the performance had not been so monstrous. Most Americans, who paid any attention to the Fenians during the last year, thought it was a "little game" with which Irishmen not troubled with much occupation were amusing themselves. We think it very unfortunate that this impression prevailed so widely, because it enabled the Robertses and the Sweeneys to persuade their dupes, who are mostly ignorant persons who have no means of getting at the real state of American feeling, that the apathy they witnessed on the part of the public and of the law officers indicated sympathy with their enterprise, and assured them of impunity in carrying it out. They were thus enabled to strip thousands of poor men and women of large sums of hard-earned money, to add to the existing disturbance of the industry of the country by drawing off large bodies of young men to the border, and finally—what we consider more serious than all else—to set before the hundreds of thousands of ignorant foreigners who reach our shore every year a most dangerous example of the way in which the law may be openly defied and contemned in their adopted country. If the Fenian performances of the last six months have not done much to weaken respect for law amongst that now immense class of our population who are still unaccustomed to the self-restraint in which Americans are bred, German and Irish human nature must have undergone some radical change. We greatly fear the Fenian organization is not the last attempt we shall witness in this country to supersede or set aside the national authority, by bodies of men having little or no interest in the national welfare and using the national flag and the American name as a temporary convenience.

It may have been on some accounts wise for the President to abstain from interference till the thing had come to a head. It may be that the suppression of the movement will meet with a support from the public now which it would not have met with had it taken place any sooner. But we do hold that, let the public support it or not, this interference ought to have taken place before blood was shed. We are a Christian people, and no matter what the Canadians have done or left undone, we owe it to our own souls not to let bands of ruffians leave our soil for the purpose of killing their young men and desolating their homes. There are some forms of retaliation to which we cannot descend without guilt, and connivance at or sufferance of Fenian raids is one of them. No matter what sympathy we may have with the wrongs of Ireland, no invasion of Canada by people like these Fenians can be anything but brigandage on a great scale. O'Neill's "battle" was murder—simple murder; Sweeney's battles, if he ever fights any, will be murder—murder committed by the offscourings of our population, led on by adventurers who are ready to fight under any flag for pay and "pickings." People ought to remember this. Calling Sweeney a "general" and Roberts a "President," and their followers "brigades" and "regiments," does not alter their real character. They are, by the law of nations and our law and God's law, still brigands. We say by God's law, because even supposing war to have the Divine sanction, nothing is lawful war which is not undertaken with a reasonable hope of success, or in defence against an attack. But the liberation of Ireland through the killing of Canadians and ravaging of their homes, is just as impracticable as through the invasion of Jamaica or British Guiana—a wild, senseless scheme, which no men of conscience, or honor, or intelligence would enter upon. No Irishman of character or position in either hemisphere has anything to do with the movement, and there is nobody who does not know that the fate of that unfortunate island under the rule of the Sweeneys and O'Mahonys would be ten-fold worse than it is ever likely to be again under that of Great Britain, even supposing the present fair promise of reform to be blighted.

BRIGANDAGE IN NEW YORK.

SOME of our readers may remember that during the last year a night attack was made by a party in disguise upon a house in Oneida County, New York, resulting in the murder of one of the inmates and the severe wounding of another. The house itself was set on fire, but was not destroyed. The telegram which announced this news made the extraordinary statement that the midnight assassins were believed to be highly respectable young men, and that the public generally rather approved of their action. Shortly afterwards, two or three young men were arrested on suspicion of being concerned in the matter, and did in fact appear to be the sons of substantial farmers. The coroner's jury brought in a verdict against them, couched, however, in mild terms, and fresh indications of popular sympathy appeared in their favor.

The county papers stated at the time that the house thus assailed was occupied by a family of noted robbers, who had for years managed to evade the law, and that this attack was made by persons injured by their depredations and rendered desperate by their inability to obtain satisfaction through legal measures.

Several months have elapsed since these events took place, and we had almost forgotten them, when the report of the Prison Association of this city, lately published, recalled them to mind, and gave an account of the motives for this unlawful resort to violence which opens a view of society in the interior of this State that can only be compared to the terrible disorganization of Southern Italy.

According to this statement, the truth of which we see no reason to doubt, the family who were attacked as above-mentioned are noted thieves, who have grown rich by carrying on their business with the aid of an organization spreading over eight or more counties in Central New York. In all these counties they have confederates who interchange plunder with them, and run off stolen property in such manner as to avoid detection. Often indicted, they have never been convicted, and never lie in prison for want of bail. "Respectable" farmers always come forward as their sureties, and are reasonably suspected of being partners in their gains. Magistrates and prosecuting officers are also believed to be in league with these plunderers, who are never reached by the law, but who find no difficulty in using the law as a means of revenge upon those who injure them. Thus, they have caused the detention of a man and his wife in jail upon a charge of larceny, universally disbelieved, for a period of eighteen months, in consequence of the woman having given information against the gang of thieves thus bound together. Many similar cases, it is said, might be mentioned.

Of course a band of robbers thus powerful and malignant do not hesitate to resort to measures of more positive violence than these. Whoever makes himself active in seeking justice against them, speedily finds his barn, or even his dwelling, burned in the night, his horses stolen, or his cattle stabbed in the fields.

A circumstance of this kind, last summer, brought matters to a climax. A constable of Madison County, who had made himself very offensive to rogues, was arrested by two of these thieves, under a warrant from a justice of the peace in their interest, and they were taking him to their own house, instead of to jail, when some citizens of the town of Hamilton compelled them to change their course and carry him directly to the lawful jail. In less than a month, the barns of five of these interfering citizens were burned, and two of their best horses stolen. This outrage determined the people upon taking the law into their own hands, and the result was the midnight assault to which we have referred.

This picture of law defied and, which is far worse, perverted to the service of villany, of plunder organized and triumphant, and of men externally respectable in league with gangs of robbers, is one which may well excite a feeling of shame in every citizen of the State. We fear that it is not in any way exaggerated. We have heard, from residents of Central and Northern New York, charges of complicity with crime against even higher officials than are implicated by this statement. Such rumors are too often founded upon some basis of fact, and though in the particular cases which become public there is frequently more in the rumor than the facts would justify, yet on the other hand it must be remembered that for one instance of official corruption which is made public, there are at least ten which remain secret.

A single fact, which is stated in the same report of the Prison Association from which we have already quoted, seems to indicate the wide prevalence of corruption or inefficiency. It appears that the bail bonds of criminals, though often forfeited, are never enforced. It is not easy to believe that the sureties get off thus easily without making some compromise with the officers who control these bonds; while it is certain that the State derives no benefit from these compromises.

It is hard to say anything as to the means by which these evils may be remedied. The administration of justice in this State, and no doubt in others also, has for many years been tainted with corruption; not certainly as the rule, but in cases of disgraceful frequency. In certain criminal courts, not necessary to be specified, corruption has been the rule, and honesty the exception, for twenty-five years. This state of things was not created by the elective system, for it existed before the judges were elected by the people; but it has certainly grown worse with the advance of time, and has probably been aggravated by the new system. One thing, at least, is certain, that the present division of the State into small districts for the election of judicial officers has been carried too far. To confer, as is now done, the choice of a police justice upon a district in which the majority of the houses are occupied by liquor dealers of the worst kind, brothel-keepers, thieves, and beggars, is as degrading a farce as to give a State prison the election of its warden. And that which we know to be the case in cities we presume to be sometimes the case in the country. There must be towns here and there in which the prevailing influences are of a criminal or at least immoral nature; and such towns ought not to have the power of electing their own judicial officers. We appreciate the difficulties which surround these questions. Government must in the main be administered upon general rules; and, as a general rule, it has been deemed best to entrust the town separately with the election of all town officers. A case of oppression or corruption is more likely to be known through the town than in all the county; and an offender might be, and in fact has often been, re-elected by a large district, when his own neighbors have repudiated him. But we can imagine a plan which should obviate some of these difficulties, though we shall not now enter upon it. The first duty of those who desire to reform the judicial system of the State is to awaken the public to a sense of its present defects, and of the appalling dangers which threaten us from a continuance of its downward tendency.

MR. SEWARD ON THE NEED OF THE NATION.

We are *particeps criminis* with Mr. Hunter, chief clerk of the State Department, in a fraud to the extent of two cents on the Government of the United States. We have received from that gentleman, under his frank, generally supposed to cover official business, and to be lawfully used for that purpose alone, a neatly-executed pamphlet containing Mr. Seward's last Auburn speech, and though the print has a suspicious look of the Government printing-house, we shall keep it, even at the expense of encouraging the pious error that our income tax is levied to publish and distribute Mr. Seward's personal out-givings. We shall do so, for the purpose of calling attention to these few sentences which occur on page nine, and contain the substance of the whole speech:

> "What, then, does the nation need? It needs just what I have dwelt upon so much and so earnestly in these remarks; it needs reconciliation, and just now needs nothing more. It needs, moreover, only a very little of this. It needs a reconciliation between the senators of the United States who are now acting and those senators who, being loyal and qualified for membership of the Senate, have been already, or may hereafter be, elected by the people of the several States which were lately involved in the rebellion. It needs a reconciliation of the same kind between the members of the House of Representatives who are now acting and loyal members already elected, or to be elected, by the people in the same before-mentioned States. It needs just this Congressional reconciliation, and nothing more."

It seems to us that this is a very grave mistake. Doubtless the nation needs reconciliation. But of what? Of the passions war usually engenders? They can hardly be said to exist in the North; and the people of the North, who, whether we regard their numbers, strength, fidelity to the national institutions, or hope and faith in a national future, really are the nation, need no reconciliation with the people of the South, because, practically, they harbor no hatred toward them. Nor is it fair to say that there is need that our actual members of Congress need a reconciliation with those who claim to be members of Congress, and are not, from the Southern States. Such men as Senators Fessenden, Trumbull, and Sherman have no bad feeling, and represent none, towards such men as Marvin, of Florida, or his constituents. Messrs. Boutwell, Conkling, Washburne, Wilson, of the House, have no quarrel, and want none, with Maynard or with Stokes—whom a Democratic paper, with characteristic courtesy, calls the "ribboned ox of the Radicals"—nor can there be any quarrel between the people of the North and those who sent Messrs. Maynard and Stokes to Washington.

What the country needs is something which Mr. Seward very gayly,

but entirely, ignores—the reconciliation of the conflict between "two radically different political systems," which he declared in 1858 to be impossible, and which has proved itself so by bringing about the late war, and by defying the unstinted pardons of the President and the most powerful sedatives of the Secretary of State. That these conflicting systems, in their distinctive principles, still exist, is plain from what Mr. Seward himself said about their results. Where one prevails, an aristocratic ruling class is the sure accompaniment; where the other prevails, "universal suffrage obtains, and the State inevitably becomes, sooner or later, a republic or a democracy." In the Southern States "lately involved in the rebellion" the system recognized by Mr. Johnson and his Secretary includes and, indeed, is controlled by an aristocratic ruling class, principally distinguished for their violence during the rebellion, and their defiant opposition to the principles of republican government since. The system, on the other hand, which the large body of intelligent and conscientious Republicans in the North wish to prevail, involves universal, or, what is a better phase of the same principle, impartial suffrage, and seeks the establishment of a true republic.

It is the conflict between these two that must have reconciliation; and though we believe a man has a right in a republican government to change his mind for the better, Mr. Seward was so much sounder in 1858 than he is in 1866, that we use words of his spoken then to show the incalculable and inherent superiority of the system of freedom over the system which, in all its forms, is essentially the system of slavery. Contrasting the two, he said of the former: "It opens all the fields of industrial employment and all the departments of authority to the unchecked and equal rivalry of all classes of men, and at once secures universal contentment, and brings into the highest possible activity all the physical, moral, and social energies of the whole State." Does Mr. Seward now hope for any better kind of peace than is thus promised? He pleaded, then, that that principle "conforms to the divine law of equality which is written in the hearts and consciences of men, and therefore is always and everywhere beneficent." Is there any other principle from which Mr. Seward can now prophesy any nobler or surer result?

No. Mr. Seward is, it seems to us, seriously and dangerously mistaken, and if the thoughtful men of the Republican party are inclined to follow him—which we do not fear—let them take warning from a lesson read to them from history by Mr. Seward himself:

"The Democratic party derived its strength, originally, from its adoption of the principle of equal and exact justice to all men. So long as it practised this principle faithfully it was invulnerable. It became vulnerable when it renounced the principle, and since that time has maintained itself not by virtue of its own strength or even of its traditional merits, but because there as yet had appeared in the political field no other party that had the conscience to take up and avow and practise the life-inspiring principle which the Democratic party had surrendered."

AIR AND ARCHITECTURE.

As one man's calamity is often another man's opportunity, we would make bold to suggest to our Palladios and Vanbrughs that the calamity which has just deprived us of our opera-house furnishes them with an admirable opportunity to provide us with another such as the world has never yet seen. We do not mean that they should make it an astonishment to the nations with their façades, and their pillars, and their pilasters, and their thin slices of marble or of brown stone spread over meagre scantlings of brick-work, like boarding-school bread and butter, for we shall have all that, of course. And so of the graven images, the caryatides, the cupids, the carved work, and the frescoes, for we cannot hope to escape them in new combinations of horrors. What we would humbly suggest to their better judgment is, that they should take into their grave consideration the existence of the two elements of fire and air, and exercise their genius in the invention of methods for keeping the first out of their new construction and for letting the second in. Now we apprehend that it is perfectly within the possibilities of science and art to make a theatre that shall be absolutely fireproof, and we think, moreover, that there could not be a better advertisement, not even in the New York *Herald*, for the one that shall first be made such, than the statement of the fact. Very few persons are absolutely free from the shuddering suggestion of the unescapable horrors of a conflagration, should one take place, when they find themselves in a crowded theatre. It may be a mere prejudice of education that makes one object to going up in a flame of fire, when one's time has come, but it prevails extensively and should be respected. We are well aware of the recklessness of the American race to all manner of avoidable as well as inevitable dangers. But, still, we think that a fair average even of them would prefer, the entertainment being equally good, to amuse themselves at a theatre where they should be absolutely safe from the inconvenience of being burned alive. We presume that the tenth part of what it will cost to rebuild the Academy, expended originally in making a fire impossible, would have been no bad economy for the owners. The saving in insurance alone would have paid the difference in the cost ten times over.

But, while we would have our artist in brick and mortar contrive to make the coming opera-house fire-proof, we would as earnestly entreat him to avoid making it air-proof, as the common custom is. The ancients classed air among what they queerly enough styled the *non-naturals*—such as food, rest, exercise, and some other functions which shall be nameless. One would think that this element was still regarded by our builders, and those they build for, as still belonging to the category of *non-naturals*, in the literal and vulgar signification of the compound term. But we beg leave to differ from this prevalent opinion, even at the risk of being thought radical and fanatical. We assert, with all due humility, that air is not only necessary to our animal existence, but that it cannot properly perform its wholesome offices unless it be pure. The Creator has done his part well as to this matter. The vast sea of air, at the bottom of which we creep about as fishes which Agassiz has never imagined do on the bed of the ocean stream, is constantly renewing and purifying itself by the imperative laws of its being. It is only when we can lay hold of a portion of it and confine it within walls, as nearly hermetically sealed as may be, and do our best to prevent its escape or its refreshment from without, that it becomes stagnant and putrid, and a poison instead of a healthsome draught, sparkling with invigorating life. And it is only because nature is too strong for us and refuses to permit us to defy her as utterly as we fain would do, that we are even as well off as we are. She will insist upon forcing air into our houses, public and private, and not allowing us to turn them into exhausted receivers and Black Holes of Calcutta as thoroughly as we would. Still, we are competent to disappoint her of much of her kind intentions, and to turn what she gave us as the means of health and joy into the occasion of sickness and pain and death. Many of the diseases which make life burdensome while it lasts, and bring it to an untimely ending, and especially those of the lungs, we create ourselves by our folly in transforming the *pabulum* of life into its bane.

For we would by no means affirm or insinuate that the builders of theatres are sinners above all other abusers of building-materials. Lecture-rooms, concert-rooms, school-rooms, and churches are, too many, if not all of them, in the same condemnation. Who has not felt "an exposition of sleep," like that Bottom experienced, and which sometimes leads to an exposition of himself, stealing over him at the very gayest moment of the comedy or at the blackest horror of the tragedy or melodrama? We ourself went last winter, one night, to see Booth in "Richelieu," and we cannot affirm to this hour, from our own knowledge, whether he was "the state" or not. And so of the lecture-room and the concert-hall. Indeed, not a few persons of delicate organizations avoid all public places because the murdered air they helped to kill in them haunts them the next morning in the ghostly shape of a nervous headache. For every pair of lungs is as much an apparatus for making carbonic acid gas as a chafing-dish of charcoal, and disoxygenizes (if there be such a word) more than a hogshead full of air every hour. Even the sanctity of the church is not sufficient, now the days of miracles are over, to suspend the laws of nature or to avoid the penalty for breaking them. We have been told on good authority that instances have been known of wicked men sleeping soundly under the loudest thunders of the pulpit, and that through the longest and soundest sermon! But since our churches seem to be built generally on the principle that the air, as a part of the domain of the Prince

of the Powers thereof, is to be defied and kept out of them as a religious duty, some indulgence, if not full absolution, may be allowed to these sleepy sinners. The school-houses, again, as almost universally built, seem to be contrived for the purpose of ascertaining by actual experiment with how little air small animals can do without positive asphyxiation. And private houses differ from those intended for public uses, pious or otherwise, chiefly in the smaller number of pairs of lungs that have to deal with the modicum of air which is thought sufficient for the consumption of a family.

In brief, the perversity of men has shown itself in few things more than in the pains they take to cabin, crib, and confine the freest, and to debauch and pollute the purest, of all God's gifts to man. Now, certainly, this need not be so. There must be ways by which the atmosphere of the most thronged churches, theatres, or lecture-rooms shall be as pure and sweet as the circumambient air itself. And as soon as the consumers demand that those ways shall be found out, the discovery will be sure to be made. It is the office of art, informed and inspired by science, to seek out more and more excellent ways of applying the bounties of nature to the uses of man. This is material civilization, and we are barbarians, with all our ornamentations, as long as the laws of God are not fully understood and practically applied to the business of daily life. A wide and beneficent field lies yet scarcely touched for the genius and skill of the architect to work in. He who will contrive to combine perfect purity of air with warmth and light, in crowded churches, theatres, and school-rooms, as well as in private houses, will be a benefactor to his race, and will deserve, at least, to be as famous as he who hung Peter's dome in air.

THE METRICAL SYSTEM OF WEIGHTS AND MEASURES.

THE French metrical system is based upon a fundamental unit, or measure, of *length*, called by the well-chosen name *metre*. This standard measure was sought in the sublimest of all sciences, astronomy. It is the 40-millionth part of the circumference of the earth, or, in other words, of a "great circle" or meridian. Its length was originally determined by actual measurement of a considerable arc of a meridian; from the measured length of this arc was obtained by multiplication the length of the whole meridian, and the metre was defined and constructed the 40-millionth part of this meridian. It was a worthy thought thus to base the familiar standard of length for common human uses upon the grand and unchanging bulk of our planet, but we do not thus arrive at a standard which can know no change, and which could be exactly replaced if all the actual metres in the world should be simultaneously destroyed. Though the laws of astronomy and the circuit of the earth know no variableness, man's knowledge of those laws and his skill in measuring that circuit do constantly change. Hence we find that the various measurements heretofore made of the length of the earth's meridian differ slightly from each other, and it is to be expected, and indeed hoped, that the steady improvement of methods and instruments will make each successive determination of the length of the meridian better than the preceding, through all time. Whether, therefore, we use the yard or the metre, whether we theoretically base our standard upon the earth's circumference or the second-pendulum, we are practically obliged to define our standard of length, by legislation, to be a certain rod of metal, deposited in a certain room under specified guaranties and guardianship. The uniformity and permanence of the standard are to be secured by the multiplication of exact copies in safe places of deposit.

From this single quantity, the metre, all other measures are decimally derived. Multiplied or divided by 10, by 100, by 1,000, and so forth, the metre supplies all needed linear measures, from the finest which the microscope requires to the vastest which the telescope demands. As the linear metre, decimally multiplied and divided, furnishes the universal linear scale, so the square metre and the cubic metre, with their decimal multiples, supply all needed measures of *area* or *surface*, on the one hand, and of *solidity* or *capacity*, on the other. It is the universality and comprehensiveness of this system and its decimal character which establish its claim to general acceptance. The insect's wing, a nation's territory, a grain of sand, a continent's bulk, are all measured by reference to the same unit, and the numbers which express their dimensions conform at once, without reduction or alteration, to our decimal arithmetical notation. The American people need no elaborate demonstration of the convenience of a decimal system; a decimal currency, by them first established, has convinced them on this point.

From the unit of measure to the unit of weight, the transition is admirably simple and convenient. The cube of the 1-100 of the linear metre is, of course, the millionth of the cubic metre. Its bulk is comparable to that of a large *die* of the common backgammon board. This little cube, the millionth of the cubic metre, of pure water is the universal unit of weight, a *gramme*, which, decimally multiplied and divided, is made to express all weights, from that of the dust upon the balance to that of mountains and suns. The chemist uses the gramme itself as his unit, and his delicate balances readily weigh the ten-thousandth of a gramme; the thousand-gramme weight is the unit of the grocer, and his coarser scales hardly turn with the gramme itself, while for heavy merchandise, like coal or hay, the million-gramme weight (the English ton) is the suitable unit. The numbers expressing all weights, from the least to the greatest, find direct expression in the decimal notation; the weights used in different trades only differ from each other in being different decimal multiples of the same fundamental unit; and in comparing together weights and volumes, none but easy decimal computations are ever necessary.

From this general sketch of the metrical system we pass to its details and its nomenclature, which may be best studied under the three heads of linear, surface, and cubic measure. One general principle of nomenclature applies to each of the following tables. The Greek prefixes for 10, 100, and 1,000, viz., deca, hecto, and kilo, are used to signify multiplication, while the Latin prefixes for 10, 100, and 1,000, viz., deci, centi, and milli, are employed to express subdivision. Of the names thus systematically derived from that of the unit in each table many are not often used; the names in common use are those printed in small capitals. Thus, in the table for linear measure, only the metre, kilometre, centimetre, and millimetre are in common use—the first for such purposes as the English yard subserves, the second instead of the English mile, the third and fourth in lieu of the fractions of the English foot and inch.

LINEAR MEASURE.

		Metre.
Divisions..	MILLIMETRE,	0.001 or 1-1,000 of a metre.
	CENTIMETRE,	0.01 or 1-100 "
	Decimetre,	0.1 or 1-10 "
Unit.....	METRE,	1.
Multiples..	Decametre,	10.
	Hectometre,	100.
	KILOMETRE,	1,000.

SURFACE MEASURE.

Divisions..	Millimetre square,	0.000,001 of a metre square.	
	Centimetre square,	0.000,1 "	"
	Decimetre square,	0.01 "	"
Unit.....	METRE SQUARE,	1. "	"

This table for surface measure applies to the measurement of cloth, lumber, and the like, and to the measurement of land where it is very valuable, as in cities; but for measuring land upon a large scale the metre square is too small a unit to start from, so that a square of ten metres on the side, equal to one hundred square metres, has been selected as the surface unit for measuring land, and the Greek and Latin prefixes are applied to the name of this unit square, which is called an *area*, or *are*. Of the seven names thus formed only two are much used, viz., the are and the hectare.

SURFACE (LAND) MEASURE.

		Are.	Square Metres.
Divisions..	Milliare	0.001	0.1
	Centiare	0.01	1.
	Deciare	0.1	10.
Unit.....	ARE	1.	100.
Multiples..	Decare	10.	1,000.
	HECTARE	100.	10,000.
	Kilare	1,000.	100,000.

CUBIC MEASURE.

		Cubic Metre.
Divisions..	Cubic Millimetre	0.000,000,001
	Cubic Centimetre	0.000,001
	Cubic Decimetre	0.001
Unit.....	CUBIC METRE	1.
Multiples..	Cubic Decametre	1,000.
	Cubic Hectometre	1,000,000.
	Cubic Kilometre	1,000,000,000.

The cubic metre is in common use as a measure for stone, sand, gravel, wood for fuel, and like materials which are sold by measure. When applied to the measurement of wood for fuel the cubic metre is sometimes called a *stere*, and to this name the Greek and Latin prefixes may be, but seldom are, applied.

For the measurement of wine, beer, oil, grain, and similar wet and dry substances, a smaller unit than the cubic metre is desirable. As a special unit was made from the square of the decametre for land measurement, so the cubic decimetre is selected as a special standard of capacity for the measurement of those substances which are bought and sold by the English wet and dry measures. The cubic decimetre thus used is called a *litre*.

CAPACITY MEASURE.

		Litres.		Cubic Metres.	
Divisions..	Millilitre	0.001	=	0.000,001	= cubic centimetre.
	Centilitre	0.01	=	0.000,01	
	Decilitre	0.1	=	0.000,1	
Unit.....	LITRE	1.	=	0.001	= cubic decimetre.
Multiples..	Decalitre	10.	=	0.01	
	HECTOLITRE	100.	=	0.1	
	Kilolitre	1,000.	=	1.	= cubic metre.

Of the measures contained in this table only two, the litre and the hectolitre, are in very common use, though they are all more or less employed.

The table of weights bears an intimate relation to this table of capacity. As already mentioned, the weight of that die-sized cube, a cubic centimetre or millilitre of distilled water (taken at 4° C., its point of greatest density), constitutes the metrical unit of weight. This weight is called a *gramme*. From the very definition of the gramme and from the table of capacity measure it is clear that a litre of distilled water at 4° C. will weigh 1,000 grammes.

WEIGHTS.

		Grammes.		
Divisions..	MILLIGRAMME	0.001		
	CENTIGRAMME	0.01		
	DECIGRAMME	0.1		
Unit.....	GRAMME	1.1	=	cubic centimetre of water at 4°.
Multiples..	Decagramme	10.		
	Hectogramme	100.		
	KILOGRAMME	1,000.	=	1 cubic decimetre of water at 4°.

The beautiful simplicity and directness of the relations between weights and volumes in the metrical system can now be more fully explained. The chemist or apothecary, for example, uses the gramme as his unit weight, and for his unit of volume, or measure, a cubic centimetre, which is the bulk of a gramme of water. The grocer, for his coarser work, uses the kilogramme as his unit of weight, and for unit of measure, the bulk of a kilogramme of water, the litre. A boat displaces a certain number of cubic metres of fresh water; it weighs then the same number of 1,000 kilogrammes, since a litre of water weighs a kilogramme, and a thousand litres make a cubic metre. In all commercial dealings, in all manufacturing processes and scientific investigations, these simple relations between weights and measures are an unspeakable advantage.

The number and length of the names included in the above tables may perhaps deter some minds from the really easy task of mastering this simple and consistent system. One obvious suggestion will, however, remove this seeming difficulty. Since the numerical expressions for metrical weights and measures are invariably decimal, they may always be read as decimals. Thus, 5.126 metres will be read, five metres and one hundred and twenty-six thousands, and not, five metres, one decimetre, two centimetres, and six millimetres. So, 5.26 hectares may be read, five hectares and twenty-six hundredths, or five hundred and twenty-six ares, but not, five hectares, two decares, and six ares. Or again, the expression 10.5 grammes is read, ten and five-tenths grammes; 16.56 kilogrammes, sixteen and fifty-six hundredths kilogrammes. This point will be readily comprehended by comparison with our manner of reading figures in our decimal currency. We read $105 00 one hundred and five dollars, not ten eagles and five dollars; we say sixty-five cents, not six dimes and five cents. It should be remembered, in this connection, that the metrical system of weights, measures, and coinage does away with the so-called compound addition, subtraction, multiplication, division, and reduction, and with all fractions not decimal. All computations, under this system, are made with decimals alone.

The following abbreviations are very commonly and advantageously used in writing and printing:

m. m. for millimetre; $\overline{\text{m. m.}}^{-2}$ for square m. m.; $\overline{\text{m. m.}}^{-3}$ for cubic m. m.

c. m. " centimetre; $\overline{\text{c. m.}}^{-2}$ " " c. m.; $\overline{\text{c. m.}}^{-3}$ " " c. m.

k. m. " kilometre.

m. " metre; $\overline{\text{m.}}^{-2}$ " " m.; $\overline{\text{m.}}^{-3}$ " " m.

L. " litre; Hecto. for hectolitre.

Grm. " gramme; Kilo. or K. for kilogramme.

It remains to bring the weights and measures of this philosophical system into comparison with those of the irrational and complicated English scheme, which we have so unfortunately inherited:

1 metre=1.0936 yard=3.2809 feet=39.3708 inches.
1 are=3.9574 perches=119.6033 square yards=0.0247 acres.
1 hectare=395.7388 perches=2.471 acres.
1 cubic metre=35.3166 cubic feet=1.3080 cubic yard.
1 litre=1.7608 imp. pint=0.2201 imp. gallon=61.0271 cubic inches.
1 gramme=15.4340 grains Avoirdupois=15.4424 grains Troy.
1 kilogramme=2.204 pounds Avoirdupois=2.6795 pounds Troy.
1000. kilos=2204. pounds Avoirdupois.

In making these comparisons it must be borne in mind that we now have two different weights called a pound, two different tons, and two different measures called a gallon. The two pounds are to each other nearly in the ratio of 35 to 29, and the two gallons are related to each other as 277.274 to 231.

When we extend our view beyond the territory of any single nation, and take into consideration international exchanges and the statistics of different countries, the obstacles to commerce and to the diffusion of knowledge which are due to the want of one universally accepted system of weights and measures throughout the civilized world become more and more apparent. If only the great nations had different standards, the evil would be serious, but less intolerable than it actually is, for it often happens that the different provinces of a single nation, and not seldom its petty cities and towns, employ special weights and measures whose acceptance is very narrowly local. It would be hard to exaggerate the difficulties thus thrown in the way of statisticians, and of all other students who desire to compare the experience of different nations, or the scientific researches of philosophers writing in different languages. In the sciences of chemistry and physics this evil became so intolerable that the metrical system has already come into general use among all the scientific communities of Europe and America.

The recent action of Congress is good as far as it goes; but the national Government has it in its power, as never before, to bring about this purely beneficent revolution with promptness and thoroughness. If the metrical system were at once exclusively employed in all the dealings of the Government, in all the business of the customs, the internal revenue, the post-office, the patent-office, the army and navy bureaus, and the administration of the public lands and public improvements, the people of the United States, than whom none are more prompt to seize a new thing, so it be good, will be in full possession of this inestimable improvement within five years. In the meantime it is to be hoped that the commission, which the President is authorized to appoint for negotiating with foreign governments, may be so constituted as to represent effectively the best statesmanship, business capacity, and science of the country, that they may carry weight in the council of nations. The commission is charged with the subject of coinage as well as that of weights and measures, and upon that subject American experience is of special value. Our borrowed system of weights and measures would doubtless give place to the metrical system; but for a standard of value there is no unit so deserving of general adoption, or so likely to be adopted, as the Spanish, Mexican, and American dollar.

CURIOSITIES OF CRIME.

LAST summer a curious psychological study was afforded by the confession of a Swedish pastor named Lindback, who had been guilty of poisoning three invalid paupers in his parish. So far from exhibiting any remorse for these crimes when they were detected and he imprisoned, he calmly, if not confidently, explained the process by which his mind was brought to the commission of them. A purely philanthropic spirit, fortified by the contemplation of suffering and misery, had induced him to relieve the wretched objects of his ministration by hastening their death. He had observed, he said, that very few die of years, but the great majority from some external cause which God either provides or at least does not hinder. Many, in the flower of their age, destroy themselves involuntarily through a misuse of their intelligence. Many perish under the treatment of the most skilful physicians—some being thrust back from a near recovery. Science, as well as ignorance, plays a leading part in the causes productive of death. A merciful God, he thought, who was aware of all this, would not judge him harshly for abridging the pains of his fellow-creatures.

Pastor Lindback went the way of other convicted murderers, not, probably, with the execration which attends the common sort, possibly even with pity. His reasoning was plausible, if utterly unsound; and as intelligible, supposing it genuine, as his offence was unpardonable in a court of justice. We are reminded of it by a case which has occurred in this country within sixty days, developing a state of mind sufficiently analogous to his. Mrs. Sarah Haviland is on trial at Marshall, Michigan, for the murder of her three children. She is accused jointly with a man who appears to be regarded as her paramour, and the person for whose sake or at whose instigation she poisoned her little ones. The incomplete report before us does not allow us to confirm this suspicion, which, on the other hand, is expressly denied by the mother in the latter particular, and by implication in the first. Her voluntary confession is in substance as follows: She was the wife of a drunken husband, with whom the family "could have no peace," and who frequently drove her out of doors after dark, because, to use her own words, "I believed in spiritualism." A year ago she deserted him and went to live in Battle Creek, hoping there to purchase with her own property a home for

herself and children, and to obtain for the latter the benefits of the local Lyceum. Disappointed in both respects, she would have experienced great suffering but for the assistance of her present fellow-prisoner. Her efforts to earn her support by peddling books in the streets were unsuccessful and disheartening, and increased her maternal solicitude for the future.

"I had hard work," she says, "to keep my children where they should be, the little boys especially. I had always tried to bring them up honestly, but as they grew older I saw the disposition of their father manifested in them, and I was all the time uneasy if they were out of my sight, for fear they would get to stealing or their father would get the little ones. When I looked forward to the time when my children should be grown up men and women, I feared for them that they would have to suffer by transgressing the laws of the land; and I thought as I had been the author of their existence, in a measure, it was better to send them to the spirit world while they were innocent, and if any one would have to suffer, I would do it instead of them. . . . The two little ones, John and Libbie, their father being a thief and a drunkard, I feared if he took the children from me they would walk in his steps; and, as I looked to the future, I saw a worse fate for my daughter Libbie if he had her."

The significant phrase "in a measure" is enlarged further on:

"My children, the three now dead, I was forced to have against my consent; but I did try to bring them up as well as I knew how, nor did I ever misuse them in any other way."

After describing the means she employed to poison them, she says: "I took care of my children and watched over them until the last breath." For the rest: "I feel that what I have done is to be settled between me and my God and the spirit world."

The example of Pastor Lindback forbids us to ascribe Mrs. Haviland's shocking and unnatural behavior to her peculiar religious ideas. His, which were probably the very opposite, did not deter him from deliberate murder, and he had to face not only his Maker and the spirits of those whose departure he had hastened, but, in case of condemnation, the terrors of a place of everlasting punishment. As for "spiritualism," the last charge that can be laid at its door is that it weakens the ties of kindred. It may have disturbed many households, like other theologies about which man and wife have opportunity to differ and quarrel, but the power of its propagandism lies in the proofs it seems to offer of a conscious existence hereafter and of a reunion beyond the grave. The fallacy by which each criminal was deluded differed in nothing except, as we may say, in degree, and was based upon a common recognition of human accountability. The pastor felt himself responsible for the actual misery which he might abridge; Mrs. Haviland, for the prospective misfortunes of her children which she might likewise avert. The one, perhaps, was led by his office, as the other was by her relationship, to a deed which, it was expected, God would view at least with leniency, possibly with approbation. Both reckoned up the chances of their victims and struck the balance against them, launching them at once upon a life of whose conditions they knew nothing, and upon which those who have most studiously prepared themselves are not seldom the least bold to enter.

For the mother of unwelcome offspring, Mrs. Haviland, to accept her own statements, must be allowed to have shown no lack of affection. Had she been a coward, or harbored malice towards her husband, she might have abandoned her children to their fate either before or after her flight from home. Yet it does not appear that her apprehension for their welfare was exaggerated by an excess of fondness. There were good reasons for believing that they had the disposition of their father, and she doubtless felt that her control of them was proportionate to her ability to feed and rear them, which was very slim indeed. And the moment she was seized with the notion that she would be morally responsible for their perdition and the harm they were destined to inflict upon others, she was irrecoverably lost. To her confused perception there was no self-evident absurdity in protecting society from contingent lawlessness by committing the most grievous possible offence against it.

One other case of infanticide, not to be mentioned by an American without a blush, is indelibly fastened upon the annals of slavery. Margaret Garner, at Cincinnati, killed her child that it might not grow up a slave. Men who were wont to honor the memory of Virginius, hesitated to refuse to that poor black the title of heroine. She, too, reckoned the chances and decided adversely to life—as it seemed then, with much better reason than Pastor Lindback or Mrs. Haviland. There was no sentiment about her. If she thought of the hereafter, it was only to resolve that any hell would be a refuge from that out of which she had escaped, and to which she was about to be dragged back. Far be it from us to doubt that she has found equal mercy with that hoped for by those whose names we have coupled with hers. She erred just as fatally, however, albeit more ignorantly, and rather from strength of passion than feebleness of intellect. If it is demoralizing to avoid our proper responsibility, it is also dangerous to surpass it. They are to be commiserated, even while censured, who have chosen the wrong issue from so grave a perplexity.

BOOKS OF THE DAY.

J. B. LIPPINCOTT & CO.

CHANDOS. A novel. (English.) "Ouida." 8vo. Adv. p. 717. . . . . 2 00
DEVOTIONS OF THE AGES. Rev. N. G. Allen. Collects, Texts, etc., illustrative of the Christian year. Noticed p. 635. . . . . .

"The 'English Cyclopedia' is a work that, as a whole, has no superior, and very few equals of its kind; that, taken by itself, supplies the place of a small library, and, used in a library, is found to present many points of information that are sought in vain in any other Cyclopedia in the English language."—*Quarterly Review.*

THE

"ENGLISH CYCLOPEDIA,"

IN FOUR DIVISIONS, 22 VOLS.

MONTHLY VOLUME REISSUE.

On the 15th of every month is issued a volume of each division, alternately as follows:

ARTS AND SCIENCES,	$5 00
BIOGRAPHY,	4 50
GEOGRAPHY,	4 50
NATURAL HISTORY,	4 50

And so on.

The supplementary volumes are in preparation, and will be published during the reissue.

SCRIBNER & CO. having perfected arrangements for supplying the new issue of the above standard and invaluable work, are now prepared to receive the names of subscribers. The volumes will be ready for delivery promptly on or about the 15th day of each month, COMMENCING ON THE 15TH OF JUNE WITH VOLUME I. OF ARTS AND SCIENCES.

It is well printed, in clear type, on good paper, and neatly and appropriately bound in green cloth. Its gradual appearance, at a reasonable price, places this comprehensive and sterling work of reference within the means of every family library, association, and book club in the country, while its well-known character for solidity and accuracy will be fully sustained by the supplementary publications, containing the most recent inventions and discoveries in the arts and sciences, exhibiting the progress of geographical investigation, and bringing up to the requirements of the age its unapproachable volumes on Natural History and its admirable series of Biographies.

A Specimen Volume may now be seen at our store. Orders from the trade and public solicited.

SCRIBNER & CO.,
654 Broadway, New York.

HURD & HOUGHTON,
459 BROOME ST., NEW YORK,

Will publish on Saturday, June 9:

PICTURES OF COUNTRY LIFE.

By ALICE CARY,

Author of "Clovernook," "Married, Not Mated," etc.

1 vol. crown 8vo. Price $2.

Early orders solicited.

NEXT WEEK:

THE MORMON PROPHET AND HIS HAREM; Or, An Authentic History of Brigham Young, his Numerous Wives and Children. By Mrs. C. V. Waite. 1 vol. 12mo, cloth; 4 portraits on steel. Price $2.

JUST PUBLISHED:

A BRIEF BIOGRAPHICAL DICTIONARY. Compiled and arranged by the Rev. Charles Hole, B.A., with additions and corrections by William A. Wheeler, M.A. 1 vol. 16mo, cloth. Price $2.

SHAKESPEARE'S DELINEATIONS OF INSANITY, IMBECILITY, AND SUICIDE. By A. O. Kellogg, M.D., Assistant Physician State Lunatic Asylum, Utica, N. Y. 1 vol. 12mo, cloth, gilt tops. Price $1 75.

FOR TRAVELLING AND THE COUNTRY.

THE LATEST TAUCHNITZ BOOKS.

PRICE, 75 CENTS PER VOLUME.

SANS MERCI. George Lawrence. 2 vols.
AGNES. Mrs. Oliphant. 2 vols.

LEYPOLDT & HOLT,
American Agents for the Tauchnitz collection,
451 BROOME STREET, NEW YORK.

Messrs. LEYPOLDT & HOLT have just published, in beautiful editions,
MEMOIRS OF A GOOD-FOR-NOTHING. $1 75.
LAWS OF SHORT WHIST. $1 25.

WANTED—In a Book or Publishing-House, a situation by a gentleman of foreign and American education, perfectly acquainted with the English, German, and French languages. Salary, at present, not so much an object as respectability and standing of house. Can influence considerable Pennsylvania trade. Refers to Thomas N. Dale, 17 and 19 Warren Street; Kapp & Goepp, 4 Wall Street, and others, if desired; or can be addressed, "HERMAN," Room 25, 35 Gramercy Park.

BANCROFT'S MEMORIAL ADDRESS

ON THE LIFE AND CHARACTER OF

ABRAHAM LINCOLN,

Delivered at the Request of both Houses of the Congress of America, before them in the House of Representatives, at Washington, on the 12th of February, 1866.

BY GEORGE BANCROFT.

1 vol. 8vo, with portrait, cloth, $1.

FOR SALE BY

D. VAN NOSTRAND,
192 Broadway.

NEW PHYSIOGNOMY; OR, SIGNS OF CHARACTER —as manifested through Temperament and External Forms, and especially in the Human Face Divine. With more than 1,000 illustrations. By S. R. WELLS, Editor of the PHRENOLOGICAL JOURNAL. In one volume, handsomely bound, $5. Address FOWLER & WELLS, 389 Broadway, New York.

This work systematizes and shows the scientific basis on which each claim rests. The "signs of character" are minutely elucidated, and so plainly stated as to render them available. It is in the delineation of individual character that the system finds its most useful application. The various races and nations are described. The Teuton, Celt, Scandinavian, Greek, Mongolian, Indian, Patagonian, African, etc., has each his representative. Portraits, in groups, of distinguished persons of ancient and modern times, with biographical sketches and delineations of character, render the work of interest to all. DIVINES, ORATORS, STATESMEN, WARRIORS, ARTISTS, POETS, PHILOSOPHERS, INVENTORS, PUGILISTS, SURGEONS, DISCOVERERS, ACTORS, MUSICIANS, etc., are given. It is an ENCYCLOPÆDIA of biography, acquainting the reader with the career and character, in brief, of many great men and women of the past 1,000 years and of the present—such, for instance, as Aristotle, Julius Cæsar, Shakespeare, Washington, Napoleon, Franklin, Bancroft, Bryant, Longfellow, Barnes, Irving, Rosa Bonheur, Theodosia Burr, Cobden, Bright, Lawrence, Bolivar, Whately, Thackeray, Dow, Knox, Richelieu, Hopper, Buckle, Dickens, Victoria, Wesley, Carlyle, Motley, Mill, Spencer, Guthrie, Thompson, Alexander, etc. Every feature of the book, where practicable, has been illustrated with neat and finely executed engravings. AGENTS WANTED.

ROBERT H. JOHNSTON & CO.,

IMPORTERS, BOOKSELLERS, AND PUBLISHERS,

LIVE CHICKENS ON PAPER,

In imitation of a painting in oil by A. F. Tait. It is so successful

A CHROMO-LITHOGRAPH

that even connoisseurs generally take it for the original.

Size, 10x12. Price $5 per copy.

Sold in all first-class picture stores throughout the country. Will also be mailed on receipt of price by the publishers.

L. PRANG & CO.,
159 Washington Street, Boston.
639 Broadway, New York.

FINANCIAL REVIEW.

NATION OFFICE, Thursday, June 7, 1866.

WE are beginning to receive from Europe the reply to our first gold shipments, and already a better feeling is reported to prevail on the London Stock Exchange. Our securities were in better demand, and bankers felt grateful at the unexpected aid they were receiving from this country. The news has reacted upon our markets. Gold, which had risen to 146½ on Tuesday, fell back to 144 on Wednesday; to-day at 3 P.M. it stands at 142⅝. Exchange is firmer; sixty-day sterling bills have been selling at 110, and sight bills at 111. Specie continues to go forward freely. Yesterday, from Boston and from this port, $3,765,000 were shipped, and on Saturday some four millions more will probably go. Not a dollar of the gold sold by the Government will be kept in the country. Letters have been published by Secretary McCulloch and Assistant-Treasurer Vandyke with the design of justifying the sale of fifteen millions of public gold at 130, after the news of the Euro

pean panic had been received. They are well written; but they have failed to convince the public that it was for the interests of the Government or of the mercantile community to sell the specie reserve at a price below that which it would naturally have commanded had the Government officials left the market to itself. The experience of the past four years tells very strongly against official interference with the natural workings of trade, and it would not be surprising if, before the adjournment, Congress should adopt some measures with a view to check future intermeddling with the gold market by the Treasury officials.

Money is again very easy at 6 per cent. The Sub-Treasury has been disbursing quite heavily—the balance now $87,000,000—and the banks cannot find employment for the surplus currency thus thrust upon them. People have got over the idea that there is to be any contraction; it is about time.

The stock market continues active and variable. The last novelty has been a simultaneous corner in Erie and New York Central, both of which were on Tuesday and yesterday locked up by cliques and made quite scarce for delivery. As much as ¼ per cent. was paid on each of these days for the use of the stock. The New York Central clique must have invested many millions of money in their operation. How they calculate to make it pay, is a problem. An attempt to sell would cause the price to fall 10 per cent. in a day or two. Erie continues to be the subject of angry discussion in the newspapers. The bulls are furious with the company for having borrowed money of Mr. Drew, and with Mr. Drew for having lent the money. In fact, the former had no choice but to borrow the money somewhere, and as to Mr. Drew, we judge he is the only man in or out of the United States who would lend 60 on Erie. A new movement has been inaugurated in the Northwest stocks, on the basis of increased earnings. The directors meet next week, and will probably pass the dividend on the preferred stock. Fort Wayne and Rock Island are rather lower and neglected. The clique in Reading appear to be selling their stock. Governments are well supported in the face of receipts of bonds from Europe.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	May 31.	June 4.	June 7.	Advance.	Decline.
United States Sixes of 1881	109¼	105¾ ex. int	105¾	....	....
5-20 Bonds, old	102	102	102¾	¾	....
5-20 Bonds of 1865	102⅛	102	102¼	¼	....
10-40 Bonds	95⅞	96	96	...	....

RECEIPTS for the year, over - - - - - -	700,000
DIVIDEND paid during the present fiscal year - -	69,160
TOTAL DIVIDENDS paid - - - - - - -	419,000
TOTAL LOSSES paid - - - - - - - -	944,042

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

J. W. & H. JUDD, GENERAL AGENTS.

ESTEY'S COTTAGE ORGANS,

$100 TO $500.

These popular instruments excel all others in QUICKNESS OF ACTION, ROUNDNESS, PURITY, AND VOLUME OF TONE, accomplished by PATENT IMPROVEMENTS. The crowning perfection is the

VOX HUMANA TREMOLO,

a wonderful imitation of the sympathetic sweetness of the human voice.

They are strongly endorsed by Geo. W. Morgan, Wm. A. King, Chas. Fradel, and many others, the highest musical authority in the United States.

Good Agents wanted everywhere.

Send for illustrated catalogue or call at the New Warerooms.

GEO. G. SAXE & CO.,
417 Broome Street, N. Y.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their PATENT AGRAFFE ARRANGEMENT, which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.

Topics of the Day.

THE Reconstruction Committee has at last brought in its report. We have discussed it at some length on another page. It takes the view of the President's constitutional relation to the South which we trust he by this time takes himself. There could hardly have been a greater misfortune than his getting it into his head, after his sudden and unlooked-for accession to the presidency, that he was to be the great reconstructor, and that the business of Congress was to register his decrees.

THE pardoning business in Washington is likely to receive a considerable check from the determination of the President to pardon nobody hereafter who does not apply in person. Hitherto pardons have been largely obtained by brokers in Washington, and from this business women were not excluded—a gratifying sign of the progress made by the sex in the assertion of its "rights." Pardons have, however, been granted on such a great scale that there is no longer the slightest tinge of humiliation left in the idea of being pardoned. The old sense of the remission of a penalty justly incurred has completely passed away from the word. Southerners now apply for pardons as for a seat in the opera, or a passport, as a thing which can be had, of course, on compliance with certain formalities; and in great numbers of cases people who could afford it have let agents do the dirty part of the business, the lobbying and answering questions, for them.

IT seems likely that we shall have ere long a bridge thrown across Broadway, at Fulton Street, to accommodate foot passengers, whom all the efforts of the police at this and several points below can scarcely keep from getting crushed in the press of vehicles. Bad as is the condition of our chief thoroughfare, it is a gauntlet easily passed compared with others parallel to it on either side. The annoyance and peril to which the suburban population of New York are subjected daily in going to and returning from their places of business can scarcely be overdrawn and are steadily aggravating. We venture to predict that at no very distant date it will be necessary to bridge the entire waterline of the city, wherever a ferry discharges its passengers, or a steamboat making frequent trips has its pier, and even that people may eventually walk from the North or East River to Broadway without setting foot on the sidewalk below. A very slight tax on those whose safety and convenience are chiefly at stake, would create a fund sufficient to accomplish this object. Perhaps the Fulton Street experiment will lead them to consider the matter more deeply than they seem to now.

MR. BERG, who is the moving mind of the Society for the Prevention of Cruelty to Animals, has, after having secured relief for the calves, been looking into the case of the fowls, which, it appears, are first paralyzed by having a penknife stuck into their brains, then plucked; but the fact that they are deprived of sensation before being plucked was held on the trial of a case to be a good defence to the charge of cruelty. Mr. Berg was compelled in this instance to obtain his proofs by going down himself to the foot of Dey Street and peeping into a kind of pen, and we believe most of the other cases which have been brought before the court have been ferreted out in the same manner. The amount of cruelty that can be prevented in this way must, of course, be infinitesimally small. The fact is that societies for the prevention of cruelty to animals are useful rather as a means of calling people's attention to the fact that it is our duty to treat animals kindly, than of forcing us to treat them kindly. It is, in other words, rather a kind of embodied protest against vice than a positive reforming agent.

THE generous offer of the Campobello Fenian chief to aid the anti-confederation men of the British Provinces in resisting the tyranny of Sir Fenwick Williams and other minions of the British Crown was rather scornfully disregarded. In fact he and his army of liberation probably did something to weld together the Saxon of the Canadas and him of the maritime provinces, for it is doubtful if New Brunswick and Nova Scotia would have been carried for the measures, at least by such majorities, if there had been profound peace on the border. It is not, however, a matter which greatly interests Americans. New Brunswick and Nova Scotia have both, so far as they have yet voted, voted in favor of the measure, and the confederation is now a certainty.

THE cholera, if it has been in the city yet, and that is not certain, has shown its old affinity for filthiness and wretchedness, and given us another warning that the best quarantine is cleanliness. Luckily a Board of Health physician has now at his orders the scavenger as well as the apothecary, and the presence of the disease is no sooner suspected than prophylatic disinfectants are lavished. Since our last issue three deaths have occurred which are said to have been deaths by cholera, and two cases have been successfully treated.

THE N. Y. State Agricultural Society, through its president and secretary, announces that "the Rinderpest or pleuro-pneumonia has appeared among the cows in the stables of New York and Brooklyn," and advises stock buyers and purchasers of meat to be very careful lest they buy diseased cattle or their flesh, which will "probably be offered for sale at low prices." It does not plainly appear whether the society means to assert that the disease may be Rinderpest and may be pleuro-pneumonia, and in either case should be most carefully guarded against—an assertion in which everybody will agree—or that Rinderpest and pleuro-pneumonia are identical—a statement which would hardly be borne out by the authorities, and which, if not beyond doubt, it is hardly well to make, the name of Rinderpest being exceedingly demoralizing in its effects on the bucolical mind.

THE last endorsement of Mr. Johnson appears in the "Edinburgh Review," a fact which the New York *Times* notes with great satisfaction. Previous to the appearance of this article, however, an elaborate eulogy on him was published in the "Fortnightly Review," from the pen of that acute political observer, Dr. Charles Mackay. Count Bismark has not yet spoken on the subject, nor has Prince Metternich's father-in-law, who is well known to have warmly approved of Mr. Lincoln, and would, doubtless, therefore, according to the theory of some conservatives, approve of Mr. Johnson.

A MEETING has been held in London, at which the Lord Mayor presided, for the purpose of taking steps for the erection of a monument to Mr. Peabody. His lordship made a somewhat incoherent speech, in which he said that one of the objects they had in view in erecting the statue was to show to every American who might find it convenient to reside in England that he might be sure of a warm welcome and the highest appreciation on the part of the people of England. This is all very fine, but the opinion of the better portion of the English public, in which most people here will share, is that the very poorest return that could be made to Mr. Peabody for his munificence would be to put up a statue to him in the streets of London. The statue is in the first place sure to be ugly, and in the next place would be in two years so begrimed with soot that the dearest friends of the original would never guess whose virtues it was intended to commemorate. The spectacle of Mr. Peabody in bronze or marble, with a smut on his nose and looking as if he had passed the night in the gutter, would certainly not be a cheerful one even for the Americans who "find it convenient to reside" in England. A working-man who attended the meeting made a much more sensible suggestion, which was to form, by popular subscription, a fund for the relief of destitute Americans in England. This class is perhaps too small to make it worth while to provide organized relief for it, but the plan has in it the germ of something better.

A CONGRESS has, it is said, been agreed on for the settlement of the Austro-Prusso-Italian difficulty, but in spite of the general repugnance with which both the French and German people view the war, there is very little chance of a peaceful settlement. Congresses called at the eleventh hour are rarely expected to terminate difficulties of such magnitude as the present one, and, it is but right to add, would hardly be agreed to by the parties in interest if it was supposed it would result in peace. The only chance of avoiding war now lies in the death or abdication of the Prussian King. In the meantime the day for the commencement of hostilities as fixed by the Austro-Italian treaty was the 28th of May, but the Congress may have secured a postponement.

FRANCE was to have had its eleventh census completed in the latter half of last month. It will only confirm the well known tardy increase of the French population, which, in 1861, including Savoy and the Maritime Alps, amounted to some thirty-seven and a half million souls. The past five years, it has been observed, have been unusually exempt from the three scourges of war, pestilence, and famine, and afford the most favorable opportunity of ascertaining the normal growth and progress of the nation. Roughly estimated, the number of births in France yearly may be set down at 1,000,000 against not less than 800,000 deaths, which is about one-fourth the rate of increase across the Channel. The depletion of the rural departments to the advantage of those which contain great cities, has reached an alarming extent. In the decade 1851–1861, the department of the Seine gained upwards of half a million inhabitants, though the total increase throughout France was less than a million. The humors of the census are not wanting in the present instance. It is made soberly to appear that women preponderate in the pulpit, in civil office, at the bar, and in the practice of medicine. This arose from enumerating in the same columns, as belonging to the *personnel* of a profession, all those who are supported by it; that is to say, not only the barrister, but the barrister's wife and daughters and maids; not only the priest, but his sisters, nieces, and female servants.

CONGRESS.

WASHINGTON, June 9, 1866.

THE constitutional amendment being safely through the Senate, the House is expected to consider it on Wednesday, June 13. Protracted debate is not likely to occur, since the only very material change made by the Senate consists in substituting for the third section, disfranchising rebels, a milder provision excluding a certain portion of them from office.

The National Department of Education fares hardly in the House of Representatives. It was beaten by two votes on Friday, although first amended so as to reduce the annual salaries of the proposed officers to $9,400. It is a notable fact that every Democratic representative, with thirty Republicans, voted against it.

The resolution adopted in the House to adjourn on the 28th inst. has since been referred to the Ways and Means Committee. The Senate has yet to consider the details of three or four of the most important measures of the session, including the tax bill, the general appropriation bill, the Freedmen's Bureau extension, and the bankrupt bill. For the latter there is not much chance, and the House has not yet touched the tariff bill. On the whole no adjournment before July 15 seems possible.

DIARY.

June 6.—In the Senate, a bill was passed to reduce and re-organize the clerical force in the Department of the Interior. The constitutional amendment was discussed by Messrs. Howe, Doolittle, Hendricks, Sherman, and Cowan. Mr. Doolittle offered an amendment, apportioning representatives, after the census of 1870, according to the number of legal voters in each State by the laws thereof; lost—yeas, 7; nays, 31.

In the House, a bill was passed requiring every disbursing officer of the United States to deposit public money only with the Treasurer or Assistant-Treasurers of the United States. The bill authorizing the Secretary of the Navy to accept League Island as a naval depot was debated by Messrs. Kelley, O'Neill, and Le Blond, in its favor, and Messrs. Brandagee and Hubbard against it.

June 7.—In the Senate, Mr. Davis spoke four hours against the constitutional amendment.

In the House, the League Island bill was opposed by Messrs. Spalding, Raymond, Pike, and Rice, of Massachusetts, and defended by Messrs. Myers, Thayer, and Kelley. Mr. Brandagee offered a substitute, empowering the President to appoint a commission to report upon a proper site for naval purposes; rejected—yeas, 55; nays, 64. The bill in favor of League Island was then passed—yeas, 71; nays, 46—with a proviso requiring the navy-yard at Philadelphia to be removed thither. A resolution to adjourn Congress the 28th day of June was passed—yeas, 69; nays, 39.

June 8.—In the Senate, the constitutional amendment was opposed by Messrs. Johnson, McDougall, and Hendricks, and defended by Messrs. Henderson, Yates, and Howard. Mr. Doolittle moved that the several sections of the amendment be submitted to the States as separate articles; lost—yeas, 11; nays, 33. The joint resolution proposing a constitutional amendment was then passed—yeas, 33; nays, 11. Adjourned to June 11.

In the House, a bill to establish a National Department of Education was opposed by Messrs. Randall and Pike and defended by Messrs. Moulton, Banks, Boutwell, and Garfield. The bill was amended to reduce the salary of the Commissioner of Education from $5,000 to $4,000, and to strike out two out of five clerks to be employed. A substitute for the bill, providing that two clerks, under direction of the Secretary of the Interior, shall perform the duties prescribed, was rejected—yeas, 53; nays, 67. The original bill was then rejected—yeas, 59; nays, 61.

June 9.—The Senate did not sit. In the House, speeches on reconstruction were made by Messrs. Van Aernam and Clarke, of Kansas. Indian affairs were discussed by Messrs. Burleigh, Allison, and Wilson, of Iowa. Adjourned to June 11.

THE FREEDMEN.

SOME time since, in Virginia, North and South Carolina, and Georgia, the assistant commissioners of the Bureau were ordered to perform also the duties of military commanders. The same change has now been made in the case of assistant commissioners C. B. Fisk, of Tennessee, Jefferson C. Davis, of Kentucky, Absalom Baird, of Louisiana, and Wager Swayne, of Alabama. General Ruger, the military commander and assistant commissioner in North Carolina, has been relieved by Gen. J. C. Robinson.

—In York County, Virginia, at a place called Bartletts, the white citizens, who are said to have manifested unceasing and increasing hostility to the school there, at last, on the night of May 20, burnt the school-house which had been sent out by the Friends Association of Philadelphia, and on the next morning, Superintendent Vining reports, "fired several cannon, evidently in exultation, over the ashes."

—Outrages continue to be reported by agents of the Bureau in Maryland. At Easton, in that State, a few Sundays since, a respectable black man, while on his way to church, was shot and killed by a party of the young gentlemen of the neighborhood, returned rebel soldiers. The murderers are said to be skulking in the woods.

Notes.

LITERARY.

At last, after a labor of sixteen years, Mr. S. Austin Allibone has completed his *magnum opus*, the greatest bibliographical undertaking of this country. In a letter to a friend, dated May 30, he says: "The dictionary of authors which I projected in 1850, and commenced preparing for the press Aug. 1, 1853, was completed last night at twenty-seven minutes after eight." Those who have used Mr. Allibone's first volume, and have become acquainted with its excellences, will be eager for this second and concluding part, which will soon be published by Mr. G. W. Childs, of Philadelphia. The book contains the sum and essence of all bibliography. It is a ready guide to the writings of all the world's authors.

—The North American Indians, their legends, and customs, have furnished material for the works of Schoolcraft and Catlin; Prescott and Wilson have written of the history of the conquest of Mexico; and Squier and Stephens have investigated the ancient monuments of Central America; but no American, we believe, has set himself to enquiring in a scientific manner into the early religion and folk-lore of the Mexicans and Peruvians. What few accounts we have of their legends are scattered through numerous volumes. Yet the subject is one which is well worthy of the most serious study not only as regards the early history of this country, but with reference to comparative mythology, a branch of enquiry which is daily growing in interest and importance. Some of these Central American legends have been investigated and translated, and theories of the Mexican and Peruvian theogony have been propounded by European scholars, which are almost the only attainable sources of information at present. The celebrated Hero-song of the poet-king Netzahualcoyotl can be found in the Otomi text in Granados y Galvez, "Tardes Americanas. Mexico. 1778," and a translation in the fifth volume of Klemm's "Allgemeine Culturgeschichte der Menschheit." The Botan-Saga and other connected legends are fully treated of by Ternaux-Compans: "Essai sur la théogonie Mexicaine," and also in Karl Rafn's "Mexicanske Oldsager, in Cabinettet fer Americanske Oldsager." The work of J. G. Müller, "Geschichte der amerikanischen Urreligionen," published at Basle, in 1855, is especially valuable for the thorough criticism of the sources of information on this subject. The numerous but less critical books of the Abbé Brasseur de Bourbourg, a diligent worker in the field of old American history, are not to be passed by. Especially important are his "Histoire des nations civilisées du Mexique et de l'Amérique Centrale," and his "Popol-Vuhi; Le livre sacré et les mythes de l'antiquité Mexicaine." The latter is a translation from the Quichua manuscript. When Mexico becomes more settled, it will be possible to make investigations among the native inhabitants, whose Catholicism is hardly a varnish over the original heathenism. Much oral tradition must remain among them of their early gods. It is to be regretted that no student of mythology accompanied Agassiz on his expedition up the Amazon, for much might be learned there from the Indians of the upper country, who have not yet had their native legends infected by the importations of travellers and missionaries.

—Among the recent attempts at glossaries of special periods and authors none is more deserving of praise than "The Bible Word-Book," by the late Rev. J. Eastwood, and Mr. W. Aldis Wright, the librarian of Trinity College, Cambridge. This is a small volume containing a glossary of all the words in the authorized version of the Bible and in the Book of Common Prayer which are there used in a sense different from that which they bear at present. The authorized version does not represent the actual language of 1611, but it is a mosaic of all the different translations that were made, beginning with Tyndale's New Testament, in 1525. The illustrations of the senses of the obsolete words used in the Bible are, therefore, scattered through all the literature of this period. Many of these illustrations, from over a hundred authors, Mr. Wright has here brought together, for Mr. Eastwood died after forming the plan of the book, having done but little to its execution, and the result is a valuable hand-book not only for all readers of the Bible, but for all readers of the English literature of the sixteenth century. Several books of this kind have been projected before, one of the best known of which is Dean Trench's essay "On the Authorized Version of the New Testament," very good as far as it went, but limited in compass. This book of Mr. Wright's leaves little to be desired. Besides the explanation of the meaning of the words and the illustrative passages, an etymology is in most cases added. The book is published by Macmillan & Co., and is very cheap.

—Shakespeare literature shows little falling off. The seventh volume o the most excellent Cambridge edition of Shakespeare is just out, and the eighth, which completes the work, will follow soon. Messrs. Hurd & Houghton have recently issued an interesting little book, by Dr. A. O. Kellogg, of the Utica Lunatic Asylum, on "Shakespeare's Delineations of Insanity, Imbecility, and Suicide." The author endeavors to show that the knowledge of the condition and proper treatment of unsound minds has made little advance since Shakespeare's day, and that if Shakespeare was not the chief physician to Bedlam, he ought to have been, by as good right as he ought to have been a lawyer, according to Lord Campbell. Mr. J. O. Halliwell is preparing for publication, for subscribers only, "Illustrations of the Life and Writings of William Shakespeare." His purpose is to issue in a series of folio volumes a collection of elaborate treatises on Shakespeare's life and works, and on subjects which elucidate them, profusely illustrated with wood-cuts of ancient objects and fac-similes, and printed in the best possible style. After the subscription-list closes, no more subscribers will be admitted and no more copies will be printed. The wood blocks will be destroyed, a seemingly barbarous act, but necessary to prevent their subsequent use. All communications respecting the work may be addressed to the author, at 6 St. Mary's Place, West Brompton, London. The "German Shakespeare Society," which was founded a year ago at Weimar amid the applause of the German and English public, held recently its anniversary meeting. The society complains that though their efforts are to cultivate the study of German literature as well as of Shakespeare, and to elevate the German stage, yet they have met with small success, and the publication of the "Shakespeare Annual" did not increase their numbers. They do not, however, despair, and as they have still 573 thalers in the treasury they are going to continue their work for at least another year.

—From the volume of Drayton's poems published by the Roxburghe Club, under the editorship of Mr. J. Payne Collier, which contains many poems which have never been published since 1594, we learn some interesting facts which point to a personal animosity between Drayton and Shakespeare. In 1594 Drayton published his "Matilda," containing the complimentary mention of Shakespeare's "Lucrece," which had shortly before been published:

> "Lucrece, of whom proud Rome had boasted long,
> Lately reviv'd to live another age,
> And here arriv'd to tell of Tarquin's wrong,
> Her chaste denial and the tyrant's rage," etc.

These lines also appear in the second edition of "Matilda," but were always after that omitted. Three years after Shakespeare's death, Drayton boldly plagiarized the well-known passage in "Julius Cæsar" (act v., scene 5), in a stanza of his "Barons' Wars," where he simply expanded Shakespeare's three lines into eight:

> "He was a man, then boldly dare to say,
> In whose rich soul the virtues well did suit;
> In whom so mix'd the elements did lay,
> That none to one could sovereignty impute;
> As all did govern, so did all obey;
> He of a temper was so absolute,
> As that it seemed, where Nature him began,
> She meant to show all that might be in man."

Even in 1603 this passage had a faint likeness to that in "Julius Cæsar;" but it was not until 1619 that almost the very words of the original were adopted. In the same edition the words of the next stanza have been so rewritten as to afford a striking similarity to another passage of "Julius Cæsar" (act iii., scene 2):

> "So that their wounds, like mouths, by gaping wide,
> Made as they meant to call for present death,
> Had they but tongues, their deepness gives them breath."

These resemblances may, indeed, have been mere accident; but the suppression of the passage in "Matilda" certainly seems to point to an intentional appropriation of Shakespeare's words and images in the two other cases.

—M. Guizot has published a new instalment of his contribution to the most popular literature of the day—that which concerns the origin and history of Christianity. The volume is called "Meditations on the Actual State of the Christian Religion." The volume which he had promised on the origin of Christianity he has postponed for the present, probably to make it more responsive to Renan's "Apostles." The first part of the book presents the picture of the Christian revival in France since the beginning of this century. The second offers a brief explanation and a judicious and rapid appreciation of the systems of philosophy, rationalism, materialism, pantheism, etc., that dispute the ground with religion. The book is well written, and quite equal to the former volume of "Meditations" published last year.

—In the last number of the "Journal of the Royal Asiatic Society" is a specimen of a proposed Assyrian dictionary by Mr. Edwin Norris, the secre-

tary of the society. Mr. Norris was the assistant of Sir Henry Rawlinson in preparing for publication many Assyrian inscriptions, and has collected a large number of words with the received interpretations on which most decipherers of the cuneiform inscriptions are agreed. The publication of this dictionary will assuredly do much for the study of those interesting monuments, and will greatly facilitate investigators who have not the patience to begin from the beginning, as did Dr. Hincks and Sir Henry Rawlinson. If the Asiatic Society do not undertake its publication, its importance certainly deserves that it be printed at Government expense. The other contents of the journal are an interesting essay on some questions of the Vedic theology and mythology, containing a discussion of the Asvins, by J. Muir; translations of some of the hymns in the Rig and Atharva Vedas, by the same; five hundred questions on the social condition of the natives of Bengal; an account of the Malay MSS. belonging to the society; a translation of the Amitâbha Sûtra from the Chinese; and a disquisition, by Edward Thomas, on the initial coinage of Bengal.

—Even though one has the latest editions of Johnston's and Kiepert's atlases, it is found very hard work to obtain accurate information of all parts of the world, or even of those that are well known. It is very fortunate, then, that a new edition of Mr. M'Culloch's valuable "Geographical Dictionary" is being issued, and certainly no person can be thought of fitter to revise and prepare the new and enlarged edition than Mr. Frederick Martin, the author of "The Statesman's Year-Book." The first volume, from A to Caspe, a closely-printed octavo of 600 pages, has just been issued by Longmans, Green & Co. It is a very great improvement on the former book, as many changes have taken place and discoveries have been made in the twenty years since that was first published. Some errors, of course, there are, as in many cases the editor does not seem to have consulted the latest authorities.

HENRY HUDSON.*

Hitherto, in point of extent and accuracy, the antiquarian's and the schoolboy's knowledge of Henry Hudson have been very nearly the same. That England was his native country was generally admitted, though some writers, misled by a translation of his christian name, have given him to Holland; it was on record that he made voyages for the Muscovy Company and one voyage for the Dutch; it was certain that, seeking a short passage to India, he was the first of white men to sail on the waters of Delaware Bay and the Hudson River; and his melancholy fate was known—that the adventurous captain was abandoned by his cowardly and mutinous crew to a death of misery, thrust out to perish on the icy, frightful shores of that inland sea which still bears his name. But his early history, his parentage, his education, his training as a seaman and discoverer—all these have been folded in obscurity so complete as hardly to have furnished food for conjecture even, and his latest biographer declares that "his doings before the 19th of April, 1607, his family connections, his social position, are equally unknown to us."

He makes his first appearance abruptly, as a man well known, in the pages of Purchas, one of whose Pilgrimes is the "worthy, irrecoverable discoverer, Master Henry Hudson." On the 19th of April of the above-mentioned year, Hudson and eleven others, mariners, partook of the sacrament of the communion in the church of St. Ethelburge, they being then about to set sail for the pole. It was a voyage undertaken for the Muscovy Company, and its object was the discovery of a northeastern passage to China. Taking this as a fixed point, Mr. Read proceeds to the study of his subject, and by some unearthing and collation of disregarded passages in old writings, and some ingenious argumentation, and a little ingenious guessing, he constructs what seems a very probable account of Hudson's career. The weak links in his chain of reasoning he hopes to see strengthened hereafter by documentary evidence which is accessible to English enquirers, and he points out some sources whence he expects the proofs that will convert his hypothesis into certainty. A brief statement, showing the manner of his investigation and giving its results, may be of general interest.

The Muscovy Company, or Russia Company, or Company of Merchant Adventurers, or Society for the Discovery of Unknown Lands, or Fellowship of English Merchants for the Discovery of New Trades, for by all these names it was known, was first chartered by Queen Mary in 1555. Fifty-two years afterwards Hudson, as we have seen, is a captain in the employ of this corporation. Now, on examination of the company's charter, it is found that one of the original corporators was named Henry Hudson. Reading in Hakluyt, it is seen that in 1560 another Hudson, Christopher, is a prominent factor and the company's agent in Russia. In 1580 a Thomas Hudson, of Limehouse, now a part of London, was a captain in the company's service. The identity of these men's names with that of the most renowned of the Muscovy Company's navigators, certainly a striking coincidence, seems to have escaped the notice of all preceding investigators, the reason probably being that the name of the elder Hudson Hakluyt spells Herdson. But this same Henry Herdson of Hakluyt, in the "Proceedings of the Court of Chancery," reign of Elizabeth, Vol. II., p. 24, is called Henry Hudson. The name of Christopher Hudson, Hakluyt himself gives variously, spelling it Hudson, Hodson, and Hodsdon. Indeed, not to dwell too long on a point with which most general readers and all students of the orthography of English names are quite familiar, the fact is stated that the name of Hudson may be found in more than twenty forms, some of them as different from each other as Hodderde from Hugeson, and both from Hoddesdonne. Henry Hudson the elder was a gentleman by birth, a man of great influence, an alderman of London, an enterprising merchant whom trade made wealthy, and a large purchaser of landed property. Thomas Hudson, his son, was likewise a person of consideration, and this the author proves by quotations of curious passages from the private diary of Dr. Dee, the astrologer, which show that this Hudson kept high company. He lived at Mortlake, very near London, and the records of that parish may show conclusively the degree of kinship between him and our Hudson. Another son of Henry Hudson's, called Henry after his father, was also a citizen of London, as is proved by "Stow's Survey," and by two entries in the books of the Court of Chancery. Christopher Hudson, there can be no doubt, was a relative of these men. He was probably the son of Sir Christopher, of the manor of Leighton Bussarde, in Bedfordshire, for the two are found joined as defendants in a suit concerning that property. In his "Index to Heraldic Visitations," R. Sims tells us that the Leighton Bussarde Hudsons were from Herts, and that the Hudsons of London and those of Kent were also from Herts.

Getting so far Mr. Read urges that the Harleian manuscripts be examined by English enquirers, for they would doubtless throw a flood of light on the question under discussion. The coats-of-arms given in the Harleian collection have already been found "very valuable in this connection." Probably, too, the papers of the family of Barne, now Barnes, would aid in elucidating the relationship between the Bedfordshire and London Hudsons. For when Christopher Hudson was absent in Russia he was informed by letter that Sir George and Lady Barne had stood his friends; and in 1580, G. Barne, son of Sir George, was lord of the manor of Leighton Bussarde. These two facts seem to show that the Hudsons and the Barnes were akin, and furthermore we know that, like the Hudsons, the Barnes were largely interested in the fortunes of the Muscovy Company. As for Christopher Hudson, he attained the first rank in the company, and his influence was at its height only six years before our Henry Hudson, master of a company's ship, made his famous voyage to Spitzbergen in 1607.

Hudson the discoverer also was, like most of the Hudsons mentioned above, a citizen of London, as may be seen by referring to the "Larger Discourse" of Abacuck Prickett. That he belonged to an influential family is proved by the fact that in 1612 vessels were sent out to search for him by order of Henry, Prince of Wales, and by the Muscovy Company, although the voyage in which he was lost was not made for that corporation but for Sir Thomas Smith, who was at the head of the East India Company. The records of that company, by the way, may contain some information, Mr. Read thinks, about other voyages which Hudson may have made for it. And as to what influential family this of Hudson's was, a little light may be got from the history of Captain John Smith, of Virginia. Smith knew Hudson before the latter made his voyage in 1609. To have known Hudson previously to that time he must have known him between 1604 and 1606, when the two were in England together. Now Smith was then eager for the settlement of Virginia. So were William Barne and John Hudson and Sir Thomas Smith and, in particular, Richard Hakluyt, who was so close a friend of Hudson's and whose name the navigator gave to a promontory which he discovered. Most likely Smith and Hudson became acquaintances and friends "on account of their similar tastes and mutual acquaintances."

It becomes pretty certain, then, that Hudson the discoverer was the descendant of the wealthy Henry Hudson of London, the relative by blood of the honorable family of Hudsons of Leighton Bussarde, and a connection by marriage of Sir George Barne's and other good families. Also, it is altogether probable that he received his early training "under the fostering care of the great corporation which his relatives had helped to found and afterwards to maintain." It is very well known that the Muscovy Company had indentured apprentices of two classes, traders and navigators, the latter class

* "A Historical Inquiry Concerning Henry Hudson, his Friends, his Relatives, and his Early Life, his connection with the Muscovy Company, and Discovery of Delaware Bay. By John Meredith Read, Jr." Albany: Joel Munsell. 1866. Pp. vi. 209.

being composed of more adventurous lads than the former, but both being recruited from families of means and influence. This theory of Hudson's youthful training accounts for his frequent employment by the Muscovy Company and for his earnestness and enthusiasm in the search for the short route to the Indies—a discovery which was one of the two great objects for which the Muscovy Company was formed, and a problem which called forth so much of the emulous daring of the wonderful seamen of that wonderful age.

Even as the case stands at present, we are rather inclined to believe than to doubt that the additions to the materials of history which Mr. Read's ingenuity and laborious research have given us are as correct and valuable as he thinks them. We trust that the explorations now making in England may completely verify the statements of his essay and that their results he may give us in another essay as interesting as this.

A CRITICISM ON OUR SCHOOLS.*

The anonymous author of this interesting pamphlet will be looked upon as a benefactor by the intelligent friends of popular education everywhere. His conclusions may not be received in all their breadth, but they will not on the other hand be slighted; and he, we are sure, will be glad to see them combated, as they have already been in some quarters, because they will then certainly obtain the consideration which they merit. The careful collation of the school systems and statistics of several States—Ohio, Pennsylvania, New York, and Massachusetts—is a service rarely performed for the public at large, and welcome even to superintendents and professors.

The author's thesis is: that the schools which do the substantial work of instructing the people—the daily public grammar schools, beyond which the vast majority of pupils never proceed in their studies—are shamefully neglected; that the high and normal schools, on which so much attention and money have been bestowed, and which, however much held up, do not by any means fairly represent our national condition educationally, are failures and a fraud on tax-payers; and, finally, that it is the duty of the State to confine itself to the thorough teaching, by the most competent persons, of the simplest branches of knowledge, and leave to private enterprise and endowment institutions fitted to give a more extended training to those who may desire it. In brief, we need the widest possible *diffusion* of knowledge, and the few have no right to special enlightenment at the expense of the many.

There are here, it will be seen, a great many points for discussion. Unhappily, the proofs are only too numerous of the general poverty of our common school appointments, especially in the rural districts; of the insufficient wages of teachers, and of a disposition on the part of parents to avoid even the requirements of the law, to say nothing of their obligations to their offspring, for the sake of the few dollars that may be saved by shortening a term. Every one knows, who has travelled at all away from the cities, the character of the district school-house, set commonly in the most desolate place the neighborhood affords, and looking like a relic of two centuries ago rather than a part of the active machinery of the present day. Inside and out alike uncomfortable, uninviting, often a blotch on our civilization; the product of the unrefined ways and deplorable apathy of the surrounding population. The author has not overdrawn the picture of these deformities, though he has not perhaps fully accounted for them; and we think his theory might have been still further modified if he had justly appreciated the causes of the meagre pay accorded to teachers. On this point incidentally he has spoken with the greatest earnestness and force, and has manifested an admirable sense of the inequality under which women labor in competition with men. We are inclined to believe that here should be fastened a good deal of the odium which he has attempted to transfer to the high and normal schools.

For the last, it is unnecessary to say that our author will have against him all the State boards of education and the chief functionaries of public instruction. Their testimony uniformly asserts the value of these institutions in elevating the standard of education in every department. Mr. Anson Smyth, the superintendent of schools in Cleveland, very ably defends the high school, on the ground that it gives popular respectability to a public school system, and stimulates ambition in the pupils of the grammar schools, of which it furnishes a large number of the teachers. He even goes so far as to say: "Strike down the high school, and every other department would stagger under the blow." Mr. George W. Minns, on the other hand, the principal of the California State Normal School, agrees with our author that it is a mistake to qualify teachers for any but the common schools, and hence that "an extended course of instruction in the arts and sciences or in the languages" is out of place. The subject is a very tempting one, and we should like to pursue it further if space permitted. Our own opinion is, that the public would not be wronged by the continuance of all the grades of free schools now in operation, but that very great improvements are desirable in them all—improvements which a few more pamphlets like the one before us would contribute powerfully to bring about. If we trusted less to systems and more to personal appeals, less to examination committees and more to public discussions and lectures on the duty of education, we should witness a very different feeling from that which now prevails in the community. The difficulties of the school have their root in the home, and the blast that shall arouse the parents is the one most needed. When their eyes are opened to the importance of the grammar schools, they will be the last to demand that the high and normal be abolished.

*"The Daily Public School in the United States." J. B. Lippincott & Co., Philadelphia. 1866.

Patriotic Poems. By Francis De Haes Janvier. (Philadelphia: J. B. Lippincott & Co. 1866.)—A recent English writer, criticising poetry, seems inclined to think that the number of different metres which the poet has at command furnishes some sort of a test of his poetical power. It is a test that would have its practical conveniences. Should it once come into general use the immensely disproportionate labor of the readers of verses would be reduced, and of the two classes it would then be the writers who would have to work the harder. But this is not to be hoped for. It is just as well, perhaps. The new standard would do a good deal for many poets, and would, for instance, put Mr. James Percival's claim to the revered appellation beyond the doubt which now exists in his case; one half-page of a modern Pindaric ode maker would guarantee fame. But on the other hand how worthless would such a test be in the case of Mr. Janvier:

> "Glory to God! we humbly bend
> In grateful adoration;
> And mingled prayer and praise ascend—
> Thanksgiving from a nation!"

The mere fact that his "Laus Deo," a hymn of thanksgiving to the Deity, and the profane "Yankee Doodle," both run in the same metre would be held proof of the most pinching poverty in respect of rhythmical forms, and of the author's consequent worthlessness as a poet. We should have to condemn as a stupid person, hopelessly prosaic, without taste and without thought, a man who has found publishers for a book of "Patriotic Poems," the contents of which are printed on beautiful, tinted paper with the widest of margins to the pages, and every line of which, if we except a few on the subject of "Rams," begins with a capital letter. A stanza copied from the last named piece will show that capitals were not dispensed with in some of its verses without good reason:

> "After these there came Rams
> not inclining to fights—
> Rams resembling good Josh-
> -ua's Gibeonites—
> Which were drawers of wa-
> -ter—Hydraulic Rams—
> Quite domestic and com-
> -monly found with their Dams!
> May such Rams still contin-
> -ue to thrive and increase,
> With the limitless Ram-
> -ifications of peace!"

It is evident that if it is once determined to begin the alternate lines at all and then to begin them in the middle of a word, beginning them with small letters is allowable. We cannot but think, however, that they are thus without the sole claim which otherwise they, in common with the rest of the book, would have to the name of poetry, and on the whole we would recommend to Mr. Janvier that in future editions these alternate verses be stricken out.

Four Years of Fighting. A volume of Personal Observation with the Army and Navy, from the first battle of Bull Run to the Fall of Richmond. By Charles Carleton Coffin. (Boston: Ticknor & Fields. 1866.)—How far contemporary critics are justified in praising a book because, though not useful now, it may possibly be of some use to posterity, we are not prepared to say. But Mr. Coffin's volume may be read with some pleasure by us of to-day, whether or not it fulfils his anticipation and goes down to the future historian. It is a book which makes evident the very decided difference between fresh news and stale news, for once it was letters from the seat of war and then it was read with an eagerness, in many homes with a trembling eagerness, which contrasts with the somewhat languid interest it awakens now. But not in this generation can the story of the war lose its fascination even when it is poorly told, and Mr. Coffin does not tell it badly. He was rather above the average of war correspondents in ability and education. And in all parts of the country, from the very outbreak of hostilities to their close, wherever events of most interest were occurring he was very apt to be within eye-shot. Perhaps his only literary merit is perspicuity. We could wish he less often fell into a fault which we suppose may be due to his efforts to be clear—a way of popping out pellets of sentences which reminds us of bean-shooting. "Life was a blank. She had lived in her master's family and was intelligent. She was the daughter of her master. She was high-toned in her feelings. The dancing and shouting of those around her were distasteful. It was to her more barbaric than Christian. She was alone among them. She felt her degradation. Freedom could not give her a birth-right among the free." The author often writes in this way. It is

possible that the translations of "Les Misérables," which war correspondents used to study for the sake of the description of Waterloo, have overpowered his judgment.

THE EUROPEAN CONGRESS.

EXCEPT in the Italian peninsula we have now in all Europe the spectacle of a sort of moral insurrection of public opinion against war. No greater contrast could be imagined than what we witness on both sides of the Alps. What do we see on the southern side? A whole people preparing for the final struggle—the Parliament, the King, and all parties unanimous for war; 25,000 volunteers rushing to arms in a few days at the name of Garibaldi; the patriotic ardor of the nation silencing all personal interests, endangered by an unexampled financial crisis; twenty millions of people adopting the same *mot d'ordre*, and shouting to-day "Venice!" with as much unanimity as they did "Rome!" a year ago; an avowed determination to accept any ally, whoever he may be, who may help Italy to fight her last battles; a sort of cold and calculated ardor which throws all minds forward, certain as they are that a defeat would soon oblige France to protect the new kingdom of Italy.

On the other side of the Alps what a difference! Let us look at France first. Here nobody was prepared for war; the Liberal party was by degrees and amidst many difficulties conquering a little more ground. Its voice was no longer despised; the debates of the parliament were once more becoming worthy of a great people. The Emperor himself, amidst all the triumphs of peace and civilization, felt that his own despotism was losing its sternness and severity; the political atmosphere was changing by degrees, less terror and hatred was diffused through it. Strong as our sympathies are with Italy we fear that a new war, which may perhaps give her Venetia, will not give us liberty. But it is not only our liberalism which is alarmed, it is also our patriotism. For if war should begin, in the present confusion of Europe it is impossible to see how and where it will end. Bismark, who has deceived Austria in the question of the Danish duchies, may deceive us also, though he may at first be our ally. Indeed, he owes it to his own reputation and to his professed principles. Though the actual position of affairs has nothing alarming for France, we cannot but think of the dangers which may arise when once Italy will be satisfied, when Austria will have settled her difficulties with Prussia at the expense of the smaller German states.

But the hostility to war seems even stronger in Germany than in France. From the Northern Sea to the Adriatic, from the Rhine to the Vistula, we hear nothing but imprecations against the bold minister who speaks of inaugurating a policy "*of fire and blood.*" Above the noise of the petty passions, hatreds, and jealousies of the German governments, great or small, is heard a solemn and lugubrious note, which every hour and every day grows more audible. It is the protestation of the Germans against a war which they consider a civil war, against a policy which they deprecate as a secession from the German Bund. In vain do the governments speak to their martial ardor; in the armies themselves the professional spirit of the *état-majors* does not descend in the ranks; the Prussian regiments of the *Landwehr* openly denounce Bismark. It is not among the workmen of Westphalia or the peasants of Silesia that this great minister could now "breathe freely," as his Imperial friend in France says he does among our laboring populations. No imprecations are heard against young Blind even in Berlin, and Bismark probably still wears the coat of mail which saved his life from the hands of this young fanatic.

In order to form a correct view of the feelings of the German people, you must read the resolutions passed at Frankfort in the great meeting which took place in that old free town. Nobody dared to advocate openly the Bismarkian policy. The friends of Prussia, Gotharians, Hégémonisten, members of the National-Verein, merely spoke in favor of the neutrality of the smaller states, a neutrality which, in my opinion, they could no more preserve than Kentucky or Tennessee did theirs in your great war. The democrats who have left the National-Verein openly attacked the centralizing policy of Prussia; their ideal is a federation of states similar to the American confederation, and in order to hinder Prussia from becoming a great military despotism they are even willing to side with Austria in the present struggle. How is it that war finds so much favor on the south of the Alps, so little on the north? The reason is very apparent and need not be sought among very high considerations. By war, Italy can gain a province; by war, Germany can only lose one. Since she has conquered the Danish duchies and Kiel, the port which she coveted, Germany has no further territorial acquisitions to make. No matter how many small states you give to Prussia and how much you add to the kingdom of Fritz, Germany, as Germany, must lose something by these arrangements, for the Gaul will ask for his part. This sentiment is clearly perceptible in the resolutions of the Frankfort meetings and in the language of the German press. The Germans would not regret much, perhaps, the loss of Venetia (though, in 1848, the revolutionary and democratic parliament of Frankfort declared that the line of the Adige was essential to the security of the German Confederation), but they would probably not be resigned as easily to the loss of the beautiful provinces of the Rhine, which they consider a part of their natural domain.

The universal resistance of public opinion to war in Germany has already borne its fruit; the proposition of a congress, very timidly brought forward at first, is now adopted. "Vite un Congrès," sung Béranger, under the Restauration, at the time of the Congress of Laybach. But then congresses were the meetings where kings decided the fate of peoples; now the people force the kings to sit round the tables of congress, even if they would prefer to ride in front of their armies.

Is there, however, much to expect from this approaching congress, which will meet the 5th of June? I dare not venture to say so. I do not see how it is possible to give even a half satisfaction at the same time to Italy, to Austria, to Prussia, to Russia, and to France. While diplomacy will be at work on her *toile de Pénélope*, more than two millions of men will be under arms; perhaps Garibaldi will get restive and will throw the spark into the magazine. It strikes me that the sovereigns who are to decide our destinies are less anxious to avoid war than to throw the responsibility of it on each other. Among all these Cæsars none will cross the Rubicon first. If Austria is willing to abandon Venetia to Italy, which I suspect she is, she may be indemnified either by the Principalities, or by some Turkish provinces, Montenegro, Herzegovina, Bosnia, and even Albania; Prussia may be satisfied with the Danish duchies; but how will the accounts be settled between Prussia and the French Emperor? There, I fancy, will be the great difficulty, as the present events have inflamed German patriotism to such a point that the annexation of even a small province to France in the Rhenish territories will meet with great difficulties. Let us, however, trust in our great ruler and often repeat to ourselves, "l'Empire, c'est la paix!"

A. L.

PARIS GOSSIP.

M. BACH'S DREAM.

PARIS, May 25, 1866.

THE report of the singular adventure which has created so great a sensation here—viz., the revealing of a couple of airs and the words of a song to M. Bach, of this city, in a dream or vision—determined your correspondent to undertake a visit to that gentleman in order to ascertain from him what amount of truth there might be in the romantic story that has so deeply stirred the curiosity of this lively and incredulous city. Accordingly, having learned the address of M. Bach, I proceeded to the house indicated, No. 8 rue Castellane, opening out of the broad and busy rue Tronchet, just behind the Madeleine. To my great vexation I found that M. Bach had ust flitted, driven away, probably, by the enormous rise of rents in that part of the town; the portress, however, gave me the new address of the professor, No. 61 Avenue des Ternes, and thither proceeded your correspondent only to find that the descendant of the great Sebastian was taking, with his family, advantage of the sunny holiday, and was away for the afternoon. But, being bent on seeing M. Bach, and learning from him the particulars both of the "vision" itself and of the yet more surprising events which are said to have happened since then in connection therewith, I went again to the house two days ago, and had the satisfaction, at last, of finding him at home.

Having sent in my card, I was ushered into the parlor, where I saw the beautiful old spinet which holds so prominent a place in this strange affair. The parlor—the picture of neatness and order—shows evident traces of the refined and antiquarian tastes of its master. The clock over the mantelpiece dates from the time of Louis XIII.; the prints on the walls are all old and interesting; bits of old porcelain and other stray waifs of the past are scattered about the room, the centre of which is occupied by a long case of ancient coins, whose collection has been one of the "favorite pleasures" of the professor's life. The precious spinet, of oak, ornamented with much fine carving, tasteful gilded arabesques, intermingled with turquoises and gilded fleurs-de-lys, is placed, for the present, on a harmonium that stands near one of the windows.

As it may not have been given to all your readers to see a spinet, let me describe the curious old instrument in question.

The spinet is to the modern piano what the black and bitter sloe is to the golden "magnum bonum," or luscious "green gage," of modern gardening. It is the small, weak, modest beginning of the long series of "improvements" which have resulted in the glorious scope and tonality of Erard's pianos. It consists of a box, about a metre and a half in length

rather more than half a metre wide, and without legs, so that it was portable, like a violin, enclosed in a case. When played upon, the spinet was placed upon a table, or on the old-fashioned stand, shaped like an X, and called after that letter. The greater part of the box is occupied by the wires, very small and weak in comparison with those of a modern piano, but disposed in the same way. In the front of the spinet is a key-board, containing four octaves, identical with those of the piano in point of musical sequence, and the white and black keys arranged in the same order, but of smaller dimensions. These keys, when played upon, move a set of wooden sticks, about the size of a finger, the tops of which are furnished with metal points that strike the corresponding wires.

My contemplation of the particular spinet which has now become so famous was interrupted by the entrance of its owner, who, being made acquainted with the object of my visit, assured me of his perfect readiness to inform me of all the circumstances of the affair. I must premise that M. Bach, great-grandson of Christian Bach, one of the sons of the immortal Sebastian Bach, is himself between sixty and seventy years of age, in delicate health, but in full possession of all his mental faculties, a busy composer, and highly esteemed by his brother artists, both as a musician and as a thoroughly upright, honest, and amiable man. He is very well known in this city, having come hither when very young, received his musical education at the Conservatoire, and resided here ever since, engaged as a composer and teacher of music. "My son Louis picked up this instrument," said M. Bach, "at a bric-a-brac shop. Knowing my liking for curiosities of the kind, he at once presented it to me. Being, as you see, of remarkable beauty and finish, and in so unusual a state of preservation, this acquisition afforded me very lively satisfaction. I wished to learn something of its history, but the dealer from whom Louis had bought it could only tell him that it had just been brought from Italy, by the person from whom he had purchased it, shortly before. I spent most of the day in examining my new treasure, and, at last, having, as I thought, ferreted into every part of it, I discovered the inscription: '*Roma*, 1564,' showing where and when the instrument was made. I amused myself with examining and playing on the spinet during the evening, and went to bed with my thoughts still running on my new acquisition. During my sleep I dreamed—as you have seen it stated in the journals—that a foreigner, elegantly dressed in the costume of the French court in the middle of the sixteenth century, with the pointed hat, slashed garments, broad-toed shoes, and numerous ribbons of that day, came towards me, bowing and smiling, and told me that the spinet now in my possession had formerly belonged to him, having been presented to him by his master, King Henry III., whose favorite musician he was; that the king had been greatly in love with the beautiful Princess Marie of Clèves, Marquise d'Isly, whom he had first seen at a hunt, and wished to marry her, but that this lady had died in a cloister; that the king used often to sing a song he had composed in memory of her, and that he (the musician) would then usually play a 'saraband' he had composed, to amuse the king in these moments of sadness; that the man in the dream had then sung and played the song and the saraband on the spinet, and that he had wakened in tears, touched by the pathos of the song." In short, M. Bach repeated the whole story, as your readers may remember it, vouching for the truth of the published account in every particular, even to the finding, to his unbounded amazement, of the copy of the two airs and the words, which he saw lying upon his bed when he opened his eyes next morning.

This mysterious production, which Mr. Bach showed me, is written on the blank half of a sheet of music paper, on the other half of which he had been engaged, the day before, in writing down something that he was in the midst of composing. The notes are written like those now in use, but the clefs are different, so that it has been necessary to transpose the song and the saraband (both of which have been published) into those in ordinary use. The words of the song, like the notation, are written very small, with extreme neatness and delicacy, apparently in pencil, and many of the letters are formed with the exploded "Gothic tails" in use in the time of Henry III.

The historic particulars since discovered by M. Bach and his friends show that an Italian musician, named Baldazzarini, or Baltazarini (for the name is variously spelt), was in great favor with Henri III., and also that the young Princess of Clèves, whom the king fell in love with at a hunt, was shut up by the ambitious and unscrupulous queen-mother in a convent, where she was believed to have died of poison. The old and rare *Journal de l'Etoile*, a sort of gazette then published, and now to be seen at the Bibliothèque Imperiale, adds that the king went to the convent and demanded to see the corpse of his lady-love, but that the abbess refused to let him do so, alleging that "decomposition had begun," but, in reality, it was thought, because she feared that the traces of poison would be discovered.

But the strangest part of this strange story is still to come. M. Bach assures me that, at the period of his dream, he had never even heard of the so-called "spirit manifestations" of modern times, and that, being utterly unable to account for the page of written music found on his bed, he was immensely perplexed, agitated, and troubled by the occurrence. "The dream alone," said M. Bach, "would have struck me as a very remarkable one; but, still, I should have regarded it as a dream, and should not have been made uneasy about it. But what was I to think of the tangible, visible proof of somebody's having been really there, afforded by the presence of this written music, this actual copy of the verses I had heard in my dream?" He spoke of the occurrence to his friends, who mentioned it again to all their acquaintances, and a host of literary men, artists, and others came to see him and to hear the surprising recital from his own lips. Altéric Second published a full account of the occurrence in the *Grand Journal*, from whose pages it was copied far and wide. And as, among the numerous visitors attracted by the strange story, came several firm believers in the developments of modern "spiritualism," M. Bach soon arrived at the conclusion that the occurrence in question was of this nature.

"About a month after my dream," continued M. Bach, "I had a violent headache and a nervous trembling of my hand that I could not account for. I felt ill and uneasy. Suddenly, having heard of 'writing mediums,' the thought struck me, 'perhaps Baltazarini is wishing to make me write!' I can't imagine what put the idea into my head; but I took a pencil and held it on a sheet of paper. I lost my consciousness at once, and my hand wrote a verse of four lines saying that the king had given the spinet to Baldazzarini. The turn of this verse being obscure, my hand then wrote as follows: 'King Henri, my master, who gave me the spinet you possess, had written a *quatrain* on a piece of parchment, which he had nailed inside the case, and sent to me. Some years afterwards, having to take a journey, and fearing—as I took the spinet with me to play on—that the parchment might be torn off and lost, I took it off, and, that I might not lose it, I put it into a little hiding-place to the left of the key-board, where it is still.'

"As at that time my spinet had been lent to the Retrospective Museum in the Palace of Industry, I could not ascertain whether this was true or not. But as soon as the spinet was brought back to me, my son and I searched carefully for this parchment, but could see nothing of it. At last, having taken it almost to pieces, we found a niche under the hammers so small that we could not get at it without taking out several of them; and there, hidden under the dust and cobwebs of three hundred years, we found a piece of parchment, blackened by time, thirty centimetres long, seven and a half wide, on which, when we had cleaned it, we found the verse alluded to, and running thus:

"'Moy le Roy Henry trois octroys cette espinette,
A Baltazarini, mon gay musicien,
Mais sis dit mal sõne, ou bien [ma] moult simplette,
Lors, pour mon souvenir dans l'estuy garde bien.'"

This parchment, which your correspondent has seen and copied, has a nail-hole in each corner; it is also pierced all around with a multitude of very small holes, which seem to show that it has been nailed all round with very fine nails. The writing and signature are exactly similar to those of Henry III. in authentic documents, and there can be no doubt that the piece is authentic, however obtained.

"No one could imagine," continued M. Bach, "the meaning of the word *ma*, surrounded by a line, as you see. But one day my hand was again moved involuntarily, and these words were written: '*Amico mio*,' the king joked about my accent in the verse he sent with the spinet. I always said *ma* instead of *mais*."

M. Bach and his friends have told me a number of other particulars relative to this singular affair, all extremely marvellous and all confirmatory both of the occurrence and of the historic truth of the statements thus strangely made; but these I really dare not give in this place, lest some of your readers should begin to doubt the sanity of your correspondent, who, faithful to the duty of a mirror, has but given you a faithful reflex of one of the topics which has been exciting the curiosity of the Parisians.

The unexpected length which my letter has already reached warns me to lay down my pen without venturing to enlarge on the remaining notes on my tablets, or describing the unrivalled collection of whistles made by M. Clapisson, and now sold by auction; the "Parlor Volcanoes, starry and perfumed, price fifty *centimes*," which are ousting the odious "Serpents of Pharaoh" from Paris drawing-rooms; the absurd literary quarrel between Edmond About and Paul Féval; or the "new and splendid" plan of the Quadrilateral, now being hawked about the streets in anticipation of the war which is keeping Europe so long in the agony of the doubt of "To be, or not to be!"

STELLA.

THE REPORT OF THE COMMITTEE ON RECONSTRUCTION.

THE Committee of Fifteen, after six months of constant labor and anxious thought, have presented their final report to Congress. Including, as it does, some of the ablest minds in the legislature, and having had unrivalled opportunities for obtaining information, the conclusions of the committee are entitled to the respect of those who may differ from them, and will, so far as they relate to practical measures, command the unanimous assent of all who intend faithfully to adhere to the party which carried the war to a successful close. A great majority of that party would, we are convinced, prefer that Congress should go further than the committee have ventured to recommend, but they will none the less cordially support the propositions of the committee, so far as they go.

These propositions, which may now be considered certain of adoption by Congress, and almost certain to be ratified by three-fourths of the States at present lawfully organized, are in the form of constitutional amendments, providing, (1) for the extension and protection of civil rights in accordance with the new law on that subject; (2) for the distribution of representation substantially upon the basis of suffrage, but without holding out inducements for the enfranchisement of women or of rebels; (3) for the exclusion from all offices, national or state, of certain classes of forsworn rebels; and (4) for the security of the national debt, and the repudiation of all claims on account of emancipation or rebel property destroyed in the war.

The third of these propositions was substituted in the Senate for the scheme of temporary disfranchisement originally reported by the committee. The change makes the general plan far less severe in its operation upon the Southern people, without diminishing in the least the actual security given to the nation. The common sense of the public almost unanimously pronounced the original plan impracticable, and therefore declined to discuss its abstract justice. We believe that loyal men generally were pretty well agreed that it would not have been literally *unjust* to have excluded rebels and their sympathizers from voting for many years, but it was plainly impossible for the general Government to enforce their exclusion from the ten or twenty thousand polls of the South; while the existence of such a restriction would lead to a vast amount of perjury and prolong the bitterness of the war. The solution of this difficult question finally reached by the Senate is very satisfactory.

In support of the measures of legislation proposed by it, the committee have just made a further report, corresponding to that which in French legislative proceedings is called an *exposé des motifs*. This report is an able state paper, drawn up with the consciousness that upon it a great party must take its stand, and that upon its reasoning Congress must depend to maintain its position before the country. It will be universally read, and deserves a careful study.

The report first sets forth the difficulties under which the committee labored in procuring the commonest information respecting the condition of the South. Six weeks elapsed before a single item of authentic intelligence could be obtained from the President, and then all that was furnished consisted of copies of the new constitutions in three States, some newspaper paragraphs relating to one other, and not a particle of information concerning the other seven States! The committee make no comment upon this extraordinary fact further than to say that the evidence was incomplete and unsatisfactory. But this simple statement conveys a terrible sarcasm upon the statesmanship of the high official who, on such a beggarly array of facts, did not hesitate to urge upon Congress the instant admission of all the eleven States, and actually vetoed a bill because that body did not obey the advice which he founded upon newspaper scraps! Or, if we are to assume that he had better statistics at hand, we must accept the equally unwelcome conclusion that he sought to force Congress into following his recommendations while deliberately withholding from it the documents upon which he had formed his own opinion.

The committee fully justify the deliberation with which they have acted. They found it necessary to examine into the affairs of eleven States, each having its own special characteristics, with a view to prescribing a uniform rule for all. The work was hastened by the appointment of sub-committees, each having a district in charge. But, under the most favorable circumstances, it necessarily occupied a long time; and there is more danger that the investigation was not thorough enough than that too much time was bestowed upon it.

The report makes some excellent points in support of its conclusions. The fact that the new constitutions or amendments thereto, and the ordinances repealing or repudiating the acts of secession, were not submitted to a popular vote, is dwelt upon with emphasis. (We may here remark that there were three exceptions to this rule, and that the fact that the Executive did not give the committee correct information upon the subject is another illustration of the neglect with which he treated the requests of Congress for such information.) The significant circumstances that none of the States embodied a denial of the right of secession in their constitutions, and that, with one exception, none of them have declared their ordinances of secession null and void *from the beginning*, are also referred to. The odious insolence and ingratitude of the South, in return for the generous spirit of forgiveness and clemency manifested by the victorious North, are set forth in calm but forcible language.

The most important feature of the report is, however, its emphatic assertion of the exclusive jurisdiction of Congress over the whole subject, and its refutation of the claim made on behalf of the Executive for the control of all questions pertaining to the reconstruction of the Union. On this point the committee use no uncertain language, while scrupulously observing the respect which every co-ordinate branch of the Government should show toward the others. The report says: "As President of the United States, he had no power except to execute the laws of the land. *Those laws gave him no authority over the subject of re-organization.* . . . It was not for him to decide upon the nature or effect of any government which the people of these States might see fit to adopt. This power is lodged by the Constitution in Congress. . . . We cannot, therefore, regard the various acts of the President in relation to the formation of local governments in the insurrectionary States, and the conditions imposed by him upon their action, in any other light than as intimations to the people that, as commander-in-chief of the army, he would consent to withdraw military rule just in proportion as they should, by their acts, manifest a disposition to preserve order among themselves, establish governments denoting loyalty to the Union, and exhibit a settled determination to return to their allegiance; leaving it with the law-making power to fix the terms of their final restoration to all their rights and privileges as States of the Union. . . . Any other supposition, inconsistent with this, would impute to the President designs of encroachment upon a co-ordinate branch of the Government, which should not be lightly attributed to the Chief Magistrate of the nation." Again, at the close of the report, the committee say:

"All the so-called legislation of State conventions and legislatures has been had under military dictation. If the President may at his will and under his own authority, whether as military commander or chief executive, qualify persons to appoint senators and elect representatives, he thereby practically controls the organization of the legislative department. The constitutional form of government is practically destroyed and its powers absorbed in the Executive. And while your committee do not for a moment impute to the President any such design, but cheerfully concede to him the most patriotic motives, *they cannot but look with alarm upon a precedent so fraught with danger to the Republic.*"

These are words of true wisdom, bravely spoken, from the right quarter and at the right time. Every reader of constitutional history knows the vast importance of public precedents. Scarcely any of the usurpations which it cost England years of struggle to escape, originated in any evil design. A king or a minister believed that the public good might be promoted by a temporary stretch of power. The power having been once used, the next king exercised it for his own aggrandizement, and the next to please a favorite, until the people found that a yoke had been fastened upon them which might in time bow them to the earth. It behooves the people of America to take warning by the

experience of their ancestors. The President of the United States is invested with powers which make him far more independent of the people, during his term of office, than any monarch of England has been for generations past, or ever will be again. Under the pressure of a terrible danger and of a supposed necessity, one half of the nation cheerfully acquiesced in usurpations of power by Mr. Lincoln which it is now settled were justified by no law. Under the pressure of a supposed political necessity, the other half are now urging Mr. Johnson to usurpations far more dangerous, inasmuch as they would be irremediable if once successful. The act of Gen. Burnside, in banishing Vallandigham, has been in effect set aside by the recent decision of the Supreme Court, and no more constitutes a precedent than the rebellion itself, though acquiesced in and even indorsed by Congress. But if Congress should, in a moment of weakness, yield to the dictation of Mr. Johnson, and admit the persons elected, in pursuance of his orders, by a constituency into which he admitted and from which he excluded those whom he deemed it right to admit or to exclude, the precedent would be one disastrous beyond calculation, and, being entirely beyond the control of the courts, could never be got rid of.

It is, therefore, the first duty of Congress to stand firm upon this point—that the election of its members shall not be in any way interfered with or regulated by the President, or by any officer of his appointment, except in pursuance of some positive statutory enactment. No matter though his interference was made from the best of motives; no matter if it was indispensable to preserve order, or indeed indispensable to secure an election at all; no matter if in the case in hand its results were for good unmixed with evil, it is the sacred duty of Congress to reject such elections without hesitation. The result of submission may to-day be unqualifiedly good, but for to-morrow it is inevitably evil, and evil only. We rejoice that the committee have seen this so clearly, and stated it so well. This country is placed in fearful peril for the future by the growth of executive power in the past, and if there must be a conflict between the executive and legislative departments, let it come now and be determined once for all. A despotism established by revolution will be speedily overthrown by revolution; but a despotism established by slow encroachment may last for centuries. Far better will it be that traitor violence should break up this Congress, as has been threatened, and that we should pass under the yoke of Davis and Vallandigham for four years, than that we should transmit to our children an unbalanced Constitution and a legislature elected and acting under the dictation of the Executive, in accordance with solemn precedents sanctioned by both the great parties of our day.

In asserting the power of Congress to summon conventions in the disorganized States, the committee maintain a doctrine which we have heretofore urged in these columns, and suggest the question why they have not recommended provision by bill upon this subject. We presume that they have been actuated by a desire to come to a compromise with the Executive; but if so, we cannot see why they should not have so stated. Our own judgment has been that Congress should exercise this power. We cannot but think it dangerous to admit the revolted States to their former share in the Government merely upon the faith of ordinances which, as the committee show, are not really binding upon their people, and which never, directly or indirectly, received the sanction of a majority of the electors. Yet this, after all their keen criticism of the pretended process of reconstruction, is what the committee propose. It certainly cannot be the plan really preferred by any member of the majority, and is an extremely liberal offer of compromise with the President and his friends. If it is not accepted, we sincerely hope that Congress will resolutely act upon the doctrines rather than the positive recommendations of this report, and commence the work of reconstruction at the very foundation.

In conclusion, we congratulate Congress and the country upon the firm, temperate, and dignified tone of this admirable paper. Coming from a committee which has been made a target of abuse, which has been charged with atrocious designs, with usurpation and corruption, and, by inference, with an intent to introduce the guillotine and the assassin's knife, the report is almost uniformly calm in its tone, free from any evil imputations against its adversaries, and apparently unconscious of the storm of denunciation that has beaten upon its authors. Yet no speech in Congress, however violent and bitter, has manifested a sterner resolution, a more inflexible determination, than it does. There is far more strength and firmness in it than in any of Mr. Johnson's incoherent speeches. There is far more real dignity in it than in any of Mr. Seward's tawdry despatches.

TO GOVERN WELL, GOVERN LITTLE.

We have learned by bitter experience that large uneducated communities are unsafe members of a family of free states, and that the education of all the people is therefore an interest of national magnitude. Conventions of teachers, a portion of the press, some representatives in Congress, and many thoughtful persons, who have a keen sense of the great dangers of dense popular ignorance, are urging the establishment of a National Bureau of Education, though a bill for that purpose has just been defeated in the House. Before we abandon ourselves to a pleasing confidence in this remedy for the admitted evil, it would be well to have a clear idea of the nature and functions of such a bureau. If we accept the French or German idea of a bureau of education, we shall establish at Washington a new department of the Government, comparable in dignity and powers with the War Department or the Post-office Department, with its secretary, its undersecretaries, and its regiment of clerks, educating its teachers at special schools, commissioning them after suitable examinations, assigning them to their stations, determining and paying their salaries, inspecting their work by general inspectors, promoting them according to seniority or merit, and pensioning the superannuated or disabled. Local school-taxes would no longer be voted in town meeting or city council, unless as supplementary to national grants, but instead thereof a new and enormous item would appear in the national accounts; local school committees would disappear and national inspectors would traverse the country in their stead; a rigid, uniform system of military precision and universal applicability all over the country would supersede the existing diverse, variable, and purely local methods. The boys of Maine, Florida, and California would turn over the same pages of "Robinson's Arithmetic" or "Hillard's Reader" at the same hour of the day, and all teachers, whether in Massachusetts, South Carolina, or Wisconsin, would be alike independent of local control, trained in the same methods, and governed by the same rules and the same central authority.

To describe this system is to demonstrate its absolute inapplicability in America. It is a system entirely consonant with the traditions and habits of a nation which accepts its government as a grace of God, and order, education, religion, and a modicum of individual liberty as a grace of the government. But such an instrumentality, though logical and, perhaps, expedient, or even essential, in France or Prussia, would be productive of infinite harm and little good among us, and would be so inconsistent with the American love of local self-government and respect for individual rights in the delicate matter of the education of their children, that the establishment of such a bureau would find few if any advocates. That the European departments of public instruction are useful to their people is, therefore, no argument for the creation of an American bureau of education, for any bureau to be established here must be utterly unlike the European bureaus in nature and functions. The only possible work for a bureau of education at Washington would be, first, the collection of statistics concerning education all over the country; and secondly, the publication of these statistics and other appropriate information at the public expense and for gratuitous distribution. The federal Government has not even the constitutional right of inspecting existing schools, much less the power to compel the establishment of new ones. In these days of constitution-mending it is, perhaps, unsafe to mention so serious a defect in the work of the fathers, lest another amendment should be hastily added to the list, already formidable enough; but it is clear that a bureau of education at Washington could have, under the existing provisions of the Constitution, no other function than the collection and publication of educational statistics and information, and that for the discharge of even this limited office it would have no special facilities. Nearly every Northern and Western State has already a secretary for education

or State superintendent of schools, and bulky reports upon the condition, statistics, wants, and prospects of their schools and colleges are annually printed. More unsatisfactory reading than these reports it would be hard to find. In Massachusetts statistics of reasonable accuracy and completeness are procured by making the forwarding of certain prescribed returns a preliminary condition to the receiving of aid from the considerable State school fund. But even in Massachusetts, the Board of Education has no power to enforce compliance with the statutes of the State concerning education, as abundantly appears in every recent report of the board. In the greater number of States, the education reports are avowedly incomplete and untrustworthy upon the most important matter, the school statistics, and they are too frequently full of commonplace crudities about popular education and of indiscriminate laudation of schools and colleges which every competent judge knows must be very defective and greatly in need of just criticism. If State officials in their own States cannot collect accurate educational statistics, what chance would a national official have, who would bring no superior powers or better facilities to the task and who would have to encounter in all the States a jealousy of national interference, and in the Southern States a bitter antipathy to education in general and to the Government's education in particular? To arrive at any trustworthy results, such an official would have to be clothed with extraordinary powers never delegated to the central Government by the States, and in themselves repugnant to truly liberal principles and to wise practice.

It can hardly be pretended that a bureau of education should be established simply for the purpose of diffusing information about educational methods, books, discipline, and the like, among the people. There is already information enough on such points accessible to all who want to be informed. The truth is that, under stress of extraordinary difficulties, we are tempted to resort to remedies which constitutional limitations and the well-considered and deliberately chosen practice of peaceful times should alike warn us against. Since the war began there has been exhibited a marked tendency to bureau-making. Some of these bureaus, like the Bureau of Navigation and the Freedmen's Bureau, are avowedly mere temporary necessities which the war created and a well-established peace will end. But others, like the Bureau of Agriculture and the so-called National Academy, seem to have been permanently established, and we are further threatened with a Bureau of Manufactures and a Bureau of Education. Now these bureaus may possibly be so ineffective as to do no great harm in themselves, but they all have one mischievous effect. They propagate and give countenance to the grave error that Government agencies have the power to foster and promote these great national interests. It should never be forgotten that all real growth and progress in agriculture, commerce, manufactures, science, or education is from the people, never from the Government. The Government may hinder, but cannot help; a bureau may record progress, but never originate or cause it. In matters touching education, science, or manufactures, the best instructions which the people could give to their chosen representatives would be—let us alone. The loyal States certainly feel no need of Government interference in their educational affairs. The true function and bounden duty of the national Government in the Southern States is to keep the peace between all classes of citizens, and to make life, property, and personal liberty as secure there as they are in New York. Genuine freedom of speech and action really secured, cotton, education, and suffrage may be safely left to take care of themselves. Those that want and work for either will get it.

A SOUTHERN ELECTIONEERING DOCUMENT.

In the end of March last the Texas Reconstruction Convention had just adjourned. Its action on most of the questions brought before it had displeased loyal men within and without the State. Governor Hamilton, for one, was known to be thoroughly dissatisfied, and a number of his fellow-citizens in Austin, being of like mind, requested him to make them a political address. This he had long before promised himself he would do. Driven from the State at the beginning of the rebellion when to stay at all would have been courting death, and to stay and speak out would have been death upon the instant, he vowed that he would yet return and live a free citizen in Texas, exercising the right of denouncing secession and all its works. He therefore complied readily with the invitation of his friends.

Evidently his oration is the harangue of a Texan to Texans. "You say we acknowledge the Constitution of the United States! Almost every one acknowledges that much when they are under, and the adversaries' thumbs are in their eyes, and hands upon their throats." Beyond a doubt it is the far South-west which speaks in that; the metaphor was taught by customs happily local. But the Union men of Texas have printed the speech, and it circulates as an electioneering document. The orator of the day really was the new party in the South speaking plainly to the whole people of Texas—expressing passionate, bitter feelings as well as political opinions, for the skeletons of Union men are still waving from the limbs of trees in Texas, and bleaching unburied in the weather; expressing political opinions less guardedly and warily, perhaps, than it may be expedient to express them in the party platform, for parties work in harness; expressing, therefore, not the present, not the immediate future, but the distant future of the State, yet still uttering sincerely the true voice of the Union party South, and, therefore, to be heeded by the South, which the party is one day to govern, and by the North, to which for some time to come it must look for encouragement and help as it proceeds to make certain what the war made possible—a North and South really one.

Perhaps the first thing which strikes the reader is the Unionists' trusting reliance upon the Government and belief in the extent of its power. "There is a power in the Government," the speaker says, "which will protect the people whatever may be their opinion or their color. . . If we will not make a republican form of government for ourselves, it will be made and given to us, and we will [shall] not be asked whether or not we accept of it." And by the general Government, he warns his hearers, he does not mean President Johnson alone; "You secessionists are trying hard to take that view, men who cannot repress their hate against the Government and are continually spitting their venom upon it, who are not only traitors to the Government but traitors to truth and freedom and will live and die so," and who are vainly hoping that Andrew Johnson may turn traitor first to his own history and then to his country. But Congress is a part of the Government as well as the President, and the part which the South is most concerned with; and when he says Congress he means the majority in Congress which the secessionists like to call Sumner's and Stevens's crowd, but which, as secessionists will find, really represents two-thirds of the loyal people of the United States. And in his republican form of government there is a place for negro voters. "In the name of God, if a negro has as much sense as I have, and as much honor, and more philanthropy, he is a better man," and a negro certainly ought to vote as soon as he is prepared for it; not before he is prepared for it, unless the conduct of the secessionists makes it necessary. Negroes once voted in North Carolina, he reminds the audience. They vote now in New York, and a single negro in the State of New York may determine by his vote who shall be President of the United States. This is no part of the creed of the secessionists, of the infamous political leaders who lied to the people of Texas and deceived them till they were induced to make war on a Government which most of them loved; who believe the horrible doctrine, that the laboring man ought to be kept ignorant and at the will of the capitalist; who proclaim that the free school system of the North is a magnificent failure! These men will not let "the negro vote because he is not educated, and they will not let him be educated because they do not wish him to vote." But they tax him to educate their own children. They declare, in the face of facts, that the nigger won't work; "and fair-haired young men, who have not done an honest day's work in all their lives, are asking, Where shall we get laborers? But the question is, Will white men work? They will not in this country if they can help it."

So the speech goes on strenuously maintaining the doctrines of the federal supremacy over States, of the inviolability of the national debt, of the danger of trusting unrepentant rebels who laugh at the oaths they take, of the right of all men to be the equals before the law of any men, and the right of all men to try to be the equals of any men in all respects.

These are not new truths, but it is new to hear them from the stump in Texas, where hitherto "the ready rope and the convenient limb" have been the simple machinery by which all opinions were reduced to one pattern, and that a very different one from this; and it is strange, indeed, to know that there is actually in the field, prepared for a political campaign, with a full ticket of candidates, an organized party which contends in Texas for what might be called the true Northern principles, if it were not better to call them the true Southern policy. And before it attains power, only too long before it can attain power, it will have purged itself from the only one of its distinctive marks which its friends in the North would gladly see obliterated—the bitterness of its natural hatred against its adversary.

ROADS.

About this period of the year there is, all over the Union, or at least all over the Northern States, a general repairing of the roads. The frost is fairly gone. The scars the snow and the winter torrents have left on the highways have to be removed. The season for riding has fairly set in, and ways have to be made safe and pleasant for the great swarm of buggies, wagons, rockaways, barouches, gigs, and chaises, which issue from their winter hiding-places as soon as the spring mud has dried. The roadmasters, contractors, and selectmen accordingly go to work with great zeal and assiduity to put the public highways in order, and the way in which they attempt to do this is so extraordinary that nothing but long habit prevents the public from enjoying its absurdity. There is, perhaps, no way in which we can bring the nature of their process so fully home to the mind of our reader as by stating that, except in very rocky or mountainous districts, there is, perhaps, hardly a mile of road north of Mason and Dixon's line which, after receiving the last touches from the road-mender, is not capable, if the traffic on it be suspended, of producing a luxuriant crop of potatoes, cabbages, or of any other garden vegetable. The reason of this is, that the highway is the only portion of our Northern country which is every year systematically and richly manured. Most city readers, even, are probably aware that, roads being generally slightly elevated, there runs along on each side of them a hollow or ditch into which the rains sweep most of the mud from their surface as well as the mould of the adjoining fields, the dead leaves of the trees, and a large quantity of other decaying or decayed vegetable matter. These, consequently, form on the road side deposits of soil or manure of great value for agricultural purposes, and which farmers, if they were wise, would cart away and spread over their weary fields. It accumulates, however, without disturbance during the summer, fall, and winter, and in the spring comes the road-mender and scrapes it out, sometimes with a spade, sometimes with a plow and yoke of oxen, and carefully spreads it on the middle of the highway wherever he sees a hollow place. Most intelligent foreigners who witness this process, and are not familiar with the agricultural theory of roads, are apt to imagine that it is dictated by malice or carelessness—that the farmer wants to clean his ditches out, and, to save himself trouble, dumps the contents in the road, in sheer indifference to the comforts or convenience of travellers. And nobody who was familiar with the result could honestly say that this suspicion was entirely unjustifiable, for the stuff that is thus put on never hardens. After rain it becomes a quagmire; two or three days of sun convert it into dust, which horses and wheels raise into thick clouds, rendering driving in dry weather something only to be undertaken under pressure of necessity. It is not unnatural, therefore, to ascribe the putting of it in to malignity or selfishness. Nature, if left to herself, converts a track made over most parts of the country into a tolerably good road in time. The rains wash away the loose and soft clay from the surface and bring us rapidly down to "the hard pan," which, if kept tolerably level by filling the hollows with gravel and picking out protruding stones, is perhaps as good a highway as we can have without paving or macadamizing, except in very miry districts where the subsoil itself is soft. But this our road-menders are careful not to do. They pile on the "hard pan" all the soft, glutinous, gelatinous substances to be found in the neighborhood, or, in other words, supply the materials for the two great pests of American country life—the mud and the dust. On the by-roads this nuisance is not so serious, because they are very rarely repaired, and one can accordingly often jog over them, if with a good deal of jolting, at least with eyes unbleared and lungs and nostrils unchoked. But the post-roads and great thoroughfares no trouble is spared to make impassable. Whatever ploughing and piling up soft dirt can do to make them killing to beasts and offensive to men is done with almost amusing conscientiousness. We never pass a party repairing a road in this way that we are not touched by the simple, unconscious, and unabashed air with which they dump the manure right under one's wheels.

As there are a good many very worthy people who think this the proper way to make or repair a road, we may be pardoned for stating that ever since the days of the Romans it has been an acknowledged canon of the road-making art, that the first requisite of a road is hardness. The wheels of vehicles must not sink in it. Rain must not affect it beyond making it dirty. There must not be on it anything which the sun can convert into deep dust. The Romans found out, as soon as the empire began to extend, that nothing but hard highways diverging from the capital to every corner of their dominion would suffice to bind it together. The result was the construction of those magnificent causeways, composed of large square blocks of hewn stone, crossing hill and dale, and piercing right through forest and swamp for hundreds or thousands of miles as the crow flies in every direction, and bringing home to the inhabitants of the remotest provinces, as nothing else could, the extent of the imperial power. "Far as the eye could reach," says the latest historian of the empire, "stretched these mysterious symbols of her all-attaining influence, and where the sense failed to follow the imagination came into play, and wafted the thoughts of the awe-stricken provincial to the gates of Rome and the prætorium of the venerable imperator." When she fell the roads went gradually to decay. During the Middle Ages nothing was done to repair them. Many of the great lines were totally abandoned. Forests grew over them, the soil covered them, and the return of civilization found the modern world toiling through the mud of the self-same tracks across country which Cæsar had got rid of a thousand years previously. In short, the art of road-making was lost, and was not revived till the close of the last century and the beginning of this, when good macadamized or paved roads began to make their appearance in all the countries of Western Europe, and had become general before the railroads took away the greater part of their importance.

With us, however, the smallness of the population compared to the area over which it was scattered, rendered any means of inland communication better than a cleared track through the forest out of the question. There was neither the money nor the labor to spare for anything better, and the sea and the rivers offered ample facilities for the transportation of merchandise; carriages were scarce; people performed most of their journeys on horseback, and we had hardly become conscious that our roads were bad, or rather that we had no roads, when railroads were invented. They, of course, became at once the great highways of the country, and the common roads relapsed into the apparently complete insignificance in which we now find them. That the public has not always been content with the "dirt road," however, was shown a few years ago by the number of plank roads that were constructed; but it is safe to say that but very few people who have not seen the network of roads by which continental Europe and England are covered, or those of the Central Park, in New York, have any adequate idea either of what a good road is, or what a luxury it is to those who live along it or have occasion to use it. The notions of the farmers about what constitutes a good road are revealed in the kind of thing which they dress up in spring, and call a good road—a bank of soft earth, slightly convex, and as far as contour goes sufficiently near perfection, but allowing wheels in wet weather to sink axle-deep in mud and in dry weather axle deep in dust—in other words, differing in no respect from the adjoining fields except in the absence of grass and in being smoothed off.

This horrible simplicity of ours in the matter of roads, and, in fact, in all matters connected with travelling, is rendered more remarkable by our luxuriousness in other things—hotels, for instance—and by the fact that there is no people in the world who ride in carriages so much for pleasure. We believe there are not less than twenty carriages kept in America in proportion to population, for mere recreation, for the one kept in any European country, and, if we put aside the hacks in the great cities, in the use of which Europeans, for obvious reasons, far surpass us, we believe it is safe to say that for one vehicle hired in any European country for recreation, forty are hired here; so that there is, perhaps, no country in the world in which the condition of the roads is of so much importance to so large a number of persons. Why, then, are they not better?

That their length is so great in proportion to the population, may be a sufficient answer as far as regards the West, but not as regards the Eastern States. The roads round Boston, or New York, or Philadelphia are in precisely the same condition as those of Iowa or Minnesota; that is to say, they are hard or soft, wet or dry, according to the nature of the soil over which they pass, although they lie in some of the most densely peopled districts of the western world. Nor is the great cost of macadamizing any answer either. There are no richer communities to be found anywhere than those of our Eastern States—as compared say with Ireland or Switzerland, they may be called

enormously wealthy—and yet both of these latter countries are covered with macadamized roads of the most extraordinary smoothness and hardness, always in perfect repair, and exhibiting, in the case of Switzerland, engineering triumphs of the most remarkable kind. The cost of some of the Swiss roads, such as that which has lately been completed across the Brünig Pass, or that which ascends from Valais to Loèche, must have been enormous. And yet the Irish and Swiss roads are paid for and kept in repair by a population of poor farmers by rates levied on the counties or cantons. To be sure, in the case of the Swiss, good roads are part of their stock in trade, furnishing a strong attraction to tourists; but this by no means covers the whole case. On the other hand, roads may be found in our Eastern States, running between miles on miles of villas or neat farm-houses, to the owners of which the cost of macadamizing the whole county would be a trifle, but who, nevertheless, toil through mud and dust from year to year with saintly resignation.

We are driven to the conclusion, therefore, that it is because our people do not know what good roads are that they go without them, and for this reason we look upon the roads in the Central Park as possessing a value far beyond that which lies in the convenience they afford to promenaders. They are real educators. Nobody who walks or rides over them, and sees what wear and tear they save in horseflesh, in harness, and carriages, is ever likely to be content again with the dirty lanes which the towns and villages of the country districts offer to the wayfarer, and in fact we already see macadamized roads spreading around New York.

We should hardly have dwelt on this matter at such length, important as it is in a material point of view, but for the bearing it has on that most serious problem over which so many Americans are now puzzling, of where and how to live. We are constantly deploring the growing tendency to crowd into the cities; but of all the things which contribute to make the country repulsive as a dwelling place—to make life in it dull, monotonous, gloomy, and not always healthful—the badness of the roads stands first. It makes exercise on foot impossible except in the fall. It doubles the labor of horses and makes it necessary to keep two to do the work of one; it doubles the cost of carriage repairs; it makes social visiting difficult even between near neighbors, and in fact during two-thirds of the year relegates all who cannot afford to keep large studs to their own houses and gardens. The road outside is in winter a river of mud; in summer, a pit full of dust; and it may be safely said, in fact, that children are able to be out of doors a far greater number of hours in the course of the year in the city than in the country, owing to the fact that in the former they have a paved sidewalk from October until June.

OZONE.

Something less than thirty years ago a Swiss chemist, named Schœnbein, discovered the curious fact that when a bit of phosphorus is exposed to the air, or to oxygen gas, a portion of the oxygen will be transmuted into a new and peculiarly energetic condition. In view of the pungent odor of this modified or active oxygen it was called ozone by its discoverer, from the Greek ὄζω, smell. This ozone exhibits a remarkable power of oxidizing, and so destroying, many chemical substances. Most of the vegetable coloring matters, for example, are quickly bleached upon being exposed to it; and a vast number of foul and unwholesome gases and vapors may readily be put out of existence by virtue of its oxidizing power.

Soon after the discovery of ozone, it was noticed that there is usually a small proportion of it in the atmosphere. This fact at once excited much attention and has led to much research. It is now known that the ozone, as a general rule, is particularly abundant in the open country and at sea, while in the air of large cities there is comparatively little of it at any time. It fails altogether in the air of filthy or pestilential localities, and in that of places where many persons are crowded together, as in the habitations of the poorer classes, in churches, theatres, and hospitals. Ozone can rarely be detected in the neighborhood of cesspools, or of the openings of sewers. Sometimes no trace of it can be found to the leeward of a stable or manure heap, or of a city even, at the very moment when there is an abundance of it to windward.

This deficiency of ozone in the air of crowded localities, or in that which has been in any way polluted, was at once explained by the reducing action of organic matter. It was admitted that volatile organic substances—and of these many stenches are known to be composed—upon escaping into the air must quickly be oxidized by the ozone which is normally contained in it. From this the inference was drawn not only that the atmosphere contains within itself the means of its own purification, but also that the purifying agent most immediately concerned is ozone. Experiments upon the disinfecting power of artificially prepared ozone were quickly undertaken, some of them, as those made by Scouttetten in France ten or twelve years since, of quite an elaborate character. It was then shown that air in which putrid meat had been suspended could be at once deodorized by a small quantity of ozonized air. So, too, ozone was proved capable of purifying the air of hospitals and that of apartments which had purposely been rendered particularly offensive by scattering in the rooms fermenting manure and sewer water.

The subject has latterly again been attracting a considerable degree of attention among physicians, particularly in England and in this country, and at the present moment ozone bids fair to become one of the most popular among the disinfectants, in spite of the danger from fire which attaches to some of the processes by which it is usually obtained, and notwithstanding other inconveniences which still attend its preparation by any of the methods in use.

Of all the methods of obtaining and employing ozone as a disinfectant, the old process by phosphorus appears to be still the one most frequently resorted to. Dr. Moffatt, of England, recommends the following modification of the usual process as being well suited for purifying the sick-room. Rather more than half a pint of water having been placed in a wide-mouthed quart bottle, a piece of wet cork, carrying a flat piece of phosphorus with a cleanly cut surface, is placed upon the surface of the water and left to float there. The mouth of the bottle is loosely covered, but not stopped, with a large cork or bit of wood. The bottle with its contents is then placed first in one part and then in another of the apartment to be purified, until the peculiar odor of ozone is perceptible or until its presence has been clearly indicated by test papers. The purifying process may be performed night and morning, or oftener, as may seem desirable. In order that ozone shall be formed freely by this method the temperature of the apartment in which the apparatus is placed should not be lower than 50° or 60° Fah. The exceeding inflammability of phosphorus, and the danger of having it about, even where none but judicious and experienced persons handle it, must however always be borne in mind as one very serious objection to this substance as a means of disinfection. Another easy method of forming ozone is by means of ether vapor. A few drachms of ether are poured into a large bottle, which is then shaken so that the air within it shall become pervaded with the vapor of ether; a glass rod, which has been moderately heated in the flame of a spirit-lamp, being now plunged into the atmosphere of vapor with which the bottle is filled, a quantity of ozone will immediately be formed. A correspondent of the "London Lancet," Dr. Day, has recently been experimenting upon ozone obtained in this manner. He finds that a portion of the ozone, which has been prepared in this way, will remain upon or about the bottle for a number of days, and that after the bottle has once been thus charged, as it were, it may be employed as a very convenient means of disinfection. In the instance which first attracted his attention to this persistence of the ozone, he was surprised by finding ten days after the expiration of an experiment with ozone that the bottle which had been employed was still highly ozonized, although it had been left open and freely exposed to the air. To study more closely this phenomenon, a large glass vessel was ozonized by the same process, and after a few minutes the interior of it was thoroughly rubbed with a towel. It was found that although the towel had become charged with ozone, the glass vessel still retained the power of decolorizing a solution of indigo in sulphuric acid, and of decomposing iodide of potassium, sulphuretted hydrogen, or, in other words, of exhibiting the reactions of ozone. These properties were retained by the glass and the towel for several days, and similar results were always obtained when the experiment was repeated. It was even found that ozone can be obtained by means of some samples of ether without the intervention of heat, it being merely necessary to pour a small quantity of this active ether upon cloths, which thereupon become charged with ozone. Dr. Day states his inability to determine as yet the peculiarity of these active samples of ether upon which their efficacy depends. He inclines, however, to the opinion that these samples have been long kept under conditions favorable to the absorption of oxygen, and that the process of ozonification has probably been stimulated by exposure of the ether to light. This ozone-bearing ether is, however, not readily obtainable. Out of more than thirty samples of ether which were examined by Dr. Day, only one was found which answered the purpose thoroughly, and this was known to be upwards of eight years old. Of the other samples, three or four answered tolerably well, while many gave absolutely no reaction for ozone. It had already been noticed by Schœnbein that a small quantity of pure ether left exposed to diffused daylight during four months, in a bottle which was occasionally shaken, became charged with ozone.

It is a well-known fact that oil of turpentine, a substance analogous to

ether in many respects, becomes highly charged with active oxygen after having been some time exposed to light and air. Linseed oil and oil of lemons, among other things, have been found to be capable of generating active oxygen in the same way, though to a lesser degree. Dr. Day now makes out a list of several other substances which will, under certain conditions, generate and retain the active oxygen. He has succeeded in obtaining the reactions of ozone with carbolic acid, creosote, pyroligneous acid, kerosene, naphtha, coal-tar, and chloroform. The reaction from the chloroform, however, was very feeble. Most of these substances, it will be noticed, are more or less nearly allied to oil of turpentine; and most of them, moreover, are already well known as disinfectants.

Another of the methods suggested for obtaining active oxygen for purposes of disinfection, which deserves mention in this connection, consists simply in dropping small quantities of dry permanganate of potash into oil of vitriol. The mention of this method of preparing oxygen in a condition of activity calls to mind another very closely allied to it, viz., the preparation of the so-called oxygenated water, which has been of late years highly recommended by Dr. Richardson and other physicians. In preparing this water, powdered peroxide of barium is added, little by little, to a quantity of very dilute muriatic acid, and to the clear solution which will be obtained enough sulphuric acid is added, in the diluted condition, to throw down all of the baryta. The solution thus obtained is, of course, nothing more than Thénard's well known "peroxide of hydrogen;" but just what relationship this peroxide of hydrogen bears to ozone, or to another active modification of oxygen, called antozone, or what the respective values of these several agents as disinfectants may be, are problems which still await solution.

In the same connection allusion may properly be made to a process, invented by Dr. Richardson, of applying to purposes of disinfection the apparatus for atomizing fluids, already described in THE NATION (Vol. II., No. 46). A disinfecting liquor is prepared by adding iodine to the solution of peroxide of hydrogen, just mentioned, until saturation occurs; and to this is added a quantity of a strong solution of sea-salt. Dr. Richardson's idea is that he thus prepares a liquor which may be regarded as sea-water, rendered active by being charged with free iodine and ozone. This solution, placed in one of the small hand-atomizers, can be diffused into the air in the finest state of subdivision at the rate of two fluid ounces in a quarter of an hour; but in an ordinary bed-room or sitting-room, when the liquor is diffused at half this rate, the air will so quickly become charged with ozone that test papers will be deeply colored by it in five or ten minutes. For charging the sick-room rapidly and thoroughly with active air, or, as he regards it, with sea air, Dr. Richardson maintains that this plan is the most effective yet known. The apparatus can be put in action instantly and at any moment; and in the sick-room could be used by the nurse at stated intervals, in accordance with the directions of the physician.

In employing either of these methods, or, in fact, in applying any disinfectant or any medicine, care and judgment must be exercised, lest too large a dose be administered. In itself, ozone is an irritating gas capable of exerting a very unpleasant effect upon the lining membranes of the throat and respiratory apparatus. In the sick-room, therefore, it must neither be exhibited with undue frequency nor evolved in excessive quantity.

SUMMER REST.

BY GAIL HAMILTON.

1 vol. 16mo. $2.

This volume is marked by the same characteristics that have given so wide popularity to all of the author's previous works—independence and freshness of thought, vigor of statement, and striking common sense. Its contents are as follows:

ORCHARD TALK.
A PROSE HENRIADE.
LARVA LESSONS.
FANCY FARMING.
A COUNCIL ABOUT A COUNCIL.
GILFILLAN'S SABBATH.
THE KINGDOM COMING.
KING JAMES THE FIRST.
WELL DONE.

POEMS:

BY MISS MULOCK, Author of "John Halifax," etc.

A NEW AND COMPLETE EDITION.

1 Volume, 32mo. Blue and gold. $1 50.

The thousands of American readers who have read with eager interest and admiration the story of "John Halifax," will gladly welcome this volume of poems by the same author.

WEBSTER'S UNABRIDGED DICTIONARY.

NEW ILLUSTRATED EDITION.

THOROUGHLY REVISED AND MUCH ENLARGED.

Over 3,000 Fine Engravings.

IT IS A WELL-NIGH INDISPENSABLE REQUISITE FOR EVERY INTELLIGENT FAMILY.

IT CONTAINS 10,000 WORDS AND MEANINGS NOT FOUND IN OTHER DICTIONARIES.

Its etymology presents—what it is believed is true of no other modern English Dictionary—the results of careful and thorough original investigation, Dr. Mahn, of Berlin, having devoted several years to its preparation. A work thus prepared, its foundations thus substantially laid, has obviously important advantages, in its definitions and other features, over those based upon a general collocation of former labors in this department.

"Etymological part remarkably well done. . . . We have had no English Dictionary nearly so good in this respect."—*North American Review*, Jan., 1865.

From Hon. GEORGE P. MARSH.

FLORENCE, March 7, 1866.

I have examined the new edition of Webster's Dictionary of the English Language with as much care as my leisure would permit. I am happy to say that I think it not only a great improvement upon former issues of the same work, but superior, in most respects, to any other English Dictionary known to me. The labors of the recent editors and contributors have made it undoubtedly the best general etymologicon we yet possess of the language; its vocabulary is as ample as could well be given in the compass of a single volume; its definitions are, in general, sufficiently exact and discriminating; its pronunciation is apparently conformable to the best usage; and the arrangement of the matter and the typographical execution are such as to facilitate consultation perhaps as far as is practicable where so great compression is unavoidable. Mr. Wheeler's learned and curious vocabulary, and the other appendices, and the well-chosen pictorial illustrations, are very valuable features of the work; and the extensive retrenchments, additions, and other changes of the original Dictionary appear to me, in all cases which I have noticed, substantial improvements.

It is now believed to be by far the most complete, useful, and satisfactory Dictionary of the language ever published, as it is by far the largest single volume ever issued in any language.

The possession of any other English Dictionary, or any previous edition of this, cannot compensate for the want of this very full and complete one. In its present perfected state it must long remain the BEST ENGLISH DICTIONARY, and, once possessed, remain of constant and abiding value.

What book, beside the Bible, so indispensable as a good Dictionary?

In one volume of 1,840 royal quarto pages.

FINANCIAL REVIEW.

NATION OFFICE, Monday, June 11, 1866.

WE have dates from London to June 1. The financial situation in that city had but slightly improved, though three cargoes of bullion from this side had reached the Bank. The week's statement only showed an increase of £21,000, which implies that our gold was shipped to the Continent as fast as it was received. The most important changes reported by the recent arrivals are an advance of 1d. to 1½d. in cotton, and an advance of 2 to 3 per cent. in Erie, Illinois Central and 5-20 bonds. So far as the advance in our stocks is concerned, that was doubtless due to purchases for export to this country. They will net the buyers a loss, as the advance in gold on this side from 130 to 140 more than counterbalances the fall in the stocks in London. Among other securities which have fallen heavily in the panic we notice Atlantic and Great Western bonds, which have gone to 48, partly in consequence of the failure of the Consolidated Bank, through which institution they had been in part negotiated. It is appalling to reflect what the consequences might have been in London had we not been in a position to come to the assistance of our English friends with large remittances of coin.

The situation here is unaltered. Money is easy at six per cent., and some of the banks would like to lend for long periods at that rate. So abundant is the volume of currency that the westward drain, which usually affects our market at this season, is not felt at all. The importations at the port, for the first time in many months, were last week less than $2,750,000; the export of produce $1,634,555, and of specie $4,220,456. In five weeks we have shipped to Europe thirty millions of gold.

Gold fell on Friday to 138⅝, but since rallied to 140¼. To day, after selling at 137½ at 3 P.M., it stands at 139¼. The market is in a condition which tempts speculators to venture upon a corner, and operations of the kind must be expected. Nothing can now deprive speculators of the control of the market, except heavy receipts of cotton, which cannot in any event be expected before October. Exchange has been in fair demand at 110 for bankers' 60 day bills and 111 to 111¼ for short sight. Mercantile bills are scrutinized with great care.

The stock market presents no new feature. Operators in Erie have succeeded in making the stock scarce, and 1-16 to ⅛ of 1 per cent. was paid on Tuesday and Saturday for its use for delivery. As there must be somewhere or other in Wall Street about 110,000 shares of Erie, the pinch can hardly last very long. New York Central, of which Wall Street must hold 200,000 shares, was kept scarce for a couple of days by the clique, and then relaxed. How much stock they contrived to sell during the pinch is not known, though it cannot have been much. The price has since fallen two per cent. Pittsburgh has declined 3 per cent. on further efforts by the clique to unload. Michigan Southern, Fort Wayne, and Rock Island keep pretty steady. The silly movement in Boston Water Power appears to have exhausted itself. Wall Street is getting too wary to be caught by such transparent tricks. Something more than the mere pushing up the price of a stock by persistent clique-buying is now required to tempt the public to purchase.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	June 4.	June 7.	June 11.	Advance.	Decline.
United States Sixes of 1881	105¾ex.int	105¾	105¾	....	....

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

WEED SEWING-MACHINE CO.,
STORE, 506 BROADWAY, N. Y.

THE NATION

Was, when started, essentially an experiment. Journals of a similar character had been tried and had succeeded in Europe, but the idea that there was enough interest felt here in literature or in art to support a paper mainly devoted to the discussion of literary and art topics, or that there existed what economists call an effective demand for any more careful or more general discussion of political news than writers of the daily press working between dusk and dawn were able to supply, was scouted by many. Our experience, so far as it has gone, satisfies us that it is this want of faith rather than want of appreciation which is the greatest difficulty which any such journal has to contend with here. Thousands enjoy it for the one who believes that his neighbors will enjoy it, and, of course, any very widespread doubt of its success increases the difficulty of succeeding.

TERMS—$5 per annum; 6 months, $3.

When delivered by Carriers in New York or Brooklyn, $1 additional.

JOSEPH H. RICHARDS, Publisher,
130 Nassau St., N. Y.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not detracting in the slightest degree from its many positive advantages, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fulness, prolongation, and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

Topics of the Day.

THE reconstruction resolutions, as amended by the Senate, have passed the House, Mr. Stevens concurring, in a speech dashed with melancholy foreboding, and which, considering the physical condition of the speaker, it is impossible to read without emotion. But Mr. Stevens seems to have only now learned certain lessons which most men have acquired before they reach middle life. He gives as one of his reasons for acquiescing in the present resolutions that he has found "that he lives amongst men and not amongst angels; men as intelligent, as determined, and as independent as himself, who, not agreeing with him, do not choose to yield their opinions to his." It really makes one sad to think of the enormous amount of labor which reformers waste owing to their forgetfulness of this little fact. The division of one's fellow-citizens into angels and devils is a most inconvenient one, for political purposes at least, and anybody who insists all his life upon considering this classification as final is pretty sure to have, like Mr. Stevens, to mourn at the close over many withered hopes. Nobody but an angel or the Pope is entitled to treat difference of opinion, either in politics or religion, as necessarily proof of moral depravity. Mr. Stevens has fought a good fight in his day and has earned the right to be disappointed; but there is in all such expressions of despondency as his a trace of distrust of Providence. God does not wholly commit the work of regenerating the human race either to anti-slavery associations or Congressional majorities, and we may be sure witnesses their failures and disappointments with perfect equanimity, and without the smallest wavering of purpose.

THERE being indications in various quarters of a desire to have Jefferson Davis liberated on bail, and possibly relieved even from the formality of a trial, Mr. Boutwell, on the 11th inst., moved that it was the opinion of the House that he should be held in custody and tried by the laws of the land. We still feel satisfied that the trial, if it ever comes off, will be a farce, and that, so far from helping to "make treason odious," it will surround the very existence of such a crime with a fog, and we believe that one great object of the long postponement of the trial was to give time for the growth of such an indifference in the public mind as would render this result possible.

IF the Fenians in council of war lost their reputation for secretiveness, they are winning it back again in the more accustomed field of the court of justice. Military secrets they shrewdly published to all the world; in the witness-box, where they go to tell the truth and the whole truth, they shut their mouths and tell nothing. Lover or Griffin should be alive to depict Commissioner Betts's court-room. Of course, Mr. John McKeon sees British gold and the emissaries of England buying up judges and juries in order that his clients may be crushed; the Fenian witness, to the delight of his friends, bothers completely the prosecuting attorney; the black Orangeman, the faction-fighter in every word he speaks, is a swift witness against "this Fenianism," which he considers a bloody revival of popery, whereupon the audience cries "Oh! oh! it is, is it?" and hisses and execrates, while the commissioner threatens that the room shall be cleared unless order is maintained, and by and by the sheriff has to clear it. The movement is dead. Mr. Ancona, aided, to everybody's surprise, by a majority of the House, galvanized it into an appearance of life the other day, and, as the sole result of this action, we shall probably have a report on the neutrality laws, and English and American observance of them, from the Committee on Foreign Affairs. "President" Roberts has been set at liberty, having decided to give his parole to appear when wanted, and has put forth a proclamation which he dates from Ludlow-Street jail—a dungeon in which he stayed just long enough to rattle his fetters, speaking in a figure, and jump furiously the length of his chain by way of showing his ineradicable hatred of the British lion. It is most improbable, we suppose, that any more armed expeditions will leave our territory for Canada. The summary execution of the misguided Fenian prisoners by the Provincial authorities would do more to light the flame again than anything else which is likely to happen.

THE ship carpenters of this city have succumbed in the strike which they have maintained since the 2d of April for an eight-hour rule of labor. They have, of course, inflicted a heavy loss on their employers, but only at the expense of their own resources, while the object of their combined action has been utterly defeated. They not only had no claim on the public sympathy—being unable to present a solid grievance—but they have alienated that sympathy from the eight-hour movement as a whole, which has been proved in their case guilty of mismanagement or lack of principle, or both, and to have made scarcely any advance in its modes of obtaining success over the ordinary coercive trade organizations.

WOMEN'S right to wear men's clothes has been tried this week before the Metropolitan Police Commissioners in the case of Dr. Mary E. Walker, and decided, as far as the police are concerned, in the lady's favor. It is, nevertheless, we believe, a misdemeanor for women to dress like men, but if the police refuse to execute the law, of course it becomes a dead letter. Dr. Walker justified her course by alleging the present style of female dress to be productive of immorality—one of those propositions whose value lies mainly in the impossibility either of proving or disproving them; but something very like it is constantly heard in political discussions.

THE President has in his work of pardoning at last reached the rebel privateersmen, one of whom, Lewis M. Coxsetta, of South Carolina, was purified from his guilt in this way last week. Semmes is still kept waiting, but we have no doubt his character is strengthened by

the delay, and that whenever the pardon does come it will convert him into an unusually valuable citizen, before whom Stevens and Sumner will have to hang their heads.

Some apprehension was entertained that a mass meeting of Staten Islanders on Tuesday last would result in an attack upon the policemen at Seguin's Point. It passed off quietly, however, though there were one or two "Peaceably if we can, forcibly if we must" placards, and the memory of nine years ago was recalled. The speakers generally advised the audience to respect the constituted authorities, and declared their belief that the Board of Health officers could be ousted, by legal means, from the territory seized; at any rate, Staten Island could keep the affair in mind when members were to be chosen for the next Legislature. It is to this remedy, if it shall prove one, that the islanders will probably be driven; for the reports in circulation about an injunction having been laid upon the Board by Judge Barnard seem to have been incorrect, and the opinion of lawyers appears to be rather in favor of the seizure than against it.

The Committee on Foreign Affairs have recommended certain appropriations for the payment of the expenses attendant on our participation in the Exhibition of 1867 which the public creditors may hear of without trepidation. Forty-eight thousand dollars in coin is set apart for furniture and fixtures, which may or may not be enough—all will depend on the nature and size of the fixtures; but the compensation prescribed for the "principal agent of the exhibition," a man on whom the success of our appearance in it will largely depend, and whose accomplishments ought to be vast and varied, must have been fixed in a moment of wild extravagance. It is neither more nor less than two thousand dollars per annum. The cost of living in Paris is now as great or greater than that of living in New York, so that the fortunate "principal agent," if he has a family, will have to issue "bonds," like the Fenian republic, in order to secure the means of paying for his board and lodging. If a single man, he may be able to maintain himself upon it in tolerable health, by dining at the cheap restaurants in the Palais Royal and cutting down his allowance of shirts, but, as we are all interested in his presenting a clean and tidy appearance, we respectfully urge upon Congress the propriety of offering to provide for his washing bills as an "extra." The "ten professional and scientific commissioners" who are to be appointed by the President are to have one thousand dollars each for their travelling expenses. It will cost them five hundred dollars each to cross the Atlantic and return, so that they will have as much more to cover any liabilities they may contract in Paris. We hope they will be careful of their money, avoid auctions, bric-a-brac shops, and crack restaurants, and keep early hours.

The acceptance of the proposed conference at Paris on the part of the Powers which are likely soonest to become belligerent, has been attended with a good deal of reservation, explicit and mental. It seems destined to be a meeting at which everything that needs to be settled will be objected to as not in order for discussion, and which will dissolve at the first gun-shot beyond the Alps. Its failure will be Napoleon's revenge on Europe for its refusal to assemble at his call during the late Polish insurrection. The date fixed for the present conference, the 18th of June, is not without significance as that of the battle of Waterloo. It may be an ugly reminder of the day which begot the "odious" treaties of 1815.

The reform bill is in such a bad way in England, and its defeat is now considered so certain, that the enemies of the ministry are loudly calling on it to resign, and its friends to dissolve Parliament. The last check it received came in the shape of a defeat by a majority of *ten* on a motion to introduce a provision into the bill for the punishment of bribery and corruption. It is still uncertain which course Mr. Gladstone will pursue. Mr. Lowe is gradually becoming the champion of the Tory party, and is the ablest debater it has had for many a day, besides being the least scrupulous and most cynical.

CONGRESS.

Washington, June 13, 1866.

The fact frequently demonstrated, that the House of Representatives is more sedulous of manifesting its sympathy with the cause of popular freedom all over the globe than careful of diplomatic prudence, was manifested in the votes on the Fenian business on Monday. Almost unanimously refusing to table a resolution of sympathy, which went so far as to instruct the Committee on Foreign Affairs to bring in a bill repealing the neutrality act of 1818, under which the President's late proclamation was issued, the House then consented to refer the subject to that committee, upon the express assurance of Mr. Banks, its chairman, that they would report upon it. This bodes little regard for Great Britain on the part of the immediate representatives of the people.

As I write, the House has passed, after only three hours' debate, by vote of 120 yeas to 38 nays, the joint resolution submitting to the States certain amendments of the Constitution, as it came from the Senate. The vote was not full, from the absence of over thirty members on sick leave, etc., but the relative majority of the Radicals is increased by two or three unexpected votes from the border States. It stands now at over three-fourths of the whole House reliably certain upon most issues. There is much gratulation among members at the net result of the session thus far.

DIARY.

Monday, June 11.—In the Senate, the House bill requiring all disbursing officers of the United States to deposit moneys only with the Treasurer or Assistant-Treasurers of the United States, was passed. The day was spent in considering the Steamboat Inspection bill and the bill securing land titles in California.

In the House, Mr. Ancona offered a resolution looking toward a repeal of the neutrality law of 1818, and expressing sympathy with the purpose of the Fenian movement. The House refused to lay the resolution on the table—yeas, 5; nays, 112. The House then referred the resolution to the Committee on Foreign Affairs—yeas, 87; nays, 35. The Senate resolution appropriating $120,000 to enable the President to conclude treaties with certain Indian tribes was passed. Mr. Boutwell offered a resolution that it is the opinion of the House that Jefferson Davis should be held in custody as a prisoner, and subjected to a trial for treason. Adopted—yeas, 105; nays, 19. Messrs. Rousseau and Price made speeches upon reconstruction.

June 12.—In the Senate, House bill making appropriations for certain rivers and harbors was passed. Also passed, House bill further to provide for safety of passengers' lives on board steamboats. The report of a committee of conference on the disagreeing votes of the two Houses on appointments to West Point Military Academy, was agreed to. The report retains the feature requiring a selection to be made of one in five of the most meritorious candidates recommended by Congressmen and by the President for cadetship.

In the House, the report of conference committee on West Point appointments was agreed to. The rest of the day was consumed on District of Columbia matters and private bills.

THE FREEDMEN.

Gens. Steedman and Fullerton have made their second report to the Secretary of War, from Augusta, dated June 4. They begin by imputing maladministration to Gen. Saxton because his successor, Gen. Scott, has "greatly reduced the issue of rations to freedmen." The charge of extravagance is opportunely made public at the very moment when we are officially told that "reports of great destitution are coming in from South Carolina, and Gen. Scott, the assistant commissioner, has asked for authority to issue an *increased* number of rations;" and while famine is imminent in Alabama. The outrages of the outlaws in Edgefield County, S. C., are coolly laid at the door of the Bureau, on the testimony of "intelligent and influential citizens," when nothing is more notorious than the fact that the forces at the command of the Bureau have been so diminished everywhere that it could and can hardly enforce its proper authority, let alone hunting down well-mounted bands of marauders from the late rebel army. Such attempts as these to justify the President's hostility to the Bureau are too clumsy to excite apprehension in the minds of its friends.

—At the recent session of the South Carolina Conference of the African M. E. Church the temperance committee made a report deprecating the use of tobacco. The report was amended so as to pledge the members of the conference to abstain from tobacco *by the next session* of the annual conference.

Notes.

LITERARY.

In the report of the French Minister upon the Universal Exhibition to be held in Paris next summer there occurs a sentence which is worth some thought: "International exhibitions promise to become perfect representations of modern society in its various forms of activity." As a help to render them perfect representations, the French Government proposed to publish historical reports setting forth the progress of the nation for the last twenty years in literature, science, art, education, and material prosperity, and requested other nations to do the same. In order to illustrate the activity of English civilization, the Committee of Council on Education have determined to exhibit a complete collection of English periodical literature of the day, containing one specimen of every newspaper, review, literary, artistic, or scientific journal, magazine, tract, pamphlet, play, street-ballad, or the like, published in Great Britain or the Colonies during the year 1866. Mr. Charles Collins, of the South Kensington Museum, is entrusted with the arrangement of the collection. The task which Mr. Collins has undertaken is enormous and one of vast labor. Such exhibitions are very useful, and, if they are to be held periodically, will be of great interest to students of social science, as showing the relative improvement in the taste of the lower classes. We are not aware that any one has undertaken to write any records of the progress of the United States for the Paris Exhibition, though it would have been a task fully worth while, as showing to our neighbors what this country has really accomplished, and as giving to ourselves a true statement of what we had done, which might act as a useful check on indiscriminate self-laudation. At all events, a collection of the kind contemplated by the English Government can be easily made here. It would be extremely interesting and useful to ascertain from inspecting such a collection the average culture of the American mind, as displayed in the quality of the literature. Here we are emphatically a reading public, and almost every town of moderate size possesses one or more newspapers. It would be a curious enquiry whether the quality of our reading-matter is above or below that of England for similar classes of persons. It would be well to accompany each newspaper and journal with the number of its subscribers, and if possible the extent of country over which it is circulated. Cannot some of our education societies, or the Smithsonian Institute, to which such a task especially belongs, take the matter in hand at once, and secure an adequate representation of the literary activity of this country?

—On Saturday, May 21, died at Paris Francis Mahony, well known to all as "Father Prout," the witty contributor to "Bentley's Miscellany" and "Fraser's Magazine." Mr. Mahony was born at Cork, in 1805, but left Ireland early and was educated at Jesuit schools in France and Rome. He took priest's orders, but the life was not to his taste, and, after having been expelled from the order of Jesuits, he turned himself to the profession of literature. With Dr. Maginn and Sergeant Murphy, both Cork men, he made a trio that were the raciest contributors that "Fraser's" ever had. He was familiar with many languages, and wrote Greek and Latin verse with great facility. He often used to impose on his friends by fictitious classical quotations, and was famed for making Latin originals, credited to some poet of the Middle Ages, for modern poems, whose authors he would then accuse of plagiarism. His translations into Greek of "The Groves of Blarney," "The Night before Larry was Stretched," and some of "Moore's Irish Melodies," showed much humor. The "Prout Papers" were collected and published by Fraser in 1836. After being long out of print, they were republished, in 1860, in "Bohn's Illustrated Library," with etchings by Maclise. The last years of his life he spent in Paris, where he was correspondent for several London newspapers. He was always orthodox, and his abilities were highly esteemed by the authorities of the Church. It is stated on good authority, and is confirmed by Father Mahony's own assertions, that he was at one time offered a cardinal's hat, on condition that he should devote himself entirely to the interests of the Church. The bargain was agreed to, but afterwards fell through when it became known that he had his own peculiar opinions as to the use of liquor allowed a church dignitary.

—The election at the French Institute to fill the chair of M. Clapisson resulted in the choice of M. Gounod, the composer of "Faust." His competitors were Félicien David, who received sixteen votes, and Victor Massé, who had only one. M. Gounod himself obtained nineteen. The musical section of the Académie des Beaux Arts now consists of MM. Auber, Carafa, Ambroise Thomas, Reber, Berlioz, and Gounod. M. Gounod was born in 1818, and studied music with Lesueur and Halévy. He remained in Italy after completing his studies, until 1843, and did not begin writing for the stage until 1850.

—In addition to the books of Shakespeare mentioned in the last number of The Nation, we have to record the publication of the two concluding volumes of François Hugo's French translation with the title of "Les Apocryphes," containing "Titus Andronicus," "A Yorkshire Tragedy," "Two Noble Parents," "Pericles," "Edward III.," and "Arden of Feversham." An entirely new French translation by Emile Montégut is about to appear in two hundred parts, illustrated, at fifty centimes each. The first volume of a Hindostani translation has also been published at Bombay.

—There are in Italy 210 public libraries, containing in the aggregate 4,149,281 volumes. Besides these there are the libraries of the two Chambers, of the Council of State, and many easily accessible large private collections. There are also 110 provincial libraries and those of 71 scientific societies. In 1863, which is the last year for which we have statistics, 988,510 volumes were called for by readers, of which 183,528 related to mathematics and the natural sciences; 122,496 to literature, history, and philology; 54,491 to theology; 70,537 to philosophy and morals; 193,972 to jurisprudence; 261,869 to the fine arts; and 101,797 to other subjects.

—The *Pall Mall Gazette* states that Gen. Lyon, late of the Confederate army, has discovered another lost city in Mexico, in the district called by the Indians Metaltaloyuca, situated about one hundred miles west of Tuxpan, in the State of Vera Cruz. Trees, hundreds of years old, are growing among the ruins. The walls of many houses are standing, and on them are paintings and other ornaments, and carved doorways and images abound. Several temples were found, and in one a statuette, on the reverse of which was a cross. The doors of the houses were generally closed with blocks of stone, and there were other indications that the city had been abandoned by a preconcerted movement.

—A remarkable discovery has lately been made by Mr. Parker, one of the founders of the British Archæological Association at Rome. He was groping about the river side opposite to the Cloaca Maxima, with his photographer, endeavoring to get a good view of the mouth of the Cloaca, when he nearly ran against three large stone corbels projecting from the wall in the face of the cliff. They had holes in them, evidently for the purpose of receiving large chains, and their facings are carved in the form of lion's heads of Etruscan character. Mr. Parker thinks they were made in the time of Camillus, after the taking of Veii, and were removed at a later date, and probably replaced by Sylla, who constructed extensive works on the Tiber. His reason for this supposition is that the heads are fastened in with cement, and cement was not used before the time of Sylla. The heads are not quite alike, and one seems of much later date than the others. It is probable that there were similar corbels on the other side to support the other ends of the chains, but this place is occupied by the foundation of a mediæval house. All are just above the remains of the Pons Sublicius.

—A curious account of the great Ti-ping rebellion in China has just been published in England: "Tiping Tien-Kwoh; the History of the Tiping Revolution. By Lin-Le." Lin-Le is apparently a Chinese version of Linley, the writer being a European who served as an officer under the Ti-ping chief. The book contains the story of the writer's personal adventures in the war, with accounts of all the chiefs of the rebellion, and of their objects, derived from personal intercourse with them, as well as a summary of the doctrines and belief of the Ti-pings. The story is very interesting, and told with straightforwardness and simplicity, though, as to many particulars, the reader cannot help being a little incredulous. Lin-Le appears to look upon the Ti-pings as highly civilized Christians, who observe the laws of Christian marriage, have family prayers, baptism, Christian burial, a strict observance of the Sabbath, and a freedom from barbarous vices. The religion which they professed, however, resembled Christianity as Mohammedanism does Judaism. Hung-shui-tshuen, its chief founder, professed to have gone to Heaven, and there to have received certain revelations which are described in the strange book called the "Trimetral Classic." One of its verses says that the Deity

> "Bade him (Hung-shui-tshuen), together with the elder brother,
> Namely, Jesus,
> To drive away impish fiends,
> With the co-operation of angels."

The "impish fiends" is the complimentary description of the Imperialist soldiers.

—Trübner's "American and Oriental Literary Record" has reached its fourteenth number. Its success has shown that it has met the wants of

many literary men, in bringing to their eyes some account of the hitherto unrecorded current literature of the world. It is cosmopolitan in aim, including lists of the recent publications in China and India, as well as in Brazil and the United States. It has, also, bibliographies of special subjects, as of Hindu law, of Zoroastrian literature, and of English parliamentary papers. The last number contains a catalogue of the literature of the Argentine Republic, lists of Cuban, Armenian, and modern Greek books, as well as of Sanskrit, Gujarati, Marathi, Bengoli, and Hindi literature.

SCIENTIFIC.

Evidence of a Former Cold Climate in Europe.—Oscar Schmidt has found in the neighborhood of Gratz, the capital of Styria, two hundred feet above the Mur, the ancient dwellings of the marmot, with the skeletons of four individuals. As the marmots inhabit only the regions bordering on the snow-line, this discovery leads back to the diluvial or drift period, when, by the extension of the glaciers, the upper Alpine animals and plants were kept down in lower levels than now, evidences of which have hitherto been found almost exclusively in Switzerland.

Among recent discoveries indicating the co-existence of man with animals now extinct, that of the musk-ox in France, by M. Lartet, is important. At the present time, this animal is only found in the arctic regions, does not descend below sixty degrees of north latitude and ranges as high as seventy-five. The remains just referred to show that they existed at least fifteen degrees further south. Since their habitat is strictly arctic, their presence in France would seem to indicate a climate much colder formerly than now. Another discovery of far greater interest and significance comes to the support of this view. In 1864, M. Lartet, in company with the late Dr. Falconer, the eminent English naturalist, and Mr. Christy, visited the department of Dordogne, in the southwest of France, where there had been previously discovered pieces of the antlers of the deer with figures of animals rudely engraved upon them. During the stay of the naturalists just mentioned there was found a broken plate of ivory evidently formed from the tusks of a large elephant. When the fragments were fitted together, Dr. Falconer noticed that there was engraved upon the plate the figure of an elephant, the most remarkable feature of which was the indication that the animal was provided with long hair. No such elephant exists at the present time; but, as is well known, the celebrated mammoth, discovered in 1799 by Mr. Adams, imbedded in the ice near the mouth of the Lena, in Siberia, was provided with long coarse hair, portions of which may be seen in the museums of St. Petersburg and of the Garden of Plants, in Paris. The discovery of the engraved ivory at Dordogne, while alone it cannot be admitted as positive proof, yet, in connection with other observations, clearly points to the existence of the mammoth in France, and as a contemporary with man. For in the rude stone age to which the ivory must be referred, it is difficult to conceive of man's having any other knowledge of the outward characters of animals than that which comes of personal observation.

In this connection it may be stated that the welcome news has been received and communicated in a letter from C. E. de Baer, of St. Petersburg, to the Academy of Sciences, in Paris, that another frozen mammoth has been found. It was first observed by a Samoeide in the neighborhood of the Bay of Taz, on the eastern arm of the Gulf of Obi. The Academy of Sciences in St. Petersburg has commissioned a distinguished naturalist, M. Schmidt, to make as complete a study as possible of these interesting remains and of all the circumstances connected with their burial in the frozen earth where they now lie.

Development of the Eggs of Fishes.—The conditions under which the eggs of fishes are developed, and the young come to maturity, are much more varied than is generally supposed. While the greater portion scatter their eggs broadcast, and no longer care for them after they are laid, some are truly viviparous, and others deposit them in carefully made nests, where one or the other of the parents watches over them until they are hatched; such is the case with the common "bream," the "hassars" of Demerara, the small catfish or "horned-pout," the "stickle-backs," so well known in our aquariums, and several other species. The "pouts" are followed by their young as a hen is followed by her chickens. With the "stickle-backs" the care of the nest, and, for a time, of the young, too, falls to the lot of the male, for here, as with some other species, the female has the strange propensity to eat her own eggs as soon as laid. Against this curious habit he acts as protector, and in the performance of this duty his fighting qualities are often called out. In a few species the eggs are carried in some way about the outside of the body of one of the parents. In the "trompetti" of Guiana they are attached to the under side of the abdomen and forward fins and even of the head, each egg being supported by a slender thread with a cup on the end of it; these threads grow anew with each successive brood of eggs and disappear from absorption soon after the eggs are hatched. The "pipe-fishes," or "sea-horses," are true marsupials, a pouch being formed on the under side of the body; this is strictly analogous to the pouch of the kangaroo and opossum. It is the prerogative of the male to be the bearer of this pouch, and to carry the eggs until they are hatched; and even after this, for a time, the young go out from it and return again for shelter, just as do the young opossums from that of their mother. Among some of the siluroids, or "catfishes," there is a still more remarkable mode of gestation, in which the eggs during the whole period of their incubation, and the young for a long time after, are carried in the mouth. In Guiana the kinds commonly sold in the market and known by the names given them by the negroes, with whom they are favorite articles of food, as "javra-bakkas" and "ujinge-ujinges," during the breeding season, are offered for sale with their mouths literally crammed with eggs or young; the former in every stage of development, and the latter in different stages of growth after having acquired their mature shape.

Prof. Agassiz, in a letter to M. Milne Edwards, printed in the "Annales des Sciences Naturelles" for April, records the discovery of additional species having this singular mode of gestation. During a month passed at Teffé, on the Amazon, devoted to embryological studies, he ascertained that many species of different genera of chromids carry their eggs at the back part of their mouth, in a pouch connected with the upper pharyngeal or throat-bones, also in a cavity in front of the first gill-arch. He also observed, what had not been known before, that some species of the loricarias carry their eggs attached to the broad membranes which surround their mouths, and hang from their lips. Finally, he has discovered that other species, as the hypostomes, sit upon their eggs after the manner of birds. This is probably only for the purpose of protection, since the temperature of their bodies is not known to rise above that of the water.

Flight of the Flying Fish.—Mr. Horace Mann, in the proceedings of the Boston Society of Natural History, has brought forward additional evidence in relation to the manner in which the flight of these fishes is sustained. The so-called flight has been asserted by some naturalists to be only a long leap, the fish projecting itself from the water by a vigorous action of the tail, just as the salmon does in ascending falls, the large fins acting as a parachute, but never as wings after the manner of birds. A few observers have claimed that they really flew. Mr. Mann's observations sustain this last view, as appears from the following facts. These fishes leave the water at a very low angle, of only five or six degrees, and during their flight change their direction so as to rise over the crests and descend into the hollows of the waves. The motion of the fins was distinctly seen under favorable circumstances, as when they flew near the ship and the sun-light struck upon them so as to be reflected to the eye. The motion is not constant but somewhat intermittent, though kept up during the whole flight. The extent of their vibrations is quite small and is indicated by a more or less shady space, or glimmering, which corresponds with the arc through which they move. In some instances they flew to the distance of seventy-five or a hundred yards, barely touching the water, from time to time, and at others thirty or forty yards without touching it at all.

A Point in Cookery.—No one but a German could have had the patience to invent the following "process of quickly (!) cooking soft and rendering easily digestible dried peas." The dried peas are covered with cold water and left to soak during twelve or fifteen hours; the water is then poured off, and the moist, swollen peas are placed in a covered vessel, which is set in a tolerably warm place and left there during forty-eight hours. Under this treatment the peas begin to germinate, they become rather soft, and a certain amount of sugar is produced within them. On now cooking the peas, says the chronicler, they will be quickly done, and will be found to have an agreeable taste, to be easily digestible, and to exhibit almost precisely the same characters as fresh green peas.

BEETHOVEN'S LETTERS.*

To his interesting collection of the letters of Mozart, Dr. Nohl has now added another of the letters of Beethoven, by no means, however, so interesting; for they not only add very little to what we know of Beethoven from the life of him by Schindler, but are in themselves for the most part merely

* "Beethoven's Letters (1790-1826). From the Collection of Dr. Ludwig Nohl. Also his Letters to the Archduke Rudolph, Cardinal-Archbishop of Olmutz, K. W., from the Collection of Dr. Ludwig Ritter von Köchel. Translated by Lady Wallace. With a Portrait and Fac-simile. In two volumes." London: Longmans, Green & Co. 1866.

tedious details of business or pitiable exhibitions of temper. And for one so much given to writing as Beethoven was, it is rather surprising indeed that letters of a more attractive sort have not been found, especially as Dr. Nohl conjectures that twice as many as he has been able, after infinite labor, to present in this collection may exist scattered over Europe. Yet, meagre as the work is, it will not fail to find many readers; for it introduces us once more to the presence of the great master, whose personality it is so necessary to comprehend in all its originality in order fully to understand his works.

Of Beethoven, the man, therefore, we propose now to say a word as explanatory of his letters, as, indeed, the best criticism upon them; for, unlike the letters of Mozart, or the still more charming letters of Mendelssohn, they do not in themselves present his whole character. The strange, weird outlines they suggest must be filled up from other sources.

Born in Bonn, in 1771, the life of Beethoven was contemporaneous with that great intellectual development in Germany which has made it such a power in the present century. While Herder and Lessing and Goethe breathed a new spirit into criticism and philosophy, Glück and Bach and Mozart and Händel led the way to that eminence in music which Germany has ever since maintained; and Beethoven carried on the work they began. Like a being who has descended from an ideal world to redeem this, he was in perpetual struggle with the past; and his early days in Bonn, before he had attained a full consciousness of his task in life, were his only happy ones. They were to him, as has been so well said, what the sweetly fanciful larghetto of his second symphony has been to the world, an undisturbed because unconscious happiness. His father and grandfather were musicians before him, and he showed early great musical genius. At the age of fifteen he was made organist of the court chapel at Bonn, and at the age of twenty-two went to Vienna to study under Haydn. Mozart had died a year before, and it was only once, on a flying tour to Vienna in the winter of 1786–7, that Beethoven met him; and how Mozart recognized his genius is illustrated by a curious anecdote. Beethoven had acquired much reputation for his improvisations upon the piano, an exercise in the genuineness of which Mozart had no real belief, fancying that the pieces to be played were secretly agreed upon beforehand. He resolved, therefore, to test Beethoven, and gave him as a subject a chromatic figure, the motive of which contained the opposite subject of a double figure. Beethoven instantly detected the deception, and, reversing the motive, improvised a regular double figure; and the lively Mozart slipped away into an adjoining room to say to those he found there that here was a youth the world would hear of.

The placid mind of Haydn, however, could less understand the soaring genius of Beethoven, and they soon separated. The immediate cause of the rupture, indeed, is said to have been the fact, which Beethoven one day accidentally discovered, that Haydn neglected to correct his errors. That was, in Beethoven's eyes, a *crimen læsæ artis*, and he broke from him at once; and when, notwithstanding, it was suggested to him afterwards, at Haydn's instance, that in the compositions which he was publishing he should call himself Haydn's pupil, his proud, curt reply was that he had indeed taken lessons of Haydn, but had learned nothing from him. And that answer is the key to the history of his subsequent career, with its ceaseless effort to ascend up out of the present and out of the past to dwell in newer regions and among sublimer thoughts.

Shortly afterwards, the Prince Lichnowski took him into his palace, and the princess watched over him with the care of a mother; his whims, and they were many, were consulted; he enjoyed the best society, and he had fully, as yet, his sense of hearing. There was nothing to disturb his repose, as it finds expression in his first and second symphonies, in his first six quartettes, in the septette and first twelve piano sonatas. But beneath this apparent calm there was a turbulent, restless spirit at work in him, which drove him presently out into the dreary world to battle with its routine and to vivify it anew. Kind as his patrons had been, he felt it better to hunger and be misunderstood than not to be himself, supreme in his own sphere. And he gained what he sought, but he gained it with that strain of discord in his finer nature which is to the soul of the artist what the shadow of a cloud is to a landscape. The desire not to improve, but to recreate the world, to make it different from what it was in kind as well as degree, was the error which ruined his earthly peace; for he persisted in judging all relations of life by the unattainable ideals which drew him on in music. Yet it was out of this opposition to the reality, out of this dualism of his life, which was to him a sorrow and bitterness known to but few beside him, that there came, after long struggle, the final victory of his later creations.

It is not, however, to his compositions that we wish now to advert, but to that moral superiority which, in spite of his infirmities of temper and his eccentric habits, marks the career of Beethoven from the first day we have any knowledge of him to the last. For to appreciate these letters, sterile as most of them are, one must understand the real elevation and the unquestioned purity of Beethoven's life. In the midst of a corrupt city and a still more corrupt court, in an age of license, exposed to all the seductions which beset genius of an order like his, he preserved ever a lofty virtue and a hatred of whatever was impure or even equivocal. Thrown, as he was, into every-day contact with the proudest and richest nobility in Europe, rank and wealth remained to him ever matters of absolute indifference, mere accidents of this temporal material life. Hence, in his political sentiments he was practically a republican. A devout reader of Plato, he longed to see all institutions modelled upon the plan prescribed in the "Republic." "Plato's Republic," says Schindler, "was transfused into his flesh and blood." It was his firm belief that it was Napoleon's real intention to republicanize France upon similar principles; and it was not till the news came that Napoleon had caused himself to be proclaimed Emperor of the French that he was undeceived; when, tearing off the title-page of his "Sinfonia Eroica," containing the dedication of that work to Napoleon, which he was just on the point of despatching to Paris, he flung it upon the floor with a torrent of execrations. The tragic end of the great conqueror, however, is said to have reconciled Beethoven to him, for, as he remarked, he had predicted it himself in the "Dead March" of this symphony.

At Töplitz, in 1812, he was walking one day with Goethe, when they saw at a distance the whole Imperial family approaching. With his usual stately deference, Goethe stepped aside and stood with his hat off, bending low, until they had passed him. Beethoven, on the contrary, pressed his hat yet more firmly on his head, and walked, with folded arms, through the thickest of the throng. Princes and pages made a path for him, the Archduke Rudolph took off his hat, and the Empress bowed. There may be a difference of opinion upon the question of manners, but there can be none as to the honesty of Beethoven's convictions. It was Goethe's remembrance, it may be, of this uncourtly freedom that led him to take no notice of Beethoven's letter, eleven years afterwards, soliciting a favor which he could easily have granted to the poor composer wasting away under the burden of his task. To be sure, as Mr. Lewes says, there is no evidence that Goethe received the letter, but also none that he did not receive it, and posterity will no doubt dwell a good deal on the latter fact.

But the worst trials of Beethoven's life, it must be confessed, were chiefly of his own creation. His "evil principle" was in the shape of his two brothers; one of them an apothecary, who would send his card to him on a New Year's Day inscribed "Johann van Beethoven, Landowner" (*Gutsbesitzer*), and Beethoven would return it inscribed "Ludwig von Beethoven, Brainowner" (*Hirnbesitzer*),—a harmless pleasantry, certainly, but it indicates the bearing of the apothecary, bursting with pride at his success, when we remember that he refused to his face the slightest aid to the brother who had helped him to it, while he plundered him behind his back. The other was a banking officer, whose chief injury to Beethoven was in dying and leaving a son for him to take charge of. The mother was an immoral woman, and Beethoven was forthwith plunged into law suits, while the youth plunged as soon as he could into dissipation. An incident in one of the lawsuits affords a singular instance—alas, how bitter to Beethoven!—of what one may call his splendid simplicity. It was intimated to the court that the word *van* being of Dutch origin, and not ennobling a family in Holland, could not ennoble one in Germany, and Beethoven was accordingly asked to produce proofs of his nobility. "My nobility," he exclaimed, "is here and here," and he pointed to his head and put his hand on his heart. But that sort of nobility it was impossible for the court to understand, and they ordered his case to be transferred to the court for commoners, where he lost it, though he gained it in the end.

Helpless and awkward in every movement, spilling inkstands over his piano, breaking furniture when it came in his way; so tempestuous in his anger that if a waiter brought him the wrong dish of meat he would throw it, gravy and all, in his face, or if his cook gave him musty eggs for his soup would spatter her with them from head to foot; dashing the water over himself in his rooms in such floods that scarcely any one would have him for a lodger; sending a lady who had asked for a lock of his hair a tuft of goat's hair, and then apologizing when she discovered the deception, and never afterward speaking to the person who had suggested it to him; suddenly quitting a summer retreat, where he was supremely happy, because his host persisted in making him profound bows whenever he met him in his walks; constantly changing his abode from the north side of the city in May to the south side in August, and often having three lodgings at a time; this small, thin man, with his great head covered with bushy grey hair, and little brown eyes flashing bright or fixed and motionless as his thought possessed him, with long furrows in his chin, laughing like an ape in the midst of the wildest disorder, books and music and half-eaten luncheons and half-

emptied bottles, sketches for quartettes and Stracchino cheese, all mixed up together, deaf, and cheated and slandered—this great man, who they said never loved, though he never lived an hour without loving; who they said was parsimonious, though if he saved any money at all it was for a dissolute nephew who would have left him to die alone,—this abused Beethoven, who looked upon Händel as the greatest composer that ever lived, who silenced bores with a sarcasm and forgot his pupils for weeks together, and in his philosophical discussions would never permit the mention of thorough-bass or religion, which he declared were exhausted subjects—this man, so full of contradictions and absurdities and genius, was one of the kindest and purest of human beings. He who can comprehend his noble heart will not fail, as Schindler well says, to rank the man as high as the artist.

Of the divinity of his art no man ever had a purer conception. "Music is like wine," he says, "inflaming men's minds to new achievements, and I am the Bacchus who serves it out to them, and when they grow sober they shall find themselves possessed for ever of a spiritual draught." Solitary and poor, with so many infirmities that he was often tempted to curse his existence and to learn resignation from Plutarch, it was virtue alone, with its inspiring ideal, which upheld him in his misery and kept him from suicide. Shut out in great part from the world, tortured by suspicions, betrayed by those he loved, restless, anxious, wasted in body and mind, communion with God was his solace and his great strength. "I must live alone," he says; "yet I know that God is nearer to me than to my brothers in the art. I hold converse with him and fear not, for I have always known and understood him." Music, like her sister arts, was to him based upon morality, which was the fountain-head of all genuine inspiration. "Speak of me to Goethe," he says, "and tell him to hear my symphonies, and he will agree with me that music alone ushers man into the portals of an intellectual world ready to encompass him, but which he may never encompass." Goethe was spoken to, but Goethe understood not.

Sorrow illumined by the reconciling light from above, the martyrdom of earth glorified—that was Beethoven, says one of his critics. And the sorrow of earth, how it followed him to the end! In the summer of 1826, his nephew, driven desperate by his bad courses, attempted suicide, a crime which the law in Austria ascribes to a defect in religious education. The case was investigated, and the unfortunate youth committed to the charge of his uncle, with the injunction to leave Vienna in twenty-four hours. Returning home in the autumn, Beethoven caught cold, and his last sickness came upon him. He kept his bed, and his nephew went off to the billiard rooms and told the marker at one of them to send a physician to his uncle; but the marker was himself taken sick before he could do so, and, being carried to the hospital, remembered his commission, and the attending surgeon set off instantly to visit Beethoven. But it was too late; several days had elapsed, and the hand of death was heavy upon him. Yet his eccentricity never left him. When the landlady brought him an almanac to prove that the week was up and his rent was due, he sang the interrogatory motive of the quartette in F, op. 135, "Must it be?" and the woman, entering into his humor, stamped with her foot and said, "It must be!" and those words now stand in the superscription of the work.

The last thing he did was to make his nephew, who had so infamously abandoned him, his sole heir, and then musing said: "Do you hear the bell? The scene is shifting;" and it shifted, indeed, for the next act opened upon another world, whence we still seem to hear the echo of his words: "For my works I fear not. No evil can befall them. Whosoever shall understand them shall be freed from the misery that burdens mankind."

SHAKESPEARE'S DELINEATIONS OF INSANITY.*

Considering this book of long expected essays as a grateful tribute to the genius of Shakespeare by a most enthusiastic admirer, almost a worshipper, of the prince of poets, they can, of course, only be spoken of with praise. As a contribution to the study of Shakespeare they hardly command great or unqualified admiration. The writer being a physician to the insane, the chief thing of value to be expected in his work was that it would be the testimony of an expert in reference to the madmen and imbeciles whom the poet brings before us. And he does give us such testimony; but its value seems to be that of corroborative evidence only. To what we knew from other witnesses he adds almost nothing; and what he does add, and what he says when not speaking professionally, we are but doubtfully willing to receive. Still the essays will be found pleasant reading for an idle hour. We have most of us been *Rosalind's* lovers, and friends of *Valentine*, and confidants of *Romeo;* and who that has been will refuse to listen while one who also has known them and loved them chats with us of their sayings and doings, although what he tells us we have heard, perhaps, a hundred times before?

Much more than this the first few pages of the volume rather discourage us from expecting; for, after hearing two leading propositions which the author lays down at the outset, we are indisposed to trust confidently in his judgment or his information; and we read on, naturally distrusting theories and suspicious of facts which the author has seen fit, whether they need it or not, to support by extravagant assertions.

Shakespeare, Dr. Kellogg says, on the subject of physiology, anticipated the scientific discoveries and deductions of nearly two centuries; from the physiology of his own times it is quite evident that he could have derived no assistance whatever; in his age even the vitality of the blood was denied, and the denial has been the prevalent doctrine until quite recently. And these statements he supports by three quotations, one of which is from the play of "King John," where *Prince Henry* says of the king:

> "It is too late; the *life of all his blood*
> *Is touched corruptibly;* and his pure brain
> Doth, by the idle comments that it makes,
> Foretell the ending of mortality."

Another is the passage where *Romeo* asks the apothecary for a dram of poison, such

> "As will disperse itself through all the veins."

And another is where *Hamlet's* father tells his son how he was poisoned with juice of hebenon,

> "*Whose effect*
> *Holds such an enmity with blood of man,*
> That, swift as quicksilver, it courses through
> The natural gates and alleys of the body."

The italics are not ours, but the doctor's, and it is upon the italicized sentences that he relies for proof of the assertion not that Shakespeare's physiological knowledge was great and remarkable in a man of that period, but that it was peculiar to himself. Yet this is an assertion which ought not to have been made in all its breadth. Very little reading in the dramatists contemporary with Shakespeare would have convinced Dr. Kellogg that he was making too large a claim for his favorite. Thus, in a play of John Ford's, he might have heard *Giovanni* say to *Annabella*, whom he is about to kill:

> "Give me your hand. How sweetly life doth run
> In these well-colored veins; how constantly
> This pulse doth promise health."

And if it be said that Ford wrote plays for nearly ten years after Harvey had promulgated his great discovery or rediscovery of the circulation, it may be answered that it was never the habit of play-writers to put into the mouths of their characters as incidental remarks the expression of abstruse theories in science. The popular belief on this subject was not so far wrong as Dr. Kellogg seems to think. Marston more than once says "life-blood," and that is a word which does not show Marston totally ignorant of the vitality of the blood. No more do these other words of his, where *Antonio* murders little *Julio*, so revenging himself on the child's father:

> "It is not thee I hate or thee I kill,
> Thy father's blood that flows within thy veins
> Is that I loathe."

And in Beaumont and Fletcher's "Philaster," when the false page *Bellario* confesses her love for the prince, she thus describes the tremor into which she was thrown at first sight of him:

> "My blood flew out and back again as fast
> As I had puft it forth and suckt it in
> Like breath;"

language which makes it pretty clear that, whatever may have been the scientific squabbles of the Humoralists and Solidists, the blood of the poets had plenty of warm life and motion. Again, and lastly, this same John Fletcher, who died in 1625, three years before Harvey's discovery was made public, makes *Thenot* assure the *Faithful Shepherdess*, who thinks he comes to visit her because he has been charmed or has drunk some hurtful potion,

> "No beating vein conveys infection
> Dangerous to the heart."

The other of the two leading propositions of the author relates to Shakespeare's acquaintance with morbid psychological states, and is even more sweeping than the one just spoken of.

"To suppose," he says, "that Shakespeare obtained his knowledge of insanity and medical psychology from his contemporaries or from works on those subjects, is simply absurd;" and then he goes on to say further that "insanity was uniformly regarded by the contemporaries of the poet as an infliction of the devil. All the unfortunate sufferers by this dreadful malady

* "Shakespeare's Delineations of Insanity, Imbecility, and Suicide. By A. O. Kellogg, M.D., Assistant Physician State Lunatic Asylum, Utica, N. Y." New York: Hurd & Houghton. 1866. Pp. 204.

were supposed to be possessed by Satan." Does Dr. Kellogg imagine that Thomas Kyd conceived of lunacy as diabolic possession merely when he makes old *Hieronymo* go distracted? *Horatio*, his son, is stabbed in the garden, and the bereaved father, the servants say,

——"now his aged years should sleep in rest,
Grows lunatic and childish for his son."

And there are the unfortunates in Decker's hospital; none of them had a devil,

——"yet do they act
Such antic and such pretty lunacies
That spite of sorrow they will make you smile."

Nor is there anything astounding in the knowledge of the proper treatment of lunatics which is displayed by the physician in "Lear" who tells *Cordelia*

"Our foster nurse of nature is repose,
The which he lacks,"

when we hear Marlowe's *Edward II.* complaining from his dungeon,

"So that for want of sleep and sustenance
My mind 's distempered."

Dr. Kellogg with his great love for the poet will not feel inclined to give him a diminished admiration because it cannot quite be proved that Shakespeare was a medical man inspired. It was just as he excelled his contemporaries in depicting the workings of sane minds, and just because he excelled them in this, that he excelled them all in delineating the disordered movements of a mind distraught. To attempt placing his superiority on other grounds would be not beneficial but injurious to his fame.

Our author divides his book into three parts, the last treating of Shakespeare's suicides, for whom *Othello* stands representative. Under the head of Shakespeare's insane he ranges *Macbeth* and *Lady Macbeth*, who, he thinks, are not insane—still, the one saw an air-drawn dagger and the other walked in her sleep; *King Lear*, who is an admitted madman; *Cordelia*, not that she is mad, but because she shows the spirit which should govern all who come in contact with those who are mad; *Ophelia*, who certainly was crazed; *Hamlet*, whom Dr. Kellogg thinks so; and, very strangely indeed, *Jacques*, for no reason, apparently, except that Shakespeare calls him "the melancholy *Jacques*." Shakespeare's imbeciles constitute the second list, which is headed by *Bottom*, *Dogberry*, *Elbow*, and *Justice Shallow*, who, to our mind, is very unfairly treated when he is written down an imbecile. Still more unfair is it to give that name to the grave, affected steward of the lady *Olivia*, *Malvolio*, who "thought nobly of the soul," and whom our author looks on as the "brainless fop," whose "external, personal qualities are with him all sufficient, all in all," the prototype of the modern dandy in "flashy vest, tight boots," etc. *Bardolph* is another witless person, and so is huffing *Pistol*, with his wonderful power of quotation, and *Nym*, and last of all comes the singular imbecile *Caliban*, whom *Prospero* makes begotten by a devil on Sycorax his dam, and who seems to Dr. Kellogg to bear so strong a resemblance to a Port Royal or Fortress Monroe contraband that he gravely calls those negroes our Southern Calibans.

Of the character of *Jacques* Dr. Kellogg takes an original view. He finds in it a representation of a delicate shade of incipient melancholia. We find a shade of humorous melancholy in it, for *Jacques* is like all humorists; but what a perversion of language, as men count language outside of lunatic asylums, it is to call *Jacques* an insane man. And how plainly it is seen to be a mere perversion of language when, the insanity being assumed, the doctor proceeds to account for it and tries to find which "great mainspring of his mental and moral machinery has been broken and destroyed." He discovers which one it is in the following passage. *Jacques* and the duke and his companions are in the forest, and *Jacques* is moralizing. He promises, if invested with the motley, to speak his mind with perfect freedom—

——"and I will through and through
Cleanse the foul body of the infected world,
If they will patiently receive my medicine."

The duke cries fie on him and declares that the new preacher would do most foul sin in chiding sin:

"For thou thyself hast been a libertine
As sensual as the brutish sting itself,
And all the embossed sores and headed evils
Which thou with license of free foot hast caught,
Wouldst thou disgorge into the general world."

Giving its literal meaning to this remark, the utterance of which he stigmatizes as a very ungentlemanly act on the part of the duke, and giving the word libertine the special meaning which it bears to-day, the author is "forced reluctantly to believe" that the profligate life led by *Jacques* before we meet him in the forest of Arden had been so punished by disease as to disgust him with the world, and he had become transformed from a debauchee to an impotent railer at pleasures which he could not share. We would a little rather have met *Jacques* among the imbeciles, if it was necessary that there should be an essay about him at all. Apparently a sane man who has once been put into the *Journal of Insanity* finds it as difficult to get released from the doctors as a sane man who has been put into an asylum.

In the view of *Lear* here presented we find nothing new except the theory, briefly enunciated and unsupported by anything but the essayist's authority as a physician, that the king had always been partially mad. He dissents from *Regan's* and *Goneril's* opinions of their father that he was a passionate man, always peevishly or fiercely wayward, inconstant, and impetuous, and also from the opinions of the critics, that the bitter insults and heart-sickening injuries of his thankless, wicked daughters, operating on a loving, vain, generous, domineering soul, raised within it a storm sufficient to overthrow a mind naturally not too strong. That *Lear* was a man who might easily be driven mad when placed in such circumstances as the poet has thrown around him, anybody will admit; that *Lear* was always more or less insane, everybody would rather see proved before they assent to it. But they would rather not see it proved. Medical psychology might gain, but poetry would lose if the tremendous drama of "Lear"—the spectacle of a mind destroyed by unnatural injuries, of the greatest of calamities inflicted by the greatest wickedness—were changed into Dr. Kellogg's *Lear*—the ravings, the sublime ravings, of a person laboring under frequent attacks of mania, together with practical directions for the management of the patient.

The Prince of Denmark, of course, is insane. Into the general question of *Hamlet's* madness we do not intend to go. This is a not unfair statement of Dr. Kellogg's theory: Suddenly, in the twinkling of an eye almost, when he has learned that his uncle, *Claudius*, has been guilty of great crimes, the "lion-hearted" nephew, who hitherto had shown "no weakness, no vacillation, no want of energy, no infirmity of purpose," goes crazy. His intellect continues to be acute and is not greatly shaken. But in the paroxysm, the volcanic eruption, consequent upon a sudden revelation of the fact that his uncle had killed his father, the man's will is paralyzed and thenceforth useless. Force and energy vanish. This is shown by his first exclamation after the radical change has occurred:

"O all you host of heaven! O earth! What else?
And shall I couple hell?—O fie—hold, my heart;
And you, my sinews, *grow not instant old*."

Adopting this theory, of course everything that is hard in *Hamlet's* character and actions is easily accounted for, "insane with lucid intervals" being an explanation which, it is hardly too much to say, will fit the life and character of any man except men always insane. This particular theory of an almost instantaneous paralysis of *Hamlet's* will, of his moral nature, is, we believe, a new one. That such paralysis is in itself, scientifically, a medico-psychological possibility, we are willing to receive, on Dr. Kellogg's word. That in the case of *Hamlet*, as Dr. Kellogg describes him, the cause, as Dr. Kellogg describes it, is adequate to the production of the effect, seems to us a thing not to be received, and we should prefer considering the problem unsettled, particularly as in our opinion the facts in the case do not require any theory of insanity as insanity is usually understood outside of jury-boxes.

The pleasantest reading which we find in the book, and we think the most discriminative Shakespearean criticism, we find in the little essay entitled "Launce." As an average specimen of the author's style and of his general weight and force we extract a sentence or two from it:

"*Launce*, like many in life of far greater Christian pretentions and of far greater intellectual if not moral proportions, appears not to have been unsusceptible to the influence of money in the formation and direction of matrimonial alliances. With him, as with others, wealth appears to have been a cloak whose ample folds were sufficient to cover a multitude of vices, for though she have 'more faults than hairs,' the wealth was all powerful to 'make the faults gracious.'"

If an orthographical error is noticed in the first line of the extract, we would say that it is by no means the only proof of carelessness that we have observed in reading the book, which, however, is quite neat in most respects.

A Summer in Skye. By Alexander Smith. Popular edition. (Alexander Strahan, London and New York.)—Our opinion of this book was given on page 788, Vol. I., of THE NATION, and it only remains for us to speak of its present appearance or re-appearance, for it comes to us this time under a different imprint. We must say, then, that for a "popular edition" it imputes indisputable good taste to the people implied, and that the fastidious persons whom it precludes from purchasing it are very much to be pitied for the deprivation, or very much to be envied for the excellence of the typographical standard which puts them outside the pale. We are afraid that the public which will consume this edition is after all a limited one, and we are not sorry—at least on the public's account. There are better models of style than Mr. Smith's, and livelier reading than his "Summer in Skye," and better sources of information about the Scotch man and nature and scenery.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

THE UNITED STATES AND THE FENIANS.

THE House of Representatives took the extraordinary step, on Monday last, of referring, for consideration, to the Committee on Foreign Affairs, a proposition for the repeal of the neutrality laws, for the avowed purpose of letting the Fenians get at the Canadians and the British Empire generally. There is, of course, very little chance that the committee will report in favor of any such scheme, or that, if it did, its report would be acted upon. The object of the mover, Mr. Ancona, was, probably, to secure the Irish vote this fall, and that of the majority generally was, probably, partly to express their sense of the manner in which this country has been treated by England, and partly to place Mr. Johnson in a somewhat odious light before a class on whom he has now largely to rely for support and commendation of "his policy." The Fenians have been greatly elated by what has taken place, but they will probably find out, when the proper time comes, that in this as in other cases "fair words butter no parsnips," and that the office of avenging American wrongs will not be allowed to fall to them.

A good many people, of more sense and discrimination than the Fenians, however, will probably be somewhat befogged by Mr. Ancona's resolution—the more probably, as he and those who followed him were careful to "demand the previous question," in accordance with the amiable custom which we discussed a fortnight ago, for the express purpose of preventing discussion upon a matter which stood pre-eminently in need of thorough discussion. His resolution was just one of those which will not bear discussion, and for the defeat of which discussion is intended. There was absolutely nothing to be said for it, and if anybody had attempted to defend it, the chances are that everybody else would have been ashamed to vote for it after a full exposition had been made of the arguments in its favor.

That this language is not too strong to be used about it, will be apparent to anybody who considers what the real question is which presents itself to the American public when deciding upon what course should be pursued towards the Fenians. It is not whether the Fenians have good cause for making war on England. It is not whether Ireland is entitled to national independence. The Fenians may have "the holiest cause that tongue or sword of mortal ever lost or gained," and yet it may be highly wrong for them to assert it, or make preparations to assert it, on American soil. If all the people in the world who are, or think themselves, oppressed or outraged were to establish themselves here for the purpose of fitting out expeditions against their enemies, the United States would speedily be converted into a pirates' den. All kinds of mock wars would be got up for purposes of plunder. There would be numberless companies organized by needy gentlemen for the purpose of conquering Russia, Prussia, Austria, Spain, and Great Britain, and various other foreign powers, and their operations would consist mainly in the robbing of enemy's merchantmen. These wars, too, would possess the (to one of the parties at least) pleasing peculiarity of being interminable. There would never come a time when the Fenians would be found ready to make peace with England, the Hungarians with Austria, or the Poles with Russia. When a belligerent has only an "office down town," or "desk room," there is clearly no bringing him to terms, except by buying him out; and even if he were bought out, there could be no security that he would not declare war again next day if he found himself short of money.

Nor has the behavior of England to the United States during our war the least bearing on our duty towards Roberts, Sweeney, and company. England either fulfilled her obligations towards us or she did not. If she did, we are doubly bound, first by law and then by gratitude, to see that hostile expeditions are not fitted out against her on our soil. If she did not, it is our prerogative to exact satisfaction of her. But whether we shall exact satisfaction or not, and, if we do exact it, when we shall do it, is for the President and Congress to decide, and their decision it is the duty of the army and navy exclusively of the United States to execute. It is impossible to enforce this doctrine too strongly. There is a vague notion afloat that when the country has been wronged by a foreign power, anybody who happens to know of it, and likes to take the risk, is justified in taking a shot at the wrong-doer, and is entitled to the sympathy and support of the public if he comes to grief in so doing. Naval officers in particular have very loose ideas on this subject, and every now and then break away from their instructions for the purpose of carrying out some policy or other which they have evolved from the depths of their own consciousness, and think the Government ought to adopt. We hold, however, that the national honor is and ought to be lodged in the hands of the Government; that it is the business of the Government only to take care of it, and that all attempts on the part of individuals to take this duty out of their hands is more than an impertinence. It is an attempt to undermine the discipline on which our whole political fabric rests, and to destroy the responsibility without which our whole system of government would be a clumsy sham. It is absurd to hold Mr. McCulloch answerable for the proper administration of our finances, and Mr. Seward for the proper conduct of our foreign affairs, and the President and Senate for the maintenance of the national honor, the national dignity, in the eyes of the world, if a portion of the war-making power is reserved for any Roberts, or Sweeney, or B. Doran Killian who can persuade a band of adventurers and ragamuffins to follow him with fife and drum to the frontier.

We also object to the Ancona resolution, and we think the silence which most journals, except the *Evening Post*, have observed with regard to it to be very reprehensible, because that resolution in terms gives the sanction of Congress to the disgraceful and humiliating theory that occasions may arise in which the United States may be either unwilling or unable to avenge its own wrongs, or to vindicate its own honor, and ready to leave the task to brigands surreptitiously organized in defiance of its own laws. If there is any good reason to be found in our relations with England, either past or present, why Canada should be invaded or English commerce cut up, General Grant or Admiral Farragut is the proper person to do it, and the President to decide when it is to be done. Mr. Johnson is not by any means our ideal chief magistrate, but we think far too highly of him ever to wish to see him entering into an alliance offensive and defensive on behalf of the American people with "President" Roberts of the Bowery.

CAPTAIN LEMUEL GULLIVER AS A PUBLICIST.

WHEN that only authentic traveller, Captain Lemuel Gulliver, was sojourning in Houyhnhnm land—the country where horses are the reasoning race and men the beasts of burden—his four-footed master used to question him as to the customs and history of the strange region from whence he came. Among other things he was curious to know the causes for which the Yahoos of Europe (such being the designation in that country for the inferior race) went to war with one another, after he had come with infinite difficulty to know what "war" meant. Captain Gulliver, with an accurate knowledge of history and international law which would have done credit to an ambassador, told him that "sometimes the quarrel between two princes is to decide which of them shall dispossess a third of his dominions, where neither of them pretend any right. Sometimes one prince quarrelleth with another for fear the other should quarrel with him. Sometimes a war is entered upon because the enemy is too *strong*, and sometimes because he is too *weak*. Sometimes our neighbors *want* the things which we *have*, or *have* the things which we *want*, and we both fight till they take ours or give us theirs;" with much more excellent discourse as to this particular phase of our Christian civilization.

Now, although it was so long ago as the 9th day of May, 1711, that Captain Gulliver first set foot on the shore of that interesting country, which, unhappily, hath never been re-discovered, the history of Europe for the last three years could not be more accurately described than in

these words of this admirable voyager more than a century and a half ago. For instance, the Duchies of Schleswig and Holstein have appertained to the crown of Denmark for more than four hundred years. They appertained to the crown, as we apprehend, and not to the person of the monarch, inasmuch as the throne of Denmark was not hereditary but elective for two hundred years later—though, as the choice always fell in the line of descent of Count Christian of Oldenburg, through whom they were annexed, we may be mistaken in this particular. A little more than two hundred years ago, in 1660, the reigning monarch, Frederick III., afforded Louis Napoleon one of the many historical precedents, on a small scale, for his *coup d'état*. By skilfully concerted manœuvres he succeeded in making himself absolute king, with the crown hereditary in his family. Although Frederick III. thus, like his predecessor King Claudius,

> —"from a shelf the precious diadem stole
> And put it in his pocket,"

there was this special distinction between this conveyance of his and *le crime du deux décembre*, that his larceny was accompanied by no bloodshed. It is altogether likely that there will also be another difference in the remoter consequences of the two acts, inasmuch as the Majesty of Denmark transmitted his sceptre through six or seven generations of descendants down to the year 1863. But that is aside from our purpose. Holstein, though a dependency of the Danish crown, was a member of the Germanic Confederation, which Schleswig was not, the former duchy being mainly German in the constitution of its population. Our readers will remember the Schleswig-Holstein war which arose in 1848 for the purpose of separating them from Denmark, but which was put down by the rest of Europe and their relations left *in statu quo*. In 1852 the late king, Frederick VII., in contemplation of the extinction of the direct line of Frederick III., like a prudent prince thought to provide for the peace of his dominions by having the succession settled during his lifetime. He accordingly, with the entire good will of his subjects, selected his near relative, the present King, as his successor, who ascended the throne on his death, in 1863, as Christian IX., with apparently as good a title to all the dominions belonging to it as could be given.

For Frederick VII., by way of making assurance doubly sure, called in the great Powers of Europe to sanction his arrangement. Accordingly, France, England, Austria, Russia, and Prussia united in the treaty of 1852, by which the succession to the Danish crown and its dependencies, including the duchies, was secured according to the king's plan, Russia renouncing any claim of hers to Holstein on the failure of the male line. To this arrangement almost all the other lesser powers —Sweden, Holland, Belgium, Spain, Portugal, Sardinia, Tuscany, Naples, and Greece—also signified their assent. There was also a possible claim to Holstein, since the Salic law, excluding women, was in operation there, as we stated a few weeks ago, which might be urged by the Duke of Augustenburg. This claim was of a very dubious quality, and probably could not have been maintained; but to make everything comfortable and extinguish every adverse title, a handsome pecuniary equivalent—about, if we remember right, two millions of dollars—was paid to put an end to this pretension. If ever an estate was satisfactorily settled during a man's lifetime, surely it was that of Frederick VII. So he slept with his fathers, and Christian reigned in his stead. But not in peace, for the dispute as to the duchies arose at once, or at least as to Holstein. The Diet of the Germanic Confederation set up the Augustenburg claim, notwithstanding the renunciation of it by the family for a valuable consideration. The success of Italy had revived and made more intense the idea of German unity, and hence arose the excitement in Germany on this matter, when it was thought that Holstein at least might be severed from Denmark and erected into one of the small principalities. The pretext was that the Confederation had not been a party to the settlement. But it would have kindled afresh the fires of revolution yet smouldering beneath the ashes of the reaction if this agitating question had been submitted to the decision of the Diet. But the principal members of the Confederation were consulted, and Würtemberg, Hesse, Hanover, and Saxony assented to the arrangement. Denmark not consenting to divest herself of one of the ancient jewels of her crown, the Diet ordered federal execution, or the enforcement of its pleasure by the combined arms of the Confederation. Accordingly, Hanover and Saxony, notwithstanding their accession to the treaty of 1852, took armed possession of the duchy. The King of Denmark did not resist this demonstration, as the Diet had the constitutional power to give the order, and retired behind the boundary line separating Holstein from Schleswig, ready to resist an attack there, and awaiting the vindication of his rights under the treaty by the signataries thereof.

Up to this point Prussia and Austria had been only distant spectators. But now Prussia, inspired by Bismark, was moved to put herself at the head of the Confederation and vindicate the injured rights of Augustenburg, and Austria joined with her to see that she did not go too far. So they marched with 80,000 men upon the line of the Dannewerk, behind which were 15,000 Danes arrayed against them. This little band made a gallant resistance; but what could they do? The 80,000 bayonets were irresistible arguments. Then followed the Conference of London proposed by England, into the particulars of which we have not room to enter. The great Powers had the power, if they had the will, to compel the fulfilment of the treaty of 1852. But it could only be done by war, and England could not venture to fight, with America standing ready to reciprocate her neutrality towards herself. And France saw that a fight could hardly go wrong for her, and that without her armed interference, at least till it was well over. Prussia and Austria demanded the cession of both the duchies as the right of the Duke of Augustenburg. The French Mephistopheles suggested leaving the question to the suffrage of the population. Holstein was first offered, and then a part of Schleswig besides, only leaving Denmark a defensible frontier. But Mephistopheles only murmured, "Let the people decide by universal suffrage."

This solution could not be accepted by any of the Powers on general principles, and especially by England and Russia, as the vote would be a foregone conclusion against Denmark. So the Conference broke up, the war went on, the fifteen thousand fought a good fight against the eighty thousand; but the plucky little dwarf had to yield to the two overgrown giants, and the two duchies were ceded by the King of Denmark, by the treaty of Vienna, in 1864. It would seem now as if the federal execution was complete, and that the two executing Powers had nothing to do but to leave the disposition of the duchies in the hands of the Diet. Not at all. The Hanoverian and Saxon troops, which occupied Holstein by the orders of the Diet, were peremptorily ordered by Prussia to go about their business, which they did. Then the coast was clear for Augustenburg, who could be put in possession of his rights at once. Nothing of the sort. He was told to go about his business, too, until the syndics of the crown could settle the law of the matter. In the *interim*, by the Convention of Gastein, Prussia was to hold Schleswig, and Austria Holstein. In due time those learned pundits, the syndics, pronounced their oracular decision—and what was it? Why, that neither the Duke of Augustenburg nor the Confederation had any rights in the duchies—that they belonged to King Christian IX.! Of course they must be restored to him. Oh, no; he had ceded them to Austria and Prussia, and so they were the lawful owners in fee! Could Gulliver have invented a case more pat to illustrate his public law? The Confederation which had no right to the duchies goes to war with the rightful owner for the Duke of Augustenburg, who also has no right to them. Prussia and Austria, who never pretended to have any right to them, came to the help of the robbers, and, having wrested the prey from the owner, claim that it belongs to them! At least Prussia does, for Austria does seem a little ashamed of her share in a transaction which only inures to the advantage of her Germanic rival, and holds that the duchies should be given up to the Confederation. Out of this quarrel between these accessories about the booty a general war impends over Europe! Italy seizes the opportunity to get Venetia. Prussia sides with her as against Austria. And France eggs them on for the pickings that will be sure to fall to her share. Prussia and Italy may prevail against Austria, but France will get Sardinia and the Rhine frontier, for permitting it. And thus another axiom of the sage Gulliver will be illustrated, that "war is justifiable when we need a town or territory to make our territories round and compact." Public morality would not seem to have mended much since his Houyhnhnm course of lectures on the subject.

SOME OF OUR SOCIAL PHILOSOPHERS.

THE riddle of the painful earth is naturally more guessed at in the middle of Yankee land than in other regions. Down South one rather exacting social problem and the nocturnal patrol duty which its presence entailed, distracted all attention from other questions of like nature. These are mostly of recent growth, and our Southern brethren were still bowing down to Dr. Johnson in literature, Dr. Jalap in medicine, Dr. John Knox in religion and theology; and in sociology, so far as it has been studied, Dr. Nott and Mr. Legree were pretty good authorities up to a very recent date. The negro and the Jewish Scriptures of the Old Testament beat the Gospels and the Reformers quite out of the field. In Baltimore, to be sure, the author of "Emily Chester" was produced, but that apotheosis of goose-flesh was preceded by nothing like it and followed by nothing like it—it was paroxysmal and exceptional, and, besides, before it was published, Maryland was a free State.

Here, in New York, we have Carl Benson, and we used to have Fanny Fern, who now and then shed us a ray of light on social questions. But the latter has long been mute, we believe, and the fern leaves are blown away, vanished out of sight and out of mind. The former makes less impression than, with his abilities and opportunities, he ought, and we fear will never be very useful to American society. He seems to look at it from the window of his family coach; but this vehicle is so uncommon a *locus standi* for observers in this country that not many people can be at all expected to see things as he sees them, and he can never address a thoroughly appreciative audience till we get ourselves all ranged in ordered classes, with the proper gulf fixed between Dives and Lazarus, and Dives and Lazarus properly placed relatively to the gulf and each other. But that, it is likely, will never happen, Democracy being so much in love with itself. Though it is unwashed, ungrateful, fierce, and a failure, and makes the judicious grieve for these its many faults, it adds to them impudent self-complacency and robust perverseness; to commit suicide because only its friends like its behavior, and other people are really compelled to confess themselves hardly satisfied with all it does, it quite refuses. Privileged classes it will not set up, and talking to it about them is of no use whatever—labor lost.

In Massachusetts, however, we count them not by ones and twos; they are many. There are Mrs. Stowe, and the Autocrat of the Breakfast Table, and Gail Hamilton, and Timothy Titcomb, and the author of "Moods," and the author of "Young Knighthood," and not a few more who, if they do not speak for themselves, need never, in Massachusetts, be at a loss for some league or association to speak for them. If Carl Benson habitually conceives of existence from the point of view of a wealthy gentleman with town-house and country-house, to whom life comes in seasons—as the season for woodcock, for yachting, for returning to the city; who possesses butler, picture-gallery, library, and many ounces of plate, Mrs. Stowe as habitually conceives of it as a succession of forenoons with chores and housework, and an occasional story of a squirrel to a small nephew hanging round the bread-tray, and a succession of afternoons with knitting and a book at home; abroad, a soldier's aid association, perhaps, or Dorcas society; perhaps a run into Messrs. Williams & Everett's; and perhaps a call on Mrs. Marvyn, who, we suppose, must now be reading "Ecce Homo," or pensively perusing "Les Apôtres," for the improvement of her time and mind.

She is shrewd and humorous and often poetical, but above all things she is matronly and motherly. "Uncle Tom's Cabin" is slavery exposed; but slavery as it affects the mansion of the master and the hut of the slave, the domestic relations, the life of the hearthstone, and only incidentally is it revealed in its other aspects. It was the shiftlessness of its household management more than its wickeder features which was most trying to the soul of Miss Ophelia. Dred, and Agnes of Sorrento, we are not, as yet, familiar with, but the "Minister's Wooing"—certainly it was carried on amid notable housekeeping and much dress-making—and Dr. Hopkins's singing angel of a Mary Scudder, Mrs. Stowe, with characteristic wisdom, makes an excellent plain cook, as knowing that if the road by way of the eyes and ears is the shortest to a man's heart before marriage, after marriage, even in the case of saintly men, the shortest road lies down his throat. And nowadays being wise with the wisdom which it gives to bear, to nurse, to rear, to watch, to lay out the dead, to comfort the living, to order the household well, to chronicle small beer, and devise recipes, she naturally takes to the chimney corner, talking kindly, sensibly, wittily, and sometimes, let us confess, just a little prosily, as one may in one's own chimney corner; and all the young married men, and young married women, and those who contemplate matrimony, and gentlemen whose wives now and then nag viciously and show temper and will not be amenable to the voice of reason, and wives themselves, who, after all, it is to be remembered, can frequently on those occasions plead that inflictions sore long time they bore from servant girls, and these latter, perpetual emigrants—all may sit at her feet and learn of her the proper conduct of life in kitchen, parlor, and pantry.

The Autocrat of the Breakfast Table evidently by preference would be autocrat of the Monday morning breakfast table of an evangelical church-going family. It is a fresh sermon that he likes to take for the text of his monologue. And as it is not always Monday morning, he shrewdly gets board at a table where there is a divinity student, and so the dissection of dogmas is always in order. The particular dogma of future punishment and the hopeless eternity of it get attention in "Elsie Venner"—a scientific romance of the destiny which a physician can discern in blood and nervous tissue, the physiologist's flat contradiction of the Westminster divine. This is the motive, as the French would say, of works which not the Westminster divine himself would deny flow from a reservoir of observation and thought, and a natural fountain of wit and humor.

Timothy Titcomb Holland has such a Tupperian talent for truisms that his talent for truths can hardly be immense, so we hesitate the less about refusing to take his word when he informs us that in writing to young men and young women he is as a brother. A brother is of some particular sex, we at once reply, displaying an astuteness which reminds us of Timothy himself, and a conclusiveness which does not remind us of him at all. To him, as Shakespeare says he could, the poet of imagination all compact might give a local habitation and a name; but for us to decide upon where it is that he belongs is as difficult as it might be easy, and must be impolite, to say what it is that he writes. We had the advantage of reading him for the first time in an italicized copy of his works, too, for, before we had it from the library, it had passed through the hands of several young ladies. But this fact was of more value in showing us that he wrote either too feebly or just feebly enough for a young ladies' boarding-school than in aiding us to discover why he should write at all, or from what standing-point he viewed the world. Perhaps he knew some of the families too often to be seen which have on their book-shelf five secular books—Abbott's "Life of Napoleon;" "The Prince of the House of David;" a gift-enterprise illustrated work on India, China, and Japan; Headley's "Washington and his Generals;" and a combination volume containing the "Proverbial Philosophy," Henry Kirke White, and Pollok's "Course of Time"—and knowing them, decided to write as one who had found a market, and deliberately addresses these numerous families of the house of Titcomb as Mrs. Stowe addresses families in general, and Carl Benson our first families, and the Autocrat families with evangelical altars.

Of the sex of Gail Hamilton, whose new book is the cause of this article, there is not the least doubt. She is an unmistakable woman when Mr. Gilfillan is not her theme, not without the pertness and tartness with which every Halicarnassus is acquainted, with the audacity which knows it is charming, with a trifle of what a bachelor disputing with her might call the female tendency to brag that if she cannot argue she can *feel*, with the alleged willingness of lovely, lively woman not only to speak her mind, which is much, but to speak anyhow, which is something more. To charge her with occasionally dealing in platitudes is not possible, however, when her reader is just from the one weak, washy, everlasting flood of him of Springfield, whose greatest achievement is that actually to one collocation of words he has given a new meaning, or a new force to the meaning already supplied him. Flat as Holland now signifies a deader level than ever. Gail Hamilton, as she confesses, is theological, for she cannot help it, being essentially a Puritan. Mr. Vallandigham would not recognize her, nor Colonel L. P. Milligan, of Indiana, and we doubt if Mrs. Hemans would, or most painters in the grand style, or Professor Charles Kingsley (but this is a historical question), or any Englishman with "The Scarlet Letter" in hand; but let a man study the last developments of the spirit of Puritanism in its adopted and more kindly home, learn what Palfrey and Lowell can teach him, and visit Concord, a thing which can be thoroughly done without travelling, and he perceives that Gail Hamilton is a graceful twig, frequently a switch, perhaps, of the old Protestant stock. Equally with Cotton Mather or Jonathan Edwards she lives in a world which has heaven close above it and hell close underneath it, though hers is not exactly the heaven and hell of two hundred years ago; but the difference is not in the boundaries of her earth nor in the nearness of them. So, down on the farm in the hay country, the meeting-house in sight, the ancient church of Ipswich and the ancient church of Chebacco, with their incidental villages, not far away, she is theological and polemical and religious by virtue of being alive. "Summer Rest," her last volume, with a title, by the way, as pretty and as inconsequent as it ought to be, will show all her characteristics, warlike and otherwise, her surface flippancy and foolishness, her real earnestness and honesty, her womanly goodness and her good sense, her keenness of thought, her independence, her horrible and shameless puns, her frolic and sly humor, and dry humor and wit, and her eagerness to do to-day in her

generation what her Puritan fathers were doing generations ago in their day—working in the fear of God to free, so far as it may be freed, the human spirit.

THE EXCOMMUNICATION OF NOXIOUS ANIMALS BY THE CATHOLIC CHURCH.

THERE was published a few years ago, at Chambéry, a book now almost unknown, relating to the history of the Middle Ages, entitled "De l'origine, de la forme, et de l'esprit des Jugemens rendus au Moyen Age, contre les Animaux, par Léon Ménabréa." The object of the author, who was an uncompromising advocate of all the abuses of mediæval Christianity, is to defend the ecclesiastical tribunals before which the proceedings referred to in the title were conducted, against the imputation of "barbarity and superstition;" but the evidence adduced will be thought by most readers to support rather than to refute the charge.

"These proceedings," observes he, "were originally only symbolical in their nature, and designed to revive the sentiment of justice among populations who knew no right but the right of the stronger, no law but the law of intimidation and violence. In the Middle Ages, when disorder brooded over society; when the weak had no recourse against the mighty; when property was exposed to invasion, devastation, and rapine, there was something beautiful in the thought which assimilated the worm of the dust to the masterpiece of creation, and placed the one on a level with the other. If men were bound to respect the retreat of the caterpillar, how much more ought man to respect man—how much more ought each to conform to the rule of right! These ideas, by their very exaggeration, were calculated to make a lively impression on the mind, and to excite in the people a reverence for the social virtues."

The statement of the writer in regard to the original character and object of these proceedings is in direct conflict with his proofs, and I cite this *galimatias* not merely as illustrating the weakness of his argumentation, but for the sake of the admission, on the part of a devoted admirer of the civil and ecclesiastical institutions of the Middle Ages, that at the period when those institutions were in full vigor, when the Church of which he was a faithful son had the undisputed monopoly of moral and religious instruction, when the peasant knew no authority, human or divine, but those of the feudal lord and the priest, neither life nor property were in the least secure from arbitrary violence, and the people were destitute of the very notions of right, of law, and of "the social virtues." The proceedings in question profess no such object as Ménabréa ascribes to them; they were accompanied by none of the theatrical pomp with which Catholicism surrounds public observances, designed specially to impress the multitude, but were clothed in the hard, dry forms of ordinary judicial process; they were not, like the "Mysteries," which were got up for moral effect, conducted in the dialect of the people, but in a language intelligible to none but the priesthood. Their real purpose was to increase the dependence of the people upon the Church, as a power not only holding the keys of Heaven, but as able also to secure the temporal prosperity of its votaries by protecting them and their possessions against the material warfare of Satan.

Ménabréa insists that "at the period when ecclesiastical process against noxious animals was practised, men were not blind enough (*on n'était pas assez aveugle*) to believe that brute creatures were endowed with conscience," and consequently amenable to ecclesiastical jurisdiction. When he asserts that *men*—for, in this case, we cannot well translate otherwise the convenient, non-committal French *on*—were thus incredulous, he means, of course, the priests, who, doubtless, then believed as little, the people on the other hand as devoutly, in the supernatural powers of the clergy and the efficacy of their incantations, as they respectively do to-day in the miraculous liquefaction of the blood of St. Januarius at Naples, or the distorted eye-glances of the Winking Virgin of Rimini, both of which, be it observed, have been solemnly attested as genuine by the present "enlightened" Pontiff.

Our author takes much pains to establish what he considers an essential distinction between the anathema which it was usual to fulminate against vermin, and technical excommunication. It is to be doubted whether the subjects of the proceedings themselves attached great importance to the distinction. Probably the grub, the beetle, the army-worm, and the grasshopper, if consulted, would have cared little whether they were simply anathematized or more formally delivered over to Satan by the solemn ceremony of "candle, book, and bell." We need not be more critical than they, and even the Society for the Prevention of Cruelty to Animals may well concede to Mr. Ménabréa the benefit of his distinction. But it is, nevertheless, certain that in the official documents relating to these proceedings "excommunication" is often mentioned as the object and result of them, and there is no doubt that the sentence against creeping things was often handsomely garnished with the most highly-spiced cursing and swearing afforded by the rich vocabulary of the Church.

Ménabréa makes numerous citations from the records of process against noxious animals at different periods, and at the close of his volume prints at length two interesting documents, the first an essay in defence of such proceedings, published in 1668, by Bellay, an eminent Savoyard jurist; the other a somewhat mutilated record of a prosecution instituted, or rather revived, by *scire facias*, in 1587, at the instance of the syndic of the commune of St. Julian, before the bishop of the diocese of St. Jean de Maurienne, against certain noxious insects called *verpillons* or *amblevins*, which infested the vineyards of that district. From these rolls and other evidences it appears that the forms of process did not differ from those observed by the lay tribunals in cases where the accused were human beings. There was, first, a regular complaint or indictment, then a citation to the criminal, then the assignment of counsel for the defence—in this case a sort of *advocatus Diaboli*. After these preliminaries followed dilatory or other pleadings, the testimony of witnesses, the arguments of counsel, and finally the judgment of the episcopal tribunal. Imparlances were sometimes granted in the hope of an amicable arrangement between the injured prosecutor and the contrite offender; at other times the case was hotly contested to the definitive sentence. It is recorded by the great historian, De Thou, that Barthélémy Chassanée, one of the most eminent French lawyers of the sixteenth century, laid the foundation of his fame by the ingenuity of his dilatory pleas, and the general ability with which he conducted the defence of the rats of Autun, when indicted before the bishop of that diocese. Among other things he obtained repeated postponements of the trial by urging the distance which many of his clients were obliged to travel through a country much infested with cats, which were now especially on the alert in consequence of the notoriety of the proceedings.

The foundation of the jurisdiction of the Church over destructive insects and other noxious animals was the notion, which the priests industriously propagated, that these creatures were, if not incarnate demons, at least actuated and prompted by evil spirits, and this doctrine was affirmed by an infallible pontiff, Pius VII., as late as in 1803, in a case which we shall have occasion again to refer to. The point was, indeed, sometimes questioned, and the counsel for the defence argued that the accused were "creatures of God," consuming the food appointed to them in obedience to natural impulses; but this view does not seem to have ever been generally sustained.

At a comparatively early period ecclesiastical dignitaries appear to have acted upon their own motion against noxious animals. Thus, St. Bernard, observing, as he was about to ascend the pulpit, a huge swarm of flies buzzing about the church with the evident intent of driving out the audience and so depriving them of the edification they might otherwise reap from his sermon, excommunicated them on the spot, without giving them an opportunity of a hearing. "Excommunico eas," thundered he, upon which they fell to the floor and covered it to such a depth that it was necessary to shovel them out. St. Hugh, Bishop of Grenoble in the eleventh century, visiting the baths of Aix, found them much infested with serpents. He forthwith excommunicated the reptiles with such effect that, though they afterwards now and then playfully indulged themselves in a bite, their fangs were no longer venomous. St. Grat, too, in the time of Charlemagne, volunteered to banish the moles from the valley of Aosta and the neighboring districts, to the distance of three good miles, not much, I fear, to the satisfaction of the peasants to whose fields they retreated. St. James, the Assyrian, compelled a bear, which had feloniously killed an ox employed in his service, to take the place of his victim and help to draw the materials for the building he was erecting. St. William of Ecublens, Bishop of Lausanne between 1221 and 1229, banished the eels which had multiplied frightfully in Lake Leman to a retired spot, which they never dared to leave.

The power of performing these marvels appears to have been assignable to the laity, for the veracious Hämmerlein mentions a peasant of the neighborhood of Zurich who was in possession of an adjuration by which he could compel vipers, adders, lizards, toads, and worms to decamp, without beat of drum, from any place where their presence was inconvenient. St. Grat even conferred on a cisternful of water the power of expelling all manner of evil beasts. This potent fluid was naturally in great demand, and solemn deputations were sent across the Alps, by public authority, to obtain doses of it.

The priesthood of the Middle Ages were never slow in detecting opportunities of turning an honest penny, and there was evidently no reason why the miraculous power we speak of should not be matter of as good merchandise as the sale of indulgences. Accordingly, at about the time when Tetzel opened his booth in Germany, the clergy desisted from the gratuitous,

ex-officio exercise of their vermifuge functions, and thenceforth not so much as the simple curse of a mosquito could be had from them except upon sufficient consideration. In all the later records, the *sportulæ*, the official fees, figure at every step of the proceedings, and it is uniformly provided that the final sentence shall take effect only upon full payment of all arrears of tithes due from the complainant. Indeed, the judicious Chassanée, the highest authority on this subject, expressly declares that herein lay the operative virtue of the process: *Præcipuum remedium abigendi locustas est decimas solvere.*

It must be admitted, to the credit of the priests and the people, that they often showed a certain generosity to offenders in this kind; for, though St. Eldrad enticed the serpents about an abbey near Briançon into a cave, shut them up, and left them miserably to perish, yet the prosecutor and the judges were frequently content with the simple banishment of the culprits. In such case, they were sometimes allowed to choose their place of retirement, at others confined to a specific district marked by metes and bounds. Thus, according to Hämmerlein, in a case which occurred at Chur, the cockchafers were banished to "a wild and forest region, there to dwell and not to trespass on the neighboring grounds." A like sentence was given in a similar case in the diocese of Constance. In another, in the district of Chur, after a series of pleadings, it was decreed interlocutorily that the beetles complained of should withdraw upon being furnished by the prosecutors with a suitable place of retreat, and thereupon a written contract was entered into between the beetles, represented by their attorney, and the complainants, which was regularly renewed from year to year afterwards. The ground having been duly marked out, the beetles retired to it and faithfully remained within the appointed limits. This was evidently a great improvement upon the ordinary course, where the point was settled once for all, because the annual renewal of the contract implied, of course, the payment of fees *toties quoties;* but, perhaps on account of the pecuniary scruples of the parishioners, this excellent precedent does not appear to have been generally followed. In the sixteenth century, a portion of the Spanish coast being infested by rats, they were summoned before the bishop, who, climbing a lofty promontory, commanded them to dislodge. They plunged into the sea and swam over to a desert island, where they were ordered to remain. In 1690 the caterpillars at Pont du Château, in Auvergne, were banished to a little pasture and informed that they might live there in full liberty. In the case at St. Julian, the peasants offered to allow the *amblevins* the exclusive use and enjoyment of a hundred and forty or fifty acres of upland forest above the vineyards, covered with wild cherries, oaks, planes, willows, and other trees and shrubs, together with good grass, reserving to themselves, however, the right of way through the wood, of mining, and also of using the premises as a place of retreat in war time. Although we are informed that the insects generally obeyed the sentence, yet instances of contumacious refusal to comply with its conditions were not rare. In such cases, the Church proceeded to extremities against the offenders, intoned incantations against them, sprinkled them with holy water, fumigated them vigorously, cursed them right and left, rung the bells convulsively, and, above all, circulated the contribution-box briskly; in short, treated them as if they were little better than a troop of red-shirted Garibaldians making a raid on the Patrimony.

Through the whole of the sixteenth century prosecutions of destructive insects were extremely common, and they were still frequent in the seventeenth. The last example of the sort cited by Ménabréa occurred at Thonon, in 1731. This must have been a very grave case. The demons were evidently too strong for the local ecclesiastics, for several parishes united in the complaint and addressed themselves directly to Rome for relief. Our author thinks the practice was discontinued about this time; but I learn from an article in the "Rivista Forestale" for April, 1866, that as late as 1803, in the popedom of Pius VII., a pontifical brief was issued at the instance of the proprietors of the district of Marate, in the Brianza, confirming the belief of "the ancient Church" in the infernal mission of noxious insects, and pronouncing the papal anathema on the locusts which were wasting the fields of that fertile province.

I do not know that the present Pope, Pius IX., has ever indulged his fine taste for malediction in this particular way, but if he has not, it is because the faithful have been too faithless to give him an opportunity. It is evidently his aim to make his official acts an anthology of all the follies, all the political iniquities, of his predecessors—a sort of summary of papal misgovernment and abuse. The Pontiff who sanctioned the kidnapping of the boy Mortara and the girl Coen, and who issued the Encyclic of 1864, would certainly have no scruples about exercising his undoubted power to save the devout, who had duly paid tithes and Peter's pence, from the persecutions of the entomological Satans which lay waste the vineyards. For the comfort of residents and travellers in some countries which acknowledge his supremacy, it is much to be wished that he would extend his jurisdiction to certain insects of a more domestic character. I am clearly of opinion that a good, sharp papal anathema, supported by handsome donations—and in the case of thin-skinned and heretical foreigners, who suffer most from these latter annoyances, by a little Persian Powder, sold in Italy under the name of "Polvere Insetticida"—would prove as efficacious as the most energetic malediction of the Middle Ages.

FINANCIAL REVIEW.

NATION OFFICE, Thursday,
June 14, 1866.

GOLD has risen again. Yesterday it sold at 146¼; to-day it has been as high as 147¾; at 3 P.M. it stands at 147¼. Exchange is in active demand, at the highest rates of last week. The steamers of yesterday, instead of taking out $2,500,000, as was expected, took out $3,750,000. The increased demand for gold and its consequent advance are due to a general impression that the trouble in London is not yet over, and that further disasters are likely to accompany the liquidation. Not a little uneasiness prevails here on the subject of the gold export. We have in this city, available for export, about $5,000,000 in the banks. When this sum is exhausted, which will be in a week if the export enquiry continues, there will be no more gold to ship, unless the Sub-Treasury—which holds, net, about $35,000,000—should undertake to supply the demand. Under the circumstances, should the next foreign news prove unfavorable, a further advance in the premium would not be unlikely. The evil consequences of the wasteful sale of fifteen millions of Government gold at 130⅛ are not yet fully developed.

Money is abundant at 6 per cent. on call, and mercantile short date paper of the highest grade passes at about the same rate. The National Bank controversy at Washington presents no new features. On the one hand, the partisans of inflation are pressing on Congress their scheme for the issue of $100,000,000 more bank currency; on the other, the conservatives in finance are urging that body to commence measures of contraction on 1st of January next. Mr. Sherman's 5 per cent. loan bill is lost sight of, for the present; it is not generally supposed that it will pass.

The stock market has been generally inactive for the past day or two. Erie has declined to 59½ (to-day it sold at 59), partly on the report of a decline in the May earnings of $325,000, making a total decrease of about three-quarters of a million since New Year, and partly on the arrival of large lots of stock from the other side. The bulls have abandoned the attempt to make Mr. Drew responsible for the decline in the earnings of the road. The New York Central clique have again pushed up the price of the stock to 99. Whether they are making anything by these turns is not known. Reading has been up to 110 on the oft-repeated rumor of a June dividend. Michigan Southern remains pretty steady at the old price; "puts" at 79 and "calls" at 81 are in the market. Pittsburgh has fallen off in consequence of efforts by the clique to unload. It seems to be understood that there will be no summer dividend, and, under the circumstances, 80 would seem a very high figure for the stock. The North-westerns have fallen back after their brief advance, and are pressed for sale at prices 2 per cent. below those recently ruling. Rock Island is lower on sales of the stock created by the recent dividend. The reopening of the Mississippi is depriving this and other parallel lines of much business which they enjoyed during the war. Western Union Telegraph, the new fancy, after selling last week at 62, has been down to 56. The consolidated concern is said to be represented by $42,000,000 of capital; earnings last year $1,500,000. Governments are in better demand, and many look for an advance in 5-20s to correspond with the rise in gold.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	June 7.	June 11.	June 14.	Advance.	Decline.
United States Sixes of 1881	105¾	105¾	106	¼	....
5-20 Bonds, old	102⅜	102¼	102¼	....	....
5-20 Bonds of 1865	102¼	102¼	102¼	....	....
10-40 Bonds	96	96⅛	96¼	⅛	....
7.30 Notes, second series	102⅜	102⅜	102⅜	....	....
New York Central	98	97¼	98¼	1	....
Erie Railway	62⅛	62⅛	59½	....	2⅝
Hudson River	110	109⅝	110	⅜	....
Reading Railroad	109	109¼	109¼	....	....
Michigan Southern	79	79⅛	79	....	⅛
Cleveland and Pittsburgh	83⅛	83⅛	82¼	....	1¼
Chicago and North-western	30¾	30¾	30⅜	....	⅜
Chicago & North-Western, Preferred	61	60½	59¾	....	¾
Chicago and Rock Island	92¾	92⅝	91⅝	....	1
P., Fort Wayne, and Chicago	97¼	96	97¼	1¼	....

IMPORTANT CHANGE IN THE DIVIDEND PERIODS

OF THE

EQUITABLE

LIFE ASSURANCE SOCIETY

OF THE

UNITED STATES,

92 BROADWAY, NEW YORK.

ACCUMULATED FUND..... .....$2,000,000.

ANNUAL INCOME.....$1,000,000.

PURELY MUTUAL.

ANNUAL CASH DIVIDENDS.

At the request of their numerous policy-holders, this Society have determined to declare their dividends ANNUALLY IN CASH: the first Dividend will be declared February 1, 1867. The last Dividend declared on the quinquennial plan reduced the premiums in some cases more than 50 per cent., or doubled the policy during the next dividend period. It is believed, for the future, that no Company in this country will be able to present greater advantages in its dividends to persons assuring than this Society, as its total expenditure to cash premium received was, by the last New York Insurance Report, less than that of any of the older American Life Insurance Companies.—*See Superintendent Barnes's Annual Report*, 1865.

The new business of this Society for the past year ($13,623,900) exceeds the new business of any New York Company in any previous year.—*See Superintendent Barnes's Annual Report*, 1865.

Hereafter Dividends on the first annual premium may be used as Cash in the payment of the Second Annual premium, and so on thereafter the dividend on each premium may be applied to the payment of the next succeeding premium. Policy-holders in most other Companies MUST WAIT FOUR OR FIVE YEARS before any advantage can be derived from Dividends.

The success of this Society has not been equalled by any Company either in this country or Europe, the Society's cash accumulation being over

ONE MILLION OF DOLLARS

greater than the most successful Company at the same period in its history, and its annual cash revenue from premiums, at the end of its sixth year, was greater than that of the largest company in the country at the end of its fifteenth.

Non-Forfeiture of Premiums.

In the case of whole life and endowment policies at ordinary ages in force for at least three years, the Society will, on due surrender, issue a Paid-up Policy for the full amount of premiums paid.

The Company will issue Policies on a single life to the extent of $25,000, but only in cases where the physical condition and family history of the applicant are entirel unexceptionable.

Permission is given at all times to visit Europe free of charge.

Extra Permits granted at moderate rates.

WHERE TO INSURE.

UNION MUTUAL LIFE INSURANCE COMPANY.

NEW YORK OFFICE, 151 BROADWAY.

ASSETS, over	$1,500,000
RECEIPTS for the year, over	700,000
DIVIDEND paid during the present fiscal year	69,160
TOTAL DIVIDENDS paid	419,000
TOTAL LOSSES paid	944,042

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force. Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

THE NATION

For the guidance of those who may feel disposed to assist us with their contributions, we may mention that the contents of THE NATION will fall nearly under four divisions—or that, at all events, these divisions would have to be kept in mind by anybody writing for it as a volunteer.

1. References to, and concise comments on, the news of the day, with the view of fixing the degree of its importance, and suggesting its bearings upon and relation to the main current of contemporary history.

2. Reviews or comments, whether in the shape of letters or articles upon important events, and upon the utterances of those who are, or are trying to be, leaders of public opinion.

3. Accounts more or less detailed, or discussions of such occurrences in the social, literary, artistic, or scientific world as are likely to interest men or women of education and intelligence. Under this head we do not include mere gossip about nobodies, or advertising chronicles of the sayings and doings of quacks, daubs, penny-a-liners, dilettanti.

4. Critiques of publications or works of art of sufficient merit to make it desirable that the public should ever hear anything about them.

TERMS—$5 per annum; 6 months, $3.

When delivered by Carriers in New York or Brooklyn, $1 additional.

JOSEPH H. RICHARDS, Publisher,

130 Nassau St., N. Y.

PURELY MUTUAL LIFE INSURANCE.

New York Life Insurance Co.

ESTABLISHED 1845.

HOME OFFICE, 112 AND 114 BROADWAY, N. Y.

Assets, over $5,000,000,

SECURELY INVESTED.

This is one of the OLDEST, SAFEST, and most SUCCESSFUL life insurance companies in the United States, and offers advantages not excelled and, in some respects, not equalled by any other. It has paid to widows and orphans of the assured THREE MILLION FIVE HUNDRED THOUSAND DOLLARS. Its Trustees in New York City are of the very first and most reliable names.

It is STRICTLY MUTUAL, the policy holders receiving the entire profits.

Premiums received QUARTERLY, SEMI-ANNUALLY, or ANNUALLY, at the option of the assured. Policies issued in all the various forms of WHOLE LIFE, SHORT TERM, ENDOWMENT, ANNUITY, etc.

DIVIDENDS DECLARED ANNUALLY (for 1864 and 1865, each 50 per cent.)

The mortality among its members has been proportionately less than that of any other life insurance company in America—a result consequent on a most careful and judicious selection of lives, and one of great importance to policy-holders.

It offers to the assured the most abundant security in a large accumulated fund, amounting now to over

FIVE MILLIONS OF DOLLARS.

It accommodates its members in the settlement of their premiums, by granting, when desired, a credit at once on account of future dividends, thus furnishing insurance for nearly double the amount for about the same cash payment as is required in an "all cash company."

The annual income, exclusive of interest on investments, now exceeds

Two and a Half Million Dollars.

The following is a summary of the Company's business for the year 1865:

Number of Policies issued,	5,138
Insuring the sum of	$16,324,888
Received for Premiums and Interest,	$2,342,820 40
Losses, Expenses, and Dividends paid,	1,118,901 25
Balance in favor of Policy-Holders,	$1,223,919 15
Total Assets, January 1, 1865,	$4,881,919 70

THE NEW YORK LIFE INSURANCE CO.

Originated and introduced the *New Feature*, known as

THE NON-FORFEITURE PLAN,

which is rapidly superseding the old system of life-long payments, and has revolutionized the system of Life Insurance in the United States. It has received the unqualified approval of the best business men in the land, large numbers of whom have taken out policies under it, purely as an investment.

A new schedule of rates has been adopted, under which the insurer may cease paying at any time without forfeiture of past payments; and at the

END OF TEN YEARS ALL PAYMENTS CEASE ENTIRELY,

and the policy thenceforward becomes a source of income to him. To secure this result the annual rate of insurance must, of course, be somewhat higher. But almost any person in active business would greatly prefer paying a higher rate for a limited time, and be done with it, to incurring a life-long obligation, however small.

By the table on which this class of policies is based, a person incurs no risk in taking out a policy. Insuring today for $5,000, if he dies to-morrow the $5,000 immediately becomes a claim; and if he lives ten years, and makes ten annual payments, his policy is paid up—nothing more to pay, and still his dividends *continue*, making

HIS LIFE POLICY

A SOURCE OF INCOME TO HIM WHILE LIVING.

The only weighty argument offered against Life Insurance is, that a party might pay in for a number of years, and then, by inadvertence, inability, etc., be unable to continue paying, thereby losing all he had paid. The "New York Life" have obviated this objection by their

TEN YEAR NON-FORFEITURE PLAN.

A party, by this table, after the second year, cannot forfeit any part of what has been paid in.

☞ This feature, among others, has given to this Company a success unparalleled in the history of Life Insurance.

A credit or advance of twenty per cent. on account of dividends is given on this table if desired, at the current New York rate of interest.

☞ There has been paid to the widows and orphans of members of this Company an aggregate sum exceeding **$3,500,000.**

☞ The dividends paid (return premiums) exceed **$1,700,000.**

Parties applying for Policies, or desirous of connecting themselves with the Company as Agents, will please address the Home Office either personally or by letter.

MORRIS FRANKLIN, President.

Economical Housekeepers Use

PYLE'S SALERATUS.	PYLE'S O. K. SOAP.
PYLE'S CREAM TARTAR.	PYLE'S BLUEING POWDER.

Articles designed for all who want the best goods, full weight. Sold by best Grocers everywhere. Each package bears the name of JAMES PYLE, Manufacturer, New York

MARVIN'S

PATENT FIRE AND BURGLAR SAFE:

Superior to any others in the following particulars:
They are more fire-proof.
They are more burglar-proof.
They are perfectly dry.
They do not lose their fire-proof qualities by age.
Manufactured only by

MARVIN & CO., 265 Broadway.

721 Chestnut Street, Philadelphia.

Send for a descriptive Circular.

ESTEY'S COTTAGE ORGANS,

$100 TO $500.

These popular instruments excel all others in QUICKNESS OF ACTION, ROUNDNESS, PURITY, AND VOLUME OF TONE, accomplished by PATENT IMPROVEMENTS. The crowning perfection is the

VOX HUMANA TREMOLO,

a wonderful imitation of the sympathetic sweetness of the human voice.

They are strongly endorsed by Geo. W. Morgan, Wm. A. King, Chas. Fradel, and many others, the highest musical authority in the United States.

Good Agents wanted everywhere.

Send for illustrated catalogue or call at the New Warerooms.

GEO. G. SAXE & CO.,
417 Broome Street, N. Y.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.

Topics of the Day.

MR. THADDEUS STEVENS has come out with a magnificent programme for the settlement of the Mexican question. He is almost satisfied with our failure to drive the French out of Mexico during our late war; but was almost led, he intimates, to desire a bolder policy by the fact that Rome "declared war against a powerful nation when Hannibal was thundering at her gates." Mr. Lincoln and Mr. Seward must have overlooked this important circumstance. But Mr. Stevens is now for active and immediate operations. He cannot wait for the slow action of diplomacy, and, having compared the Mexican empire to Tripoli, Tunis, and Algiers, and Juarez to William of Orange, he proposes to lend Mexico $20,000 on a mortgage of Lower California, Sonora, Sinaloa, and Chihuahua, "which," says Mr. Stevens, "would make it perfectly safe." We should think it would; but why not make the loan a hundred millions at once?

AN aged politician is just gone. General Lewis Cass died at Detroit on Sunday morning in the eighty-fourth year of his age. Before he was twenty-five he was a member of the State Legislature of Ohio, and till he was seventy-eight years old he remained in public life, filling a great variety of offices, being, at one time and another, colonel, brigadier-general, governor, senator, commissioner of Indian affairs, secretary of war, secretary of state, ambassador to France, and only narrowly missing an election to the presidency, and filling them all with some credit, though no one thinks of giving him the name of statesman. He was a prominent figure upon the political stage in that long period which set in not many years after the Revolution and lasted till the rebellion, during which American politics were meanest and most corrupt, and he leaves behind him no very great or very enviable fame. His name will be handed down, but handed down to vague and careless remembrance, and the men of thirty years from now will think of General Cass as we to-day think of W. H. Crawford.

MR. HARRIS, of Maryland, on whom the *World*, we notice, does not bestow its gracious title of Disunionist, informed the House on Wednesday that, of course, the Southern States had a perfect right to secede; he himself did not join them only because the sovereign State of Maryland did not command it; furthermore, in point of fact, the secession was complete, and at present, with respect to the United States, the Southern States are so many foreign countries. The United States had been able to conquer them, and had given over "the noble citizens of the South to slavery and degradation;" but that had no power to change his convictions; he had always been, and still was, "an old line Democrat." The speech was a very curious combination of the view of facts which Mr. Stevens takes and the theories elaborated by a Southern State rights politician. Mr. Le Blond at once rose to his feet and, speaking for the Democratic party, denied that it held Mr. Harris's opinions. For the thousand and first time he could not see and did not believe that a thing which cannot be done by right may be done in fact. Perhaps he liked better another part of Mr. Harris's speech where the logic was looser. "Mary Surratt," as the orator impressively called her, was tried, condemned, sentenced, and then very speedily executed. "On with the gallows, the coffin, and the grave, the War Department thundered." Preston King not many months afterward committed suicide. Why? "It was the judgment of heaven upon him for refusing certain 'agents of mercy' admission to the White House on the day of the execution." But for him President Johnson might have pardoned Mrs. Surratt. And then Mr. Harris goes on to say that "Pontius Pilate delivered the body of Jesus to Joseph of Arimathea, but a worse than Pontius Pilate is here," and Mary Surratt's body is withheld from her friends! This horrible comparison we will not do Mr. Le Blond the injustice to suppose he was not more disgusted with than with Mr. Harris's deductions from the Resolutions of 1798.

THE New York *World* expresses its admiration of everything appertaining to Mr. Johnson, his policy, message, vetoes, speeches, logic, and invective, everything, in fact, which he has said, done, or produced, or failed to do, except his keeping Mr. Lincoln's cabinet in office, his delay in appointing the New York collector and in bringing Davis to trial. He will feel chagrined, when he finds how near he has come to being a perfect Chief Magistrate, to think that he should have omitted such trifling formalities.

THE *Army and Navy Journal* enjoys an honorable reputation as the first paper which applied common sense and trained judgment to the discussion of our military affairs, and it did us infinite service both at home and abroad during the war by substituting real criticism for the "gas" of the newspaper correspondents. We were, therefore, considerably surprised to find in it last week an article on the military aspects of Fenianism, in which the writer seems to have got so bemuddled by the question of "belligerent rights" that he gravely claims for the Fenians the credit of having raised "an army of 50,000 men." Nobody knows better than the *Army and Navy Journal* that there is no evidence that the Fenians ever got 10,000 men together, or even 5,000, at any one point—or that they ever had 1,000 in a state of organization; and that the collection of bands of volunteers from various quarters, paying their own travelling expenses, and without commissariat, or ordnance, or a foot of ground to brigade upon, is neither an army nor the simulacrum of an army. Articles of this kind coming from such a source are most mischievous, as they help the "centres" and "presidents" to bleed the servant girls more freely than ever.

THE proceedings against "President" Roberts, before Commissioner

Betts, have been abandoned, owing to the resolute refusal of some of the witnesses to testify, and the intimidation of others by the crowd in the court-room. Some of the commissioner's rulings were singular. No matter what the nature of the question, the witness was allowed to decline answering on the ground that he would criminate himself if he did so. Some of the questions which were fenced off in this way were about as capable of extracting an inculpatory answer as an enquiry about the weather or the crops. The prosecution, it was intimated, will be resumed before the grand jury, but nothing will come of the trial of the indictment, and, perhaps, it would be as well to let the whole matter drop, if drop it would. We trust the Canadians will not galvanize the movement by undue severity towards the prisoners in their hands.

The number of cases of cholera in this city is slowly but surely increasing, and if the hot weather had once fairly set in, it would seem safe to expect a violent outbreak of the disease. The accounts of the condition of certain tenement-houses in the Fourth Ward are, in spite of all the cleaning that has been done, still horrible in the extreme.

Governor Curtin, of Pennsylvania, proposes to have the Legislature of his own State, and, we believe, all others at the North, come together and at once ratify the constitutional amendments. We trust his suggestion will be carried out, so that by the Fourth of July the work of reconstruction may be complete.

Maria Syphax, a colored woman whose parents were servants of Mrs. Washington, has just been restored by the House to the possession of seventeen acres on the southern border of the Arlington estate, given her on her manumission in 1826 by G. W. P. Custis, respected by Gen. Lee, and interfered with by the general sale of the estate in 1863 for non-payment of taxes, under the act of June 7, 1862.

Mr. Judah P. Benjamin has been admitted to the English bar, the Benchers giving as a reason that they could not do less, seeing the readiness with which Mr. Edwin James was admitted to the bar in New York—a civility which they felt bound to reciprocate. It might be possible to arrange a general system of exchange, by which the obnoxious characters of each bar might be transferred to the other on equitable terms, and balances struck at the end of every year. Mr. Benjamin, we are afraid, however, is more indebted to his career as a Confederate for the refuge in which he now nestles, than to the auspicious appearance of Mr. James on our horizon.

The European Peace Congress has, as most people anticipated it would, proved a failure. We believe there is no case on record in which, when preparations for war had advanced so far as in this case, actual hostilities were averted by a general palaver. The great motive which, after all, is driving these great hosts to the field, is not Prussian greed, nor the general love of military monarchs for fighting, but the diseased condition of European states. The unnatural political division of the European soil is a permanent disease, which breaks out in war every twenty years, and will continue to do so until all government is based on the popular will. All wars, including our own, are caused by an attempt on somebody's part to impose on somebody else an artificial arrangement. As regards the effect of the coming struggle on ourselves, we have probably already felt it fully, if it be not a bull to say so. The long anticipation of the shock has, probably, done all that the shock itself could do. Gold is still running high, and Mr. McCulloch, having fired away all his ammunition at the speculators, and let them know it, is now at their mercy. The plan of keeping down prices by sales of gold will some day excite a good deal of amusement. Why does not the Government keep down the price of flour, which is now so exorbitant, by keeping a stock on hand and selling out on proper occasions? Nearly every argument that would justify its gold operations would justify this. There is only one way of keeping gold down permanently and paralyzing the speculators, and that is the reduction in the volume of paper, and this is the only purpose to which the Government can legitimately apply its surplus specie.

CONGRESS.

Washington, June 16, 1866.

As the fall elections approach, and dog-days draw nigh, there is an evident impatience growing among Congressmen to be gone. A disposition now prevails to limit the remaining legislation of the session to measures of cardinal importance, and a large number of bills which have been passed by the House or Senate will fail for want of time and patience to consider them in the other House. No new project stands much chance of becoming a law, and any patriotic gentlemen who may cherish the idea of persuading Congress that their pet measures are of great national importance, would do wisely to husband their time, influence, and expenses until the next session.

An analysis of the entire strength of the House majority on the constitutional amendment exhibits the following result:

Total number of members			184
Voting for the amendment	120		
Absent who would vote for it	23		
		143	
Voting against the amendment	32		
Absent who would vote against it	9		
		41	
			184
Union majority		102	

Supposing the 58 representatives to which the eleven States late in rebellion are entitled, under the existing apportionment, to be admitted, and to vote unanimously with the Democratic party, the opposition strength would then be 99 in a House of 242 members. The Democracy would then have to gain 23 members in all the States now represented to throw the Republicans into a minority in the lower branch of Congress.

DIARY.

Wednesday, June 13.—In the Senate, the House bill making appropriations for the legislative, executive, and judicial expenses of the Government for year ending June 30, 1867, was amended and passed. Mr. Sherman's bill to fund the debt of the United States was discussed.

In the House, the Senate joint resolution proposing certain amendments to the Constitution was discussed by Messrs. Finck, Rogers, and Harding, of Ky., against it, and Messrs. Spalding, Henderson, and Stevens in its favor. The joint resolution was then passed—yeas, 120; nays, 32.

June 14.—In the Senate, a bill for the better organization of the pay department of the navy was passed. The bill to fix the number and appointment of officers in the navy was amended so as to create the rank of admiral, with the annual pay of $10,000, and passed.

In the House, the credentials of Lewis Hanes, elected a representative from North Carolina, were referred to the Joint Committee on Reconstruction. The report of a Committee of Conference upon the bill to dispose of the public lands in late rebel States to actual settlers, white or colored, was agreed to. It limits the parcels to eighty acres for two years, and to one hundred and sixty acres thereafter, and requires parties entering lands until January, 1867, to make oath that they have not borne arms against the United States. Messrs. Windom and Harris made speeches upon reconstruction.

June 15.—In the Senate, the conference report on the Southern homestead bill was adopted. The House joint resolution appropriating about $160,000 to enable the people of the United States to participate in the Universal Exhibition at Paris, in 1867, was passed—yeas, 21; nays, 13. Adjourned to June 18.

In the House, a bill to establish a hydrographic office in the Navy Department, and to furnish nautical charts and books to navigators at cost, was passed. Senate bill to reimburse certain war expenses to the State of West Virginia was passed. Mr. Orth made a speech on reconstruction.

June 16.—The Senate did not sit. In the House Messrs. Julian, Niblack, and Kerr made speeches on the state of the Union. Mr. Stevens made a speech against the Franco-Austrian possession of Mexico, and Mr. Davis made a speech on the tariff. Adjourned to June 18.

THE FREEDMEN.

The Louisville *Journal* wisely concludes that "the freed people must be educated, taught self-control and all the enlightened ethics of the new era;" that "the younger negroes must be taught the elements of scholastic education;" and that "this work ought to be done by Southern men and women." It approves the action of the Episcopal clergy of South Carolina in organizing a system of education for the blacks of their respective parishes; and of the Southern Baptists, in convention at Russellville, Ky., who adopted (May 27) a report that "the former masters of the slaves should undertake their education for their new condition with energy and resolution."

—A correspondent of the *Tribune*, writing from Norfolk, gives the receipts for the quarter ending April 1 of the Freedmen's Savings and Trust Company. These amounted to $172,391 30. Of the sixteen branches the largest deposit was made at Beaufort, S. C., $46,118 78. Louisville deposited $33,033 78; Savannah and Vicksburg more than $12,000 each; Mobile nearly as much. North Carolina is poorest on the list. The largest single deposit mentioned was $700.

Notes.

LITERARY.

No better way can be found of straightening the popular mind on the question of reconstruction, which will be involved in the political campaigns of this fall, than by putting before every one, in compact shape, the official record of the various acts of the South and of the Government since the surrender of Lee. The issue is so simple that a mere statement of facts is enough for every unprejudiced person. It is very wise, then, for Mr. McPherson, the Clerk of the House of Representatives, to issue at this time the volume which he entitles "A Political Manual for 1866." In this he has included all President Johnson's orders and proclamations, his principal speeches, and his veto messages, with the bills vetoed, and the votes in Congress thereon; the action of the conventions and legislatures of the insurrectionary States; the recent legislation of those States with regard to freedmen, and the orders of commanding officers relative thereto; the various propositions reported by the Joint Committee on Reconstruction; besides all the usual political matter, records of votes, platforms, etc. The book will be published very shortly in cheap form in 130 pages, octavo, double columns. Mr. McPherson is already very favorably known as a compiler by his excellent and valuable "Political History of the Rebellion," published about a year ago.

—The fifth and sixth volumes of the German translation of Byron, by Otto Gildemeister, have just appeared, containing "Don Juan." The translator has succeeded in catching the spirit of the poem, and has kept it in his most literal rendering. The same stanza and metre are retained, and also the same odd rhymes. He not only, like Heine, rhymes *Theetisch* with *ästhetisch*, *Wasser* with *Oel Makassar*, *dreizehn* with *reizen*, but also *Europa* with *faux pas*, and *Suwarroff* with *Pfarrhof*.

—Viscount Combermere lived in two ages. He was in active service in the field ten years before the end of the last century, and only a short time ago, a field-marshal of England, he was living in and enjoying a society almost the direct opposite in character to that in which he was born and educated. He was at school at Westminster with Wynn, afterwards Speaker; with Litchfield, who became Duke of Bedford; with Henry Petty, who lately died Marquis of Lansdowne; and with Southey. In Westminster scholarship was no object; the boys were amusing themselves with drinking "hot-pot" in a cobbler's stall, with driving stages at full speed down the post-road, and with inventing conundrums that they gave to the clowns at Astley's, who repeated them with great success. After school he went to Flanders as a second-lieutenant, and in six years was a lieutenant-colonel. In India, at the Cape, in the Peninsular war, he served side by side with Arthur Wellesley, and at last won the barony of Combermere. Later commander-in-chief in the West Indies, and still later commander-in-chief of India, he gained new honors and a new title. A year ago he died, leaving an only son to bear his name, and to his third wife the duty of telling how he won it. His memoirs, by Lady Combermere and Captain Knolly, abound in interesting sketches of the many persons of importance with whom he was brought in connection. We catch new glimpses of Mary Chatham, of Georgina Townshend, and of Lady Hester Stanhope. Miss Townshend's letters contain some very entertaining accounts of George III. and the Queen, as well as of Nelson and Lady Hamilton; and Lady Hester's early show, the "young Arab."

—Iceland long ago became the reservoir into which flowed the legends of several Scandinavian races, or of one race altered by different climates and admixture of foreign blood. Norwegians of pure blood, and Danes from England, Scotland, Greenland, and the Orkneys, aided in settling it. The immense quantity of folk-lore which has been here preserved bears no proportion to the number of its inhabitants either in times past or present. The peculiar physical features of the island—the white ice rivers and the streams of red lava, the boiling springs and the volcanoes, the sky filled with ashes and the clear lakes, the long nights, the midnight sun, and the northern lights, the great contrasts of nature in a small space—are enough to account for this mass of legend. The manners and lives of the people have also contributed their share to the stories which fill the innumerable manuscripts of Copenhagen and Stockholm. Feasts prolonged late into the night gave audiences and poets; and as the family were "sitting in the dusk," the women, who have always been the chief saga-tellers, would relate the stories of the trolls. The author of the "Islendéngabók—Libellus Islandorum," Ari the Learned, owed much of his book to Thoridr, the daughter of the priest Snorri. The language of Iceland is still almost what the tongue of the Northmen was when it was understood in England, Norway, and the Northern Isles. This has especially contributed to the preservation of so many legends. A large number of these national tales were collected by Jón. Arnason, from which Messrs. G. E. T. Powell and Eiríkr Magnússon have just translated a second series of selections, with an introductory essay which treats of the whole subject of Icelandic legends, and is not only valuable to the student of folk-lore, but interesting to the general reader. The mythic series of Iceland does not consist, as in most other countries, of tales of gods, but of trolls and elves, and of variations on the ordinary fairy stories. Christianity was introduced into the country so early and took such a strong hold there that the stories of the old gods passed out of memory. Besides, they were all collected into the Eddas and Sagas, and there was no room for the exercise of the popular imagination. What was written on parchment was retained no longer by oral tradition. The tales are divided into ten classes, but they chiefly concern elves, ogres, and water-monsters, always giants, for dwarfs hardly had any existence in Iceland, and goblins and ghosts. The stories in general have a good moral tone, and, indeed, there is too much sameness in the way in which vice always gets punished and virtue rewarded at the end of the tale.

—Some of the latest publications relating to Oriental subjects are the fifth volume of "Le Maha-Bharata, Poëme epique de Krishna-Dwaipayana, plus communément appelé Véda-Vyasa, c'est à dire, le Compilateur et l'Ordonnateur des Védas, traduit complétement pour la première fois du Sanscrit en Français par Hippolyte Fauche, traducteur du *Ramayana*;" "Grammaire Javanaise, accompagnée de fac-simile et d'Exercices de Lecture, par l'Abbé P. Favre, professeur de Malais et de Javanais à l'Ecole Impériale des Langues Orientales;" "An Account of the Wild Tribes inhabiting the Malayan Peninsula, Sumatra, etc., with a Journey in Johou and a Journey in the Menang-Kabaw States of the Malayan Peninsula," by the Rev. P. Favre, apostolic missionary; "Recherches sur les Monuments qu'on peut attribuer aux six premières Dynasties de Manéthon, précédées d'un Rapport à M. le Ministre de l'Instruction Publique sur les Résultats généraux de la Mission, par M. le Vicomte E. de Rougé." This, the first fruit of the recent French scientific expedition to Egypt, is a royal quarto volume of 165 pages, with five plates in folio. To these should be added the revised and corrected third edition of the "Syriac Grammar," by Dr. George Phillips, of Queen's College, Cambridge, and "A Sanskrit Grammar for Beginners, in Devanagari and Roman letters throughout," by Max Müller.

—At the anniversary meeting of the Royal Geographical Society, held on the 28th of May, the founder's gold medal was given to Dr. T. Thomson, for his labors in the Western Himalayas and Thibet, and the patron's, or Victoria gold medal, to Mr. W. Chandless for his exploration of the Purus River. A testimonial of one hundred guineas was presented to Mr. P. B. du Chaillu, and a watch valued at twenty-five guineas to Moola Abdul-Medjid, for his journey over the Pamir steppe in Central Asia. The income of the society for the last year was £4,905 8s. 3d., the expenditure £4,307 4s. 5d. There was spent in expeditions £800 8s. 3d.

—The Russian Government is doing its part towards the progress of geographical knowledge. Not long ago an expedition explored the Kalmuk steppes, and especially the valley of the Manitch. The report is now being published. The plain of the Manitch has been found to be a salt desert which can never be made inhabitable. The Kalmuk steppe is divided into two zones; the highest is adapted for agriculture, while the other resembles the Manitch valley. A scientific expedition has also been organized by the Russian Government to proceed to the river Tchui in order to continue the scientific researches begun in 1864. It is numerous and well provided with instruments, and is divided into two sections—mathematical and physical. The former is under the direction of M. Charles Struve, director of the Pulkova Observatory, and will make astronomical and topographical observations. The latter will collect statistics of the industrial resources of Turkestan.

—Among recent English publications there are especially noticeable "Thoughts on Great Painters," by J. P. Davis; Mr. Henry O'Neil's "Lectures on Painting delivered at the Royal Academy;" "The Toilet and Cosmetic Arts in Ancient and Modern Times," by J. Arnold Cooley; "The Harmonies of Nature," by Dr. G. Hartwig, a work designed to establish the unity of creation; "The Journal of a London Playgoer from 1851–1866," by Prof. Henry Morley, consisting of reprints of dramatic criticisms published in the *Examiner*; "Twelve Months with Frederika Bremer in Sweden," by Margaret Howitt; "The Albert-Nyanza," by Samuel White Baker an account of Nile explorations; a volume of verse by Viscount Stratford de Redcliffe, called "Shadows of the Past;" "The Faire Gospeller," by the authoress of "Mary Powell;" and a translation by Lady Georgiana Fullerton of Silvia Pellico's "Life of the Marchesa Giulia Falletti di Barolo."

EDUCATIONAL.

NEW HAVEN has just concluded a "High School Discussion"—a local controversy involving important principles of wide application. Such controversies seem to come to all our growing towns, very much as the scarlet fever and the whooping-cough come to growing children. Escape is the exception. The discussion in the City of Elms, after various side issues were thrown out, seems to have turned on this radical question: Is the system of public schools maintained as a charity "for the poor and needy," or is it an institution "for the good of all," irrespective of classes—*i. e.*, for the benefit of the town, the State, the community? If the former view had prevailed, the high school would have been abolished; if the latter prevailed, the school was to be maintained. The popular verdict was given in the most emphatic manner in favor of "schools for all," and the high school was, therefore, sustained as an essential part of a vigorous and efficient system of public instruction.

—College catalogues are commonly dry enough to all but those whose names are enrolled upon them. Not so with the first annual catalogue just issued of "Vassar Female College, Poughkeepsie, on the Hudson." Like Minerva of old, this institution seems to have sprung full panoplied into being. There are thirty-one teachers and three hundred and fifty-three scholars. About half of the pupils belong in this State, and the remainder come in nearly equal numbers from New England, the Middle States, and the West. Nearly half a million of dollars, the gift of one person, has been expended on the grounds, buildings, apparatus, etc., of this institution. The regular course of instruction occupies four years. The "Bachelor's Degree" in Arts is to be conferred on those young ladies who comply with the requisite conditions. The price of board and tuition is $350 per year of forty weeks. Young men in "monastic" colleges will look with envious eyes on many of the arrangements in this "sister institution."

—The University of Virginia, which before the war was one of the best institutions in the South, has just issued a retrospective catalogue for the last five years. From this we learn that during the years from 1861 to 1865 the average number of students in all departments was fifty-four. The actual number now in attendance is two hundred and fifty-eight, who come from twenty different States. All the Southern States are represented, and there are seven students from the Northern States, including "Benjamin Wood, jr.," from New York city. Most of the former professors, Messrs. Gildersleeve, Schele de Vere, F. H. Smith, etc., remained at their posts during the war, and are now likely to accomplish more than ever for the promotion of sound learning. The former organization of the university appears to be maintained, at least in the essential features.

—"Ik Marvel," the Edgewood farmer, in a recent number of "Hours at Home," writing with respect to agricultural interests under the title *De Rebus Ruris*, has thrown down a gauntlet in the face of the managers of our so-called "agricultural colleges." Our readers are aware that a large amount of land was appropriated by Congress a few years ago for the promotion of instruction in the practical applications of science. As the effort to secure this grant was encouraged by the farmers' societies and clubs, the bill was popularly but wrongly called the "Agricultural College bill," for in fact it provided for all sorts of scientific culture quite as much as for those which relate to farming. Under this grant, scientific schools are growing up all over the country—although few, if any, of them have money enough either to establish shops for the training of mechanics, or to purchase farms for experimental culture. Mr. Mitchell, apparently yielding to the popular notion, enquires whether "the Congressional grant for agricultural colleges" is benefiting "the minds of those who hold the great mass of the land under control." He then adds:

"Looking at results thus far, I am strongly of the opinion that a few thousands devoted to the gratuitous distribution of one or two sterling agricultural newspapers would have worked more good to the farming interests than the millions which have been committed to the wisdom of the several State legislatures. Of course, I have no idea that these views will meet the concurrence of those who are fattening upon the spoils; and I reserve full discussion of the matter for some future paper, in which I shall name some of the reasons which seem to favor the establishment of experimental farms; where good methods of culture may be laid open for inspection, and some of the reasons why the scientific gentlemen who mostly control the funds are indisposed to assume their supervision and direction. Meantime, I am strongly of the assurance that the common sense of the country is largely disposed to ask of the scientific gentlemen who have been so generally the recipients of this congressional bounty some practical demonstration *upon the land* of the faith they hold and teach. There is a large respect for science in America, but there is also an infinite contempt for shirks."

In opposition to Mr. Mitchell, some of the most successful teachers of agriculture in this country have held that a farm was *not* a desirable addition to an agricultural school. Principles and methods are to be taught by books, experiment, and observation; but practice must be sought out of schools. Business management is as important in agriculture as scientific culture; but it cannot be so readily taught in an institution. A good farmer will come to books for principles; he will then apply them in the particular circumstances in which he is placed. But Mr. Mitchell is so skilful both with hoe and pen that the leaders of the agricultural colleges will find a foeman worthy of their steel.

—We have received from Montgomery, Alabama, the report of the State Superintendent of Education, presented to the governor, April 1, 1866. It is both a painful and a hopeful paper. It is like reading the "Lamentations of Jeremiah" to review with the author the record of the last four years, and trace the ruin of colleges and academies, the abandonment of schools, and the immolation of youth of tender age ("the grinding up of our seed-corn," as the executive of the State expresses it), and all this in defence of the direful system of negro slavery. It is painful to find a mixture of exultation with these sighs. Boys who ought to have been at school, says the report, "have borne their part in the great battles that have made our name and history *for ever glorious*." Battle-fields have been "consecrated by their valor and patriotism from Gettysburg to Mansfield." The college alumni "perilled their lives on the high places of the field," and "teachers exchanged the ferule for the sword, and the school-room for the camp." The desolations of war always make sad pictures, but the shameful causes of the war make these shadows still more gloomy.

On the other hand, we see light ahead. The superintendent recognizes that hereafter "our progress is to be upon new modes and new ideas." "Education is now esteemed true wealth; an inheritance beyond reverses, and that cannot be taken away." "Old habits, hereditary wealth, proscriptive position—all are more or less broken up, . . and the educated element will have peculiar advantage in the reconstruction following." No New England schoolmaster could plead more earnestly than the Alabama superintendent for an "educational revival." Even "political preaching" is invoked in behalf of "the cause." For example: "We make no apology for putting under the patronage of the Southern pulpit such a paramount interest. We are behind none in admiration of the singleness and purity which it has maintained, holding to its high theme and discarding the fanatical and political issues and intermeddlings that have elsewhere been a weakness and reproach. But (in short) the pulpit must sustain the schools. It is darkest before dawn. Alabama will soon see the sun rise."

A FRENCH VIEW OF OUR WAR.*

M. LAUGEL has long been known as one of the ablest contributors to the "Revue des Deux Mondes," and, fortunately for us as well as for his European readers, he was led to visit this country while the war was at its height and devote eight months to an examination of our society and government. Many foreigners of considerable ability have studied us for a still longer period to very little purpose. M. Laugel was, however, prepared for the task by thorough familiarity with our language and literature, and, what is of perhaps still greater importance, his connection with the country by marriage had for years not only quickened his interest in our history and progress, but made more plain to him many things in our manners and institutions which most Europeans—even the best read and most intelligent—can only see as through a glass darkly.

The difference of language and of social and religious ideas, and, above all, the difference of temperament and traditions would, at first sight, seem to render it difficult for a Frenchman to get at the secret of American life. For an average Frenchman to get a fair glimpse at man's relation to his fellows and to his God, of duty, interest, labor, rest, from the point of view, for instance, of the average American of strong religious feeling, is a feat of great difficulty. None but Frenchmen of rare powers and great culture could ever accomplish it, if it were not for the fact that nearly all French students of our society possess one qualification for the task which few Englishmen and few men of any other country can boast, and that is a thorough understanding of the exact nature and bearings of equality. This lesson, at least, the revolution of 1789 has taught every Frenchman. In fact, all Frenchmen understand it a great deal better than a great many Americans, for no Frenchman would think of asking you, by way of pushing you to the wall, if you talked of making men equal before the law, "whether you would like your daughter to marry a nigger or a hod-carrier, an argument which, in

* "The United States During the War. By Auguste Laugel." New York: Baillière Bros. 1866.

the minds of great numbers of natives, possesses to this day considerable force."

M. Laugel discusses the cause of the war; gives a clear summary of the events of the first three years of the fighting, and of the political agitation by which the fighting was accompanied, and which was part of the struggle which foreigners understood least and blundered about most frequently. This portion of the book, of course, possesses comparatively little value for Americans, though most useful and instructive to the audience to whom it was first addressed. He then gives some account of his travels in the West, and in generalizing on his observations he is engaged in that species of political writing in which Frenchmen most delight, and which, in the hands of a thoughtful and well-trained Frenchman, is a real work of art. The chapter on the "Populations of the West" is the best essay we have ever met with on what is, perhaps, the most curious and important theme in the whole range of American society. The West is the only portion of the Union where true democracy—democracy completely emancipated from the influence of feudal traditions and ideas—can be met with, and M. Laugel has sketched and analyzed it with the hand of a master. Now and then there are traces of too great a love of generalization for its own sake, and, perhaps, we might occasionally complain of too great a tendency to base conclusions of considerable importance on sentiment which is not always American. The following estimate of the influence of the German element on the American population, if not entirely new, is suggestive:

"There are in the Germanic race qualities and elements which are destined to rejuvenate the Anglo-Saxon race. The high culture of Germany has but few representatives on the other side of the Atlantic, and as yet Germany sends to America scarcely any others than the poorest and most ignorant of her children; but they carry with them the mysterious germs which in the old country have borne such marvellous fruit. In the land of their adoption, these germs will not always lie dormant; to the boldness and tenacity of the Anglo-Saxon race, they will add something new, something more simple and poetic. In a purely physical point of view much may be gained by the mixture of the two races; one is too nervous and irritable, the other too heavy and rustic; but their intellectual union will doubtless bear even more precious fruits."

M. Laugel's "Introduction" is, perhaps, that portion of his work in which his peculiar powers are best displayed, and we wish we had space to quote it entire. For acute analysis and clever sketching there is nothing like it in De Tocqueville. The following is a fine combination of both:

"An American is not fond of complaining; he is too proud and at the same time too clever; he knows that complaints are the cry of weakness; he is always contented with his house, his wife, his children, his horses, his fields, with the schoolmaster he pays, with the member of Congress for whom he has voted, the President to whom he gave his support. If he receives an insult, he says nothing to any one; he will treat his enemy as long as he can with an outside politeness, in order not to give him the pleasure of a noisy outbreak and insults. He is a sure and faithful friend, though he does not expect too much from friendship himself. He has few illusions, but he is happier than we are, for he never had any, and we suffer in losing ours. . . . . The Americans are unacquainted with those agonies of fine minds, nurtured on chaste thoughts, cradled in sweet dreams, and suddenly brought into contact with a living, cold, crowded world; they never pursue the impossible, and ask nothing but from will and intelligence. Those are the weapons that are early sharpened; they believe that intelligence leads to virtue and that will alone attain it."

Speaking of the part women in America play in softening this hard and realistic life, he says:

"Woman appears in the midst of all this like a ray and sunbeam of poetry; so hard to himself, the American always preserves for her a subtle tenderness. She is his equal, his joy, his true companion, the pride of his hearth. They sought each other, and chose freely. She did not come with downcast eyes, mute and timid, but with open hand and raised head. She is his ally and counsellor; the consoler, the inspirer. . . . *With her alone, perhaps in the world, the conjugal is stronger than the maternal love.* Her children have the future, her husband has only her."

The observation we have italicized is both striking and, we think, original. The English translation might fairly claim exemption from criticism, as we believe it is M. Laugel's own; but it is excellent. There are Gallicisms here and there, but they rather in the thought than in the expression.

MR. JOHNSON AS A MAN OF DESTINY.*

Mr. Frank Moore has given us the "life and speeches" of Andrew Johnson, Mr. Savage his "life and public services;" here is a "national man" who undertakes from a "national stand-point" to portray the "life and times" of the same heroic personage. The present biography is neither so concise as Mr. Moore's nor so full as Mr. Savage's, but its deficiencies will fortunately be less apparent now than when it was begun, some eight or ten months ago, when, in the author's opinion, "the public appetite" was "hungry for information" in regard to the President. Fortunately, too, the public has not lost its memory with its appetite, and can easily supply the omissions of the record. It can almost rehearse by heart the famous speech of a *soi-disant* Moses at Nashville, in October, 1864, which appears to have been wholly invisible from a "national stand-point." It can confidently challenge Mr. Johnson himself to repeat his much iterated fulminations against the crime of treason, and the necessity of making it odious by punishment. Not one of these does our observer reproduce, and he only vaguely suggests their existence by apologizing for them to a British reviewer as made in a period of excitement and passion, by one who never pretended to be more than human.

It is well, if possible, to reach the stand-point which shall enable us to see eye to eye with our author. We have discovered it in his assumption concerning the President, that, "from the very necessity of the case, the task devolves on him of having [*sic*] to readjust the component parts of a great empire shaken by the conflict of four years of war." We must not stop to complain that we do not perceive this necessity: that would be to kick away the stand-point at once. Granted that the said burden has fallen of right upon the said man, how shall we be persuaded that Atlas is equal to his load?

This may be effected in a variety of ways. Our author's method is to prove from the past history of Mr. Johnson that he is "the representative man" and "the man of destiny." For such a character a pedigree is desirable, though this, it has been observed, is a matter in which a man ought to be satisfied if he have an honest man for a father. A voucher for Jacob Johnson is not wanting: he was appointed porter of the bank at Raleigh by Col. Polk, who "was shrewd, sagacious, energetic, and industrious. No idler, no spendthrift, no drunkard could have won his confidence or eluded his vigilance." We are then called upon to "contemplate" the successive promotions of the son from the tailor's board to a seat in Congress. The opportunity to enlarge upon the impartial working of our democratic system as evinced in the humble origin of some of its proudest products, is, of course, not neglected. We are next told that the new representative, on engaging for the first time in debate, "managed to get the ear of the House," which, we are assured, is "a fortunate thing for a young member in the delivery of his first speech"—and much more comfortable than to get by the ears with the House. A grandiloquent extract from one of his early speeches is quoted as something admirable in a man who, eighteen years before, could neither read nor write—a defence which might be used by nine out of every ten sophomores in the land; and an argument which would assert Frederick Douglass's capacity to occupy the White House at this juncture a thousand times more forcibly than Andrew Johnson's. Still, the latter's career has been really extraordinary; and though success is not an all-sufficient test of an American messiah, perhaps, if we knew the *rationale* or philosophy of it (as our author is fond of saying), we should at once acknowledge his divine patent and commission. Let us, then, gratefully learn that Mr. Johnson's popularity has been due to his fidelity to the doctrine that "all men are on an equality." This must not be mistaken for "radical agrarianism;" it means merely "that every man, both naturally and under the law, is the equal of every other man, *under similar conditions and circumstances.*" The convenience of this doctrine in the days of slavery is apparent; it may yet suffice to cover injustice to the blacks, if color is a "condition" and a "circumstance."

From another (or is it the same?) "national stand-point," the New York *Herald*, our watchman discerns that President Johnson is no accident, but that he was nominated at Baltimore with special reference to Mr. Lincoln's demise. And if this does not reconcile us to his authority, or incline us to confide in him for the future, we must be brought to confess that "it is a well-established fact in the history of human nature, confirmed by observation in every one's experience, that a man exhibits the same traits of character in every relation of life in which he may be placed." "Any man who loves sincerely the place where his children first saw the light, or who reveres the spot where sleep the ashes of his parents, although he may have infirmities, *he may be trusted.*" "No man ever betrayed his country over whose heart crept a feeling of melancholy tenderness when he thought of the old homestead where he spent the halcyon days of his youth, or whose eyes were involuntarily moistened when recurring to the scenes and events associated with the budding and blooming of his domestic affections." Mr. Johnson, it is well known, has ever cherished a lively affection for North Carolina and Tennessee, and finds already his new home in Washington

* "Life and Times of Andrew Johnson, Seventeenth President of the United States. Written from a National Stand-point by a National Man." New York: D. Appleton & Co, 1866. Pp. 363.

very near and dear to him. Can any one imagine Robert E. Lee or Jefferson Davis looking wistfully towards Arlington Heights or towards a certain bend of the Mississippi? This inflexible President, who, as he himself says, is too old to retrace his steps, and whose future may be so distinctly deduced from his past—can it be said of him as of Governor Johnson, that he can withstand written petitions and the entreaties of friends for the pardon of criminals, and yields only to the tears and sobs of wife, daughter, or mother? This unchangeable Executive—does he still wish, as in 1850, "to see each branch of the government moving in its legitimate sphere?" This tribune of the people—does he still think it an insult, as he did in 1860, for a President to veto a bill which has received the assent of two-thirds of Congress on its first passage? These questions are not discussed from a "national standpoint," whose field of vision was probably too vast to allow their being distinguished. Besides, the author has a simple answer for all our misgivings. "How little," he says, borrowing the language of Napoleon III. in the case of Cæsar and the first Bonaparte—"how little able are common men to judge of the motives which govern great souls."

We dismiss this book with the remark that its spirit is not so detestable as its logic. It is on the whole an absurd attempt to prove that Andrew Johnson is better fitted to legislate in the name of the people than Congress itself. This delusion has its adherents, of whom Mr. Johnson is the most conspicuous, but we do not believe that it is destined to gain ground or to prevail. That our author will by and by discover his mistake we think very likely; but not till he has descended from his look-out among the fogs.

Miss Mulock's Poems. (Boston: Ticknor & Fields. 1866.)—In this book we have the author of "John Halifax" writing poems, and they are evidently the utterance of the same mind and heart which spoke in the novel.

> "The great human caldron—it boils ever higher:
> Some drowning, some sinking; while some, stealing nigher,
> Athirst, come and lean o'er its outermost verges,
> Or touch, as a child's feet touch, timorous, the surges—
> One plunge—lo! more souls swamped in Vanity-fair."

These are verses from a piece entitled "Faithful in Vanity-fair," and for the choice of subject, and the turn of thought, and the sentiment, they seem to us very characteristic of the author. It is, perhaps, considering too curiously, but we fancy, as one gets hints of men's characters by observation of their gait, that even in the movement of the verse, which appears to halt a little and go with a difficult, laborious step, one discerns what manner of person the author really is; that she is not one of the free, joyful spirits to whom poetry is truly the expression of the perception of beauty, but one of those burdened, careful souls whose law is the law of servitude to duty, to whom freedom, unconstrained spontaneity, would be terrifying. In her vocation she is teacher rather than poet; she painfully sows seed and never is purely poetical seeking flowers. When she sings of love it is from the heart she sings, and from a deep heart; but the sentiment is grave and, not without sadness, already is looking forward to cares and responsibilities; it is love in the fear of God, the union of souls to be saved. There is nothing lightsome, intoxicating, perfectly happy in it. Life is to her a time of trial and probation and labor under the great taskmaster's eye. This is a disposition of mind and these are themes which may be rich in what is poetical, and so the readers of Miss Mulock's poems will find. They will find it in the novels however, and, as we think, find that in the novels it gets more adequate expression than when the author chooses verse as the vehicle. For she is not particularly well endowed with the lighter and more superficial gifts and graces of the verse-maker. There is nothing specially fine and admirable in the dress of her thoughts. We copy the lines entitled "An Old Idea," as being a good sample of the author's usua habit of mind, and a good, indeed a very favorable, sample of her s

> "Stream of my life, dull, placid river, flow!
> I have no fear of the engulfing seas!
> Neither I look before me nor behind,
> But, lying mute with wave-dipped hand, float on.
>
> "It was not always so. My brethren, see
> The war-stained, trembling palm. It keeps the sign
> Of youth's mad wrestling with the wars that drift
> Immutably, eternally along.
>
> "I would have had them flow through fields and flowers,
> Giving and taking freshness, perfume, joy;
> It winds through—here. Be silent, O my soul!
> The finger of God's wisdom drew the line.
>
> "So I lean back and look up to the stars,
> And count the ripples circling to the shore,
> And watch the solemn river rolling on
> Until it widens to the open sea."

Asiatic Cholera. By F. A. Burrall, M.D. (William Wood & Co., New York.)—This convenient hand-book purports to be merely a study of the latest evidence concerning the disease now sitting at our gates. The compiler, while intelligently reporting the conclusions of others, is careful not to dogmatize, and the following propositions are the only ones which he endorses, "as sustained by sufficient evidence to justify a belief in them:"

"*First.* Cholera is a disease that is diffused by human intercourse.

"*Second.* The cholera dejections are the chief (if not exclusive) agents in disseminating the infectious material.

"*Third.* Certain circumstances, among which moisture in the soil has a prominent but not exclusive part, favor the spread of the disease."

Dr. Burrall therefore holds that quarantines are useful, especially in countries where the approach of the epidemic can be by sea alone. If there were not respectable physicians who denounce this view, we should say that it was not merely the sensible but the only view to be adopted; and we shall still be of opinion that, had the passengers of the *England*, the *Virginia*, the *Union*, and the *Helvetia* been allowed to disperse at once throughout this city and the country at large, the cholera would now be raging here as it did last summer in Europe. Indeed, that quarantines are not wholly effective is no better reason for abandoning them than for discouraging sanitary observances, which are also not a perfect safeguard against pestilence. Concerning the latter, Dr. Burrall gives the usual information and advice. As a valuable addition to his list of disinfectants, we may mention the ashes of anthracite coal—the plague of the housekeeper in town and in country alike. By mixing these with the contents of his privies, one may procure for himself exemption from noxious gases, and the transmutation of rubbish into a highly superior fertilizer.

Dr. Hartshorne—(*Cholera:* Facts and Conclusions as to its Nature, Prevention, and Treatment. J. B. Lippincott & Co., Philadelphia)—maintains that there is a large class of facts "altogether adverse to the supposition that the cholera is either contagious or in any way dependent for transmission upon human intercourse." He does not believe that the disease is propagated by the discharges of its victims. He scouts quarantine as a preventive of contagion. His theory is:

"That the cause of cholera is a (yet undiscovered) protozoon, or primal organism, of extreme individual minuteness; which, on entering the human body, affects it as an organic poison."

Consequently, the only available measures against the cholera are such as belong to a sanitary police. As for treatment Dr. Hartshorne allows the customary choice.

The Language of Flowers. Edited by Miss Ildrewe. With an introduction from Thomas Miller. Illustrated by colored plates and numerous woodcuts, after Gustave Doré, Daubigny, Timms, and others. (Boston: De Vries, Ibarra & Co., 1866.)—There is good authority, if authority is needed, for saying that the visible forms of nature speak a very various language to nature's various votaries, and there is little to be said when one lover of flowers gives to a particular flower a meaning which to another person seems altogether wrong. It is nearly all arbitrary. The cypress may be said to signify mournfulness naturally, and the violet is fitly an emblem of retiring modesty, and the ivy expresses friendship well enough, though Bacchus used to appropriate it. But, begging Miss Ildrewe's pardon, it seems irrational enough, worse than irrational a tailor would say, to make cabbage signify profit; and is it not a funny reason for making the elder synonymous with compassion that it kindly "furnishes quack doctors with many of their most successful remedies?" As the defenders of capital punishment are fond of saying, This sort of mercy to one criminal may be the greatest cruelty to the whole body of society beside. And is the water-lily called eloquence for the same reason that it is very like awhale—comes up to the surface and blows? There is something cynical in asserting that friendship is typified by the little, ugly, formal arbor-vitæ, which has to be coaxed so much and is so little worth coaxing, which is always green while it lives, and when it ceases to be green dies. Then there is the splendid vermilion pomegranate blossom, it seems not right to connect it with conceit, unless one intends the conceits of the glowing Orientals who delight to sing its praises. And it is a sin of omission in the editor to leave out the lovely trailing arbutus or pilgrim's May-flower. As for the sins of commission, as we said before, this floral lexicography is all a field for fancy, and we can assure our readers that Miss Ildrewe is a very pleasant companion with whom to wander through it. With the sweets of the meadows, and the little green lanes, and the woods, and the glories of the gardens she is lovingly familiar, whether as they grow under the natural sky or as they blossom, almost more beautiful, underneath the new heavens and over the new earth created for us by the poets. The pictures, it is to be confessed, do not keep the promise of the title-page, and this is the more pity, for the book will be in request by young people who wish to make a pretty present.

PARIS GOSSIP.

PARIS, June 1, 1866.

THE approaching Congress of political wiseacres, convened for the purpose of doing what seems very like the work of "piecing two impossibilities together," will necessitate a prolongation of the Legislative session, and thus retard for a few weeks the migration of the gay world towards the sea-side and the German watering-places, which reduces "the metropolis of Europe," during six months of the year, to what, in fashionable parlance, is called "a desert." The Empress has just closed, with a very brilliant *fête*, the series of private entertainments which succeed to the crowded "state balls" given at the Tuileries on the return of the court to the capital; these "private" soirées, to which from five hundred to eight hundred persons only are invited, being the most agreeable things imaginable, in their way. The ladies, being in no danger of finding their finery torn to shreds

as generally happens in the state balls, come out in the most exquisite "toggery" that the combined ingenuities of the toilette-artistes can compass; and as there are always a good many among them who would be beautiful in even the simplest costume, the spectacle afforded by the gathering of fair faces, wonderful dresses, jewels, and flowers, of embroidered uniforms, court-suits, and the orders of all the knighthoods of the world, is extremely brilliant. The Emperor and Empress lay aside much of their ordinary state on these occasions, mingling with their guests, conversing with those who are personally known to them, and taking a leading part in whatever may be going on.

At the last of these pleasant gatherings, which always end with a supper "fit for the gods and the fairies," dresses of various white, transparent tissues were in the ascendant, and were the most admired. The Empress wore a dress of white tulle, trimmed with blue satin ribbons and diamonds, a diadem necklace, and earings of diamonds, torquoises, and opals, and the ribbons and decorations of various royal orders. Princess Metternich was in a white dress, wreathed with ivy-leaves bedewed with diamonds, and a head-dress to match. Beautiful Baronne de Pourtales was in white, trimmed with pink hyacinths; her fair rival, Marquise de Galliffet, also in white, with trimmings of the yellow tea-rose she so specially affects. Many of the prettiest dresses were of transparent tissues, striped or spotted with gold or silver, with coiffures of flowers of corresponding or contrasting colors mixed with tinsel.

The great *artiste*, Sophie Cruvelli, who has not been heard here since her brilliant marriage with Baron Vigier—young, immensely rich, of high character and family, and devotedly attached to her—having consented to sing at two concerts given in this city, a few days ago, in aid of a well-known charity, at the Salle Herz, that pretty little temple of the melodious muse, which professes to hold 500 persons, was crammed to overflowing. The managers had contrived to make no fewer than 800 "reserved" seats, all of which were let, long beforehand, at twenty francs each, and all to ladies; stools for the gentlemen were squeezed in wherever they could be made to stand, and let at ten francs each; the whole of the pretty *salle* was hung with garlands of flowers, the stage included, and lighted with unusual brilliance and taste. The 800 ladies present were all in ball-dresses, their hair, necks, and arms sparkling with jewels, so that, as the gentlemen were also in full dress, the scene was rather that of a ball-room than a concert. The *diva*, in whom the *woman* is admired quite as enthusiastically as the *artiste*, was received with a tempest of applause and an avalanche of bouquets; she looked very well, and sang with all her old fire and perfection, to the immense satisfaction of her friends, who were just a trifle nervous as to the impression she would make after an absence of so many years; but the triumphal success of her recent appearance in aid of a charity-concert, at Cannes, was fully equalled on this occasion. So complete, indeed, was this success that the concert was repeated on the following evening, and with the same brilliant results; the demand for places on each occasion, notwithstanding their high price, being more than double the capacity of the hall. Some little disappointment was felt by those who had hoped to see the great *artiste* in a splendid dress and covered with diamonds, for she appeared in a simple dress of white tulle, trimmed with wreaths of small ivy-leaves, a wreath of the same on her neck and wrists, and ivy-leaves in the dense masses of her magnificent black hair. It is no small proof of the excellence of this lady that her husband's family, who were at first furiously angry at what they considered a disgraceful *mésalliance* on the part of the baron, are now amongst the most devoted of her worshippers, and equally proud of her grace, her virtues, and her talent.

The summer races have opened with the victory of an English horse, *Ceylon*, belonging to the Duke of Beaufort, much to the vexation of the "sportsmen" of France, who, since the triumph of the unrivalled *Gladiateur* on the English turf, had pleasantly made up their minds that the days of humiliation for French horse-flesh were passed for ever. The victory of *Ceylon* was not anything to be particularly proud of; for no first-rate horses ran, even for the "Grand Prize of Paris," of which the late Duke de Morny (who persuaded the Emperor, the Jockey Club, and the Municipality of Paris into establishing the stake in question) used to say that the day which should see these stakes won by a French horse would be one of the proudest of his life. Faint and few were the cheers bestowed on the winning horse; but the Jockey Club, feeling it necessary to reciprocate something of the magnificent hospitalities offered on the other side of the Channel to the fortunate owner of *Gladiateur*, entertained the duke at a banquet given at the classic restaurant of the "Trois Frères Provençaux." The penny-a-liners of the Paris press are endeavoring to console the public under this "disgrace" by reminding them that the Duke of Beaufort is a descendant of the old Norman stock, transplanted into English soil by the summary methods of William the Conqueror. The duke, in reply to the felicitations of his entertainers, assured them that not only he, but the entire race of Englishmen, are delighted with any pretext for coming over to Paris; and expatiated on the brightness of Paris skies, the splendor of Paris thoroughfares, the delightful life and stir and amusement of Paris existence, until his hosts may well have felt themselves consoled for the loss of the palms so easily won by him.

The duke might have added, as another proof of the esteem in which Paris is held by "perfidious Albion," the heavy contributions paid every year by the latter to the admirable gifts of her ancient rival in the spheres of art and artistic industry. The best patrons of French artists are across the Channel. The manufacturers and shopkeepers look to the travelling English, who buy up so large a proportion of their charming temptations, as quite their best customers. A visit to the ateliers of the great sculptor, Baron de Triqueti, in the Rue Pigalle, would tax the equanimity of his English brethren somewhat heavily. The baron is executing for Queen Victoria the great series of Biblical scenes that will cover the interior of the Memorial Chapel which she is building in honor of her late husband. These magnificent compositions are executed in a new style of mosaic, the invention of M. de Triqueti, and are composed partly of lines cut into the white stone, and filled with color, partly of pieces of colored marble inserted into the groundwork. Each great *tableau* is framed, as it were, in a broad border of this beautiful multicolored work, in which green, white, and yellow marbles are thus inserted into the pale chocolate-colored porphyry which forms the groundwork. Besides this fine series, the figures in which are nearly of life-size, and which will form the surface of the interior of the chapel, there will be an immense number of exquisite little bas-reliefs, representing saints, prophets, angels, etc., about a foot high, in white marble, which will be inserted in the angles of the borders of the larger pieces, over doorways and in panels and cornices. When finished, these decorations will rank among the most exquisite creations of the chisel.

It is for this same chapel-interior that Miss Susan Durant, of London, "the Reynolds of sculpture," is executing her wonderful life-size likenesses of the Queen and all the royal children, big and little. The skill and tact with which she contrives to combine the most lifelike fidelity of form and expression with a grace and dignity worthy of classic days, have enabled her to make of this series of portraits at once a faithful record of her royal sitters and a work of the highest value and interest in an artistic point of view. So delighted is the Queen with the portraits of her children already taken that she is having numerous reductions made from them as presents to her friends. Thus, Barbédienne, the well-known manufacturer of artistic bronzes, of the Boulevard Montmartre, has just executed nearly two dozen of these reductions of the Princess Royal and of Princess Helena, in solid gold, the first to be given as mementoes of the baptism of her eldest grandson, the future King of Prussia, the second to be presented as mementoes of the approaching marriage of Princess Helena. All these reductions are set as brooches. The centre forms a medallion, with the head in bas-relief, in dull gold, nearly of the Roman hue. The border to the reductions of the Princess of Prussia is composed of the classic wreath of laurel-leaves, in green enamel, in high relief, the edge of each leaf shown by the faintest *soupçon* of gold; in the centre of the wreath, over the head, is the rose of England, to the left the Scotch thistle, to the right the Irish shamrock, and in the centre, below, the crowned double-headed eagle of Prussia, all in relief and in color. The brooch, thus completed, is slightly oval, and rather larger than a five-shilling piece, and most classical in style and tone—a truly royal-looking ornament. The reductions of Princess Helena are similar in size and general style, but the raised border of enamel encircling the medallion is thickly set with various jewels. Intended for wedding-presents, it is gayer and more brilliant than that of her sister, and forms a magnificent and very beautiful ornament, though less purely classical than that of the Princess Royal.

The Emperor is said to be very desirous of rescuing M. de Lamartine from his harassing pecuniary difficulties, and to have determined on offering to transfer to the state his load of liabilities (amounting to between two and three millions of francs), and to pay to him, from the civil list, an annual pension of forty thousand francs during his life; the poet, on his side, would abandon to the state the copyrights of his works, his patrimonial estates, and his personal property of all kinds. As the whole of the great poet's "belongings" represent but a small portion of his liabilities (the greater part of which, it is but fair to remember, he inherited from his father), this condition is evidently attached to the Imperial offer only with a view to saving the pride of the bankrupt. Whether the latter will accept the offer is, however, somewhat doubtful.

STELLA.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

JEFFERSON DAVIS'S SINCERITY.

DR. CRAVEN, the post surgeon at Fortress Monroe, has fallen a victim to the prevalent mania for book-making, and has produced a full, true, and particular account of Jefferson Davis's behavior since his committal to that stronghold. The doctor informs the world with much earnestness that he has always been a Union man and an anti-slavery man, and that, if his work displays sympathy with the prisoner, it must not be inferred that he has, or has ever had, the smallest sympathy with secession. In other words, like a true Christian, he hates the sin while loving and commiserating the sinner. He also protests strongly that he has in no line committed the smallest violation of professional confidence. Whatever Mr. Davis told him as his medical adviser shall descend with him to the tomb; but everything else about the unfortunate man, his feelings, his fancies, his chagrins, his weaknesses, his opinions, his habits, all the petty acts of his life, from his pulling on his stockings in the morning to the putting out of his candle at night, that a vigilant and minute observer could catch and write down from day to day, may be learned of Dr. Craven for the small sum of a dollar and a quarter. If Mr. Davis is satisfied with the volume nobody else has a right to complain; but if he is, both he and Dr. Craven must at least have the decency not to claim credit for much delicacy of feeling. If the book have any object beyond the turning of an honest penny, and we are bound in courtesy to suppose that it has, it is to excite the sympathy of the public for the prisoner, and prepare the way for general acquiescence either in his pardon or in his acquittal after a sham trial. That it will be partially successful we have no doubt, and that any effort in this direction meets with the highest official approval we have just as little doubt. There have been several indications of late of a sneaking desire on the part of those who have him in custody to turn him loose, if a reasonable pretext could be found for doing so, and it would be difficult to find a better mode of reconciling the country to seeing him back in Mississippi than the publication of such a record of his sufferings and thinkings as Dr. Craven's.

There is nothing in the volume more striking or able or more artful than Mr. Davis's definition of the struggle in which he figured so prominently. He now declares the war to have been merely a rough and painful but inevitable mode of deciding a difference of opinion, honest on both sides, between the North and South as to the structure of the Government, declares that he always so regarded it, and therefore did his best to prevent the infusion of unnecessary bitterness into it. As to the value of this as a statement of facts, we will only say that many of Mr. Davis's speeches during the halcyon days of the Confederacy furnish a strange commentary upon it.

What concerns us most to know is not whether the secessionist leaders were honest in thinking they had the right to secede, but whether they were justified in resorting to arms in assertion of it. This is the real question in all cases of treason. We doubt if treason, in the sense of levying war on an established government, has ever been committed by men who might not fairly claim credit for an honest belief in the justice of their cause. Treasonable attempts on the lives of sovereigns or ministers of state have, of course, as often been made by knavish conspirators as by honest fanatics; but we doubt whether there has ever been a rising in arms, on a considerable scale, for the purpose of overthrowing a government, in which the great body of the insurgents were not thoroughly satisfied that they had God and the right on their side. This has been true of every revolution or attempt at revolution that has ever occurred in Europe. Men in civilized countries are not so fond of disorder and turbulence, do not reck so little of the horrors of civil war, as to take arms in mere wantonness, and imperil their lives and fortunes for the sake of a little excitement. And when our Constitution made treason a crime it undoubtedly contemplated the possibility of large bodies of men becoming dissatisfied with the Government, and attempting to overthrow it for some reason that might seem to them good.

Nobody doubts that Jefferson Davis believed honestly in the right of secession. There was no law against his doing so. There is no law against any man's doing so. Nobody but an Eastern tyrant would seek to prevent a man's holding any theory of the nature of the government he pleases. You may even in St. Petersburg hold the Emperor to be either a despot, a constitutional monarch, a pope, or a usurper; you pay your taxes and choose your own view of the character of those who receive them. Any Hungarian in Austria may consider Francis Joseph merits dethronement, and any legitimist in Paris may be as satisfied as he pleases that Louis Napoleon is a robber, and that Henry V. ought to be on the throne. But in none of these cases would anybody be allowed to enforce his opinions with the sword. It is in this resort to arms that treason consists. There is no moral or legal guilt in holding the Calhoun doctrine of State rights. But there is moral and legal guilt in attempting to put it into practice by force. What Mr. Davis and his fellows ask us to do is to treat everybody who chooses to get up a rebellion, and gives some plausible reason for it, as an honest fellow, only a little mistaken. What would he have said to this plea if put forward on behalf of John Brown? Was *he* not honest? Was not *his* difference of opinion with the charlatan who was then governor of Virginia, and who now flaunts his treason in our faces with perfect impunity, as to the constitution of Southern society, just as sincere as Mr. Davis's on the right of secession? But was that held by Southern lawyers to be any justification of his rising? No society could hold together for ten years which tolerated a doctrine so monstrous. No government is worthy of the name which is compelled to enquire into the motives of those who seek to destroy it before punishing them; and to suppose that the framers of the Constitution, while defining treason, left it to each citizen to decide when his commission of it was justifiable, is to accuse them of having inserted a sorry joke in the most solemn and important state paper in history.

If Jefferson Davis is punished—and we trust he will be—it will be not to gratify any personal hatred for him, but to prevent others like him from ever again trying to put theories of government into practice by force of arms, as long as the press is free and the ballot-box open. It is in having done this that his crime consists. We care nothing about his theories. All we know is that he killed 200,000 men, and covered the land with desolation, in trying to put an end to the Union. He may have been directed to do this in a vision, or may have come to it by reading his Bible; but it is enough for us to know that to admit sincerity as an excuse for it, would place the lives and fortunes of the community at the mercy of its knaves and fools.

There is one other reason which is, in our minds, hardly less cogent. We have filled the whole earth for the last four years with denunciations of the moral guilt of the rebellion. We have dinned into everybody's ears without ceasing that the secessionist leaders were designing knaves, that their crime was the greatest crime and our cause the holiest cause in history. We owe it to our own character, therefore, and to the moral sense of our own people not to let these men go unwhipped of justice. Either the war as conducted by us was a great outrage on human rights, or those who began it deserve some worse fate than defeat—deserve from us some solemn, emphatic, and judicial indication of our estimate of their guilt. We know of nothing that tends more to blunt people's sense of right and wrong, and foster that growing indifference to the moral aspect of offences against the law, which we dignify with the name of good nature, than to hunt men down for four years with prayers, and tears, and execrations, shedding our best blood in our efforts to catch them, for having committed the foulest of offences, and having caught them, to laugh with them over the chase and send them back to their homes. There are people who see something sublime in our horror of crime and in our growing disposition to let criminals go on free. We see in it nothing but an excessive reaction from the blind severity of a past age, the growth of an effeminacy which makes many good men doubt whether a Christian commonwealth be possible.

INSURANCE AGAINST STRIKES.

THERE is no graver problem occupying the public mind just now than how the dispute between labor and capital is to be adjusted. The question is now a perplexed one, owing to the transition state between the old and the new civilization in which we live. Formerly the employers of labor had everything their own way, and now the laborers are trying to have their turn at the dictatorship. In point of fact, there is not, and never was, any real discrepancy between the interests of the two classes, and any tyrannical abuse of power on the part of the masters, of old time, really worked to their disadvantage, just as the attempt of the men to carry impossible points is certain to be damaging to them. Justice is the best possible political economy, and any endeavor, on either side, to set her scales awry will be sure to be punished by a thwack with the flat, if not with the edge, of her sword. We might illustrate this proposition by the problem of reconstructing the system of labor at the South, which is well-nigh as hard to solve, and the solution of which is almost as vital to the general welfare as the political reconstruction itself. But our present business lies nearer home.

The system of trades' unions and other associations of laborers for their own protection have undoubtedly been of material service to those belonging to them, by giving them more correct notions of their rights than their fathers had, and furnishing them with a means of enforcing them. The good they are calculated to perform we rather think they have already done, in raising, reasonably, the rate of wages and limiting, reasonably, the hours of labor. Whatever success they have had, however, has been only as far as they worked in harmony with the eternal laws of political economy, and rectified the existing violations of them. The moment they attempt to repeal or amend these laws in their own interest, these associations become mischievous, only mischievous, and that continually, and to themselves even more than to the employers and the community at large; for the first and heaviest loss falls on themselves. This attempt has just been made here. The efforts to reduce the hours of labor at the pleasure of the laborer, without a corresponding reduction in the rate of wages; to fix the price of labor arbitrarily, and to compel compliance by striking work; to require the same wages to be paid to the bad workman as to the good, to limit the number of apprentices to be permitted to learn trades, and, above all, the execrable tyranny of preventing the willing workman from exercising his right to labor on such terms and for such time as he sees good, all these attempts are in defiance of eternal laws, and must ultimately fail. But the question is how to bring them to an end speedily before they have disorganized labor, demoralized laborers, and established an *imperium in imperio* of the most tyrannical and oppressive kind, only to be overthrown by force of arms; and it is a question on the answer to which the condition of our industry during the next fifty years will largely depend.

How is this to be done? It seems to us that the masters may take a leaf out of the book of the men as to this matter. How is it that strikes are now possible? Because all, or almost all, the operatives above the merest day-laborers belong to a kind of mutual insurance company for the protection of their rights, as they understand them. When a strike is determined on in any trade, in a particular place, the men receive from a fund already on hand, or contributed for the occasion, money enough to enable them to subsist while the strike lasts. This money sometimes comes, as we suppose, from unions of particular trades and sometimes from a general organization including them all. Thus the loss is spread over a wide surface, and, though by no means immaterial to the contributors, can be borne in the hope of carrying their points. Now, what is there to hinder a combination of the employers of labor to counteract this mischievous intermeddling with the laws of demand and supply? An analogous association of large and small capitalists having for its object to make effectual resistance to strikes by dividing the losses among so many as to make the share of each almost inappreciable, on the principle of mutual insurance companies, it seems to us would soon put the matter at rest on its right basis. It is the fact that the operatives have their employers so greatly in their power, by means of their combinations, that gives them the giant's strength which they seem inclined to use so giantly. Relieve the employers from this dependence, and they stand face to face with their men on equal ground to adjust fairly the relations of capital and labor.

For it happens that the pressure of strikes very seldom falls upon the very rich, who can afford to fall back on their reserved capital and wait till the operatives come to their common sense again. If it always did, there would be no need of combination, for large capitalists can generally take excellent care of themselves. The greatest part of the business of the world, requiring the application of capital to labor, is done by master-workmen of very moderate means. The completion of their contracts, of house or ship-building, or printing, or what not, at the time appointed, is not only important to their credit but essential to their livelihood. It is this class of persons on whom the blind tyranny of strike-mongers falls with the greatest severity. They are at the mercy of these laborers, and they often find those mercies cruelties. At the most critical moment of the job the men demand more wages or less work for the same, and the employer often has to comply, to his great loss if not entire ruin. And the employer is often obliged to submit to imperfect or slack work and insolent treatment, because the dismissal of one workman would endanger the stopping of all. Now, such an association as we suggest would meet all such cases. A man projecting a piece of work requiring labor for a space of time, by paying a moderate premium, in proportion to what he expects to make by the job, and agreeing to be liable to a certain further assessment in case of great general necessity, as is done in mutual insurance companies, would be entitled to secure from such an association such a proportion of the profit he expected to make, or the whole of it, as might be originally agreed upon, in case his operations should be interrupted by a strike. The owners of the ship-yards and docks, for instance, who are now the objects of the caulkers' and gravers' strike, would suffer no loss, excepting what they had paid to ensure against it, did such an association now exist; and they could hold out as long as is necessary to bring the men to reason.

Now there may be very grave objections to this plan, but we have been unable to discover them, and do not believe that they can be insuperable ones. The risk is as calculable a one as most of those ensured against, and the losses as readily adjustable. If the capitalists employing labor, and this includes almost all, would unite in such a plan of self-protection and protection of each other, the trades unions for all purposes of mischief would be at an end. For all their beneficent purposes they would be stronger than ever. The only real objection that we can imagine to such an association is the fear that it might give to capital too absolute a control over labor, which might be abused to purposes of oppression. But in this country, where every man has a voice in the State and in the formation of public opinion, such a fear we hold to be absolutely chimerical. The laborer would learn that the due adjustment of his rights with those of the capitalist is as material to his own interest as to that of his employer. He would come to see that there is no antagonism, but the most absolute identity between the interests of capital and labor, and the result would be the most friendly relations between the master and the operative classes and the greatest amount of prosperity to both. And when these relations had been thus adjusted, through the collision of the efforts of both parties to protect themselves, the association would die a natural death for the lack of food to feed on. For this strike of the caulkers and gravers is but the entering edge of the wedge, which will be driven home if some stay cannot be interposed between its cleaving force and the best interests of society.

There is one other means of safety which has been tried very successfully in England, in several cases, and which we wish, most heartily, masters here could be induced to resort to—and that is the plan of dividing all profits over a certain amount amongst the men as a bonus. There is nothing which would so completely and effectually squelch the eight hour movement, and produce real harmony of feeling between employers and employees, as this. It would here, as it has done in England in the few cases in which it has been tried, put an end to waste, and do away with the labor of supervision, as every workman would have the strongest interest in seeing that every other workman did his duty. The real solution of the capital and labor problem is to be found in some form of partnership.

HAS THE NORTH BEEN UNGENEROUS?

THE eloquent pastor of Plymouth Church, in a recent address to his people, said: "The North had a chance to show grace, and love, and magnanimity. How I long to see it! But I have been disappointed. It has not been done."

This charge, from a Northern man of Northern principles, deserves a degree of consideration to which the accusations of our enemies might not be entitled. When Southern writers rave, either in the Richmond *Examiner* or the New York *News*, about the hatred of the radicals towards the South, we know that argument would be wasted upon them, because their object is to perpetuate hatred in the South towards all Northern men and ideas. But when a man like Mr. Beecher expresses his disappointment at the lack of magnanimity in the North, it is necessary to review the past, and see what foundation there is for the charge.

That the North has not come up to the ideal standard of a perfect generosity will, we suppose, be conceded by every one who believes that it ought to have shown generosity at all. The best men and the best societies are far from perfect. Far be it from us to bestow such unseemly flattery upon our countrymen as to assert their perfection in any respect whatever. We have, on the contrary, a keener sense of their faults, and a more earnest desire to make them conscious of their defects, than any enemy can possibly have. But the question now under consideration is one to be determined by a comparison of the North with other nations or persons under similar circumstances, rather than by any absolute moral standard. In *advising* the North, at the close of the rebellion, it was right to urge it to act according to the highest conceivable idea of magnanimity; but in *judging* it, after its course has been taken, it is grossly unjust to criticize it from that exalted and superhuman stand-point.

Now we think that a very simple test may be adopted by which to determine what has been the spirit of the North during the last year. It is not difficult to form an idea of the feelings and conduct of an average man in private life towards an enemy. It is possible to compare the action of various nations and governments toward their enemies with that of private individuals under corresponding circumstances. Making this comparison, we believe it will be admitted that, as a rule, governments have been more severe and unrelenting towards their enemies than individual members of such governments would think it right to be towards their own personal enemies. The instinct of vengeance has seldom been checked at the outset, or been restrained by any other than strictly prudential considerations.

Thus the Irish rebellions, all of them insignificant, and the last one simply ludicrous beside our civil war, were punished with severity—all the earlier ones with profuse bloodshed and even torture. The Sepoy rebellion was punished by inhumanities which the average Englishman would have shrunk from inflicting upon a private enemy. Rebellion in France, Germany, Hungary, Italy, and Poland, has met with terrific punishment, lasting long after all resistance had ceased. According to Mr. Kinglake, 20,000 persons were murdered in Paris alone by the orders of Louis Napoleon, and 400,000 cast into dungeons or transported to Cayenne. Russia and Austria avenged the cause of order by murder and floggings scattered right and left with indiscriminate profusion. Even Switzerland, which, as a republic, could not bear to indulge in these "wholesome severities," compelled its rebellious cantons, if we are correctly informed, to pay the whole expenses of the war waged against them.

What would have been the conduct of the South in the same circumstances? Gov. Wise says frankly, albeit with a devilish spirit, that he would have stripped us naked; if he had been entirely frank, he would have added—and hung us on the nearest trees. The fate of Union men in Texas, Tennessee, and North Carolina, the pens of Andersonville, Florence, and Belle Isle, make the nature of Southern generosity quite clear. Does any man dream that confiscated lands would have been restored, tax sales stopped, and Union men, however penitent, much less if wholly impenitent, have been allowed to vote and hold office in West Virginia and East Tennessee, if they had been surrendered to the Southern Confederacy by a treaty of peace?

Let us imagine a man living on a Western settlement, carrying on a dispute at law with a perverse neighbor. The latter, beaten in every court, makes a desperate attempt to take his adversary's life. He drives him out of his home, burns up his property, kills two or three of his sons, fights long after the struggle both at law and in muscle is clearly decided, doing more mischief after his cause is hopeless than even before, and only yields when deprived of every weapon, and when resistance is simply impossible. How many men, having fought such a fight, and beaten such an enemy, and, we will further suppose, being allowed by law to take his life, or at any rate his property, would say to him, "You may go free. You may have all your property, and I will pay two-thirds of all my costs at law, though I have an execution against you for the whole amount. I forgive you *all* the past, on one condition: your man Cuffee helped me to whip you; you must now treat Cuffee as well as I treat you, and he will help you pay your share of the costs?"

We say that not one man in a hundred would act thus generously, either in America or Europe. Yet this is exactly what the Northern people have done to the South, with substantial unanimity. And if the South would but manifest a general disposition to accept these terms in good faith, the unanimity of the North in offering them would be perfect. Mr. Stevens advocates a different theory, and talks much of confiscation and other punishments. But he has utterly failed to obtain any support for these schemes, even under the present widespread distrust of Southern good faith. If the South should manifest a better spirit, we do not believe that Mr. Stevens himself would continue to advocate any measures of punishment, except as to the foremost leaders of the rebellion; and we are quite certain that if he did, he would not have enough support in the North to secure him a patient hearing. It is the evasion of the South in regard to the claim of right to secede, its evident disposition to repudiate the national debt, its overbearing demeanor, its hatred of Northern men, its persecution of Northern teachers, its outrageous treatment of the colored people, its evident anxiety that Andrew Johnson should play the traitor and call upon it for support, and, in short, its hundred tokens of Punic faith, that chill the springing magnanimity of the North, and make it possible for Mr. Stevens to advocate confiscation and disfranchisement.

The Southern people say, Try us! We *have* tried them. Mr. Johnson's policy has had at least one beneficial result, in showing what the South will do with its regained liberty. It has made it clear that the South values the power of self-government mainly as a means of oppression. Freedmen's codes, making the freedmen mere serfs; constitutions carefully framed so as to exclude Northern men from political influence; Union men excluded from all honor, and treated as lepers; Northern missionaries mobbed and insulted, not in occasional instances, but as the rule; Memphis riots and Louisiana elections; all tell one story of bad faith and malignant temper.

Yet, in spite of all this, the North has just refused to disfranchise rebels; and three-fourths of those who are daily represented as the special foes of the South would gladly restore it to all its privileges on the basis of universal suffrage and universal amnesty. But this proposition is treated by the South as the bitterest wrong of all. It prefers to endure any amount of oppression that the conscience of the North will allow, rather than forego the right of oppressing others. The magnanimity which the North is urged to exercise is the cheap generosity of conciliating its enemies by delivering its humble friends into their hands, bound hand and foot, and ready to be cast into the furnace prepared for them.

A TENNESSEE OLYMPIC.

IF Mr. Burke, when he mourned the departure of the age of chivalry in a celebrated passage the rhetoric of which is worthy of sounder reason, could have foreseen that chivalry would return on the 31st of May, A.D. 1866, to irradiate the State of Tennessee, in the United States of America, the prospect might have mollified the grief of his conservative and apprehensive spirit. We have before us a letter printed in the Louisville *Journal*, full at once of knightly emotion and grammatical solecisms, reciting the splendors of "a tournament" held at Clarksville, Tennessee, as aforesaid, on the day aforesaid, in the course of which seventeen "knights" tilted for crowns and nosegays. One horse died of a bad fall, and one chevalier was "sprained" by falling with him—an aggregate of bloody noses and cracked crowns at

which we fear that Froissart would have turned up his nose and thrown down his immortal pen in contempt. But we must not be hypercritical. If no creature was killed upon this interesting occasion (except the horse) it was arranged beforehand and stipulated that the combats should not be mortal. It was a sort of militia muster, after the fashion of the Middle Ages—a highly refined and romantic kind of sham-fight, bearing about the same relation to the "tournament" which we read of that a modern circus or hippotheatron bears to the Field of Cloth of Gold. The combatants were arrayed not in iron armor but in fancy dresses, some of which, we are told, were "really magnificent," while, as we are further informed, "none were either specious or devoid of neatness." The assumption of character seems to have been a little promiscuous and not without a certain touch of anachronism. If Sir Montgomery Merrit saw fit to appear as "The Black Prince," Sir Henry Herndon was not to be restrained from figuring as "Thaddeus of Warsaw." There was "The Knight of the Fallen Banner," and there was "Sir Walter Raleigh." Mr. Longfellow will be pleased to learn that his "Hiawatha" was impersonated upon the occasion, and stands next in the roll of chivalry to "The Knight of the Silver Moon." But if the costumes were of no age in particular, the speeches—for we defy you to have an American "tournament" or an American any-thing-else without speeches—were decidedly modern, with the true wild raciness of our native eloquence.

After "the fiery horses"—we quote the uncommonly fine language of the correspondent—"after the fiery horses and their proud-crested riders had moved around the circuit two or three times in winsome, all but God-like style"—(God-like style is good, but it would have been better to have used a small "g")—"after they had made their exit through the western gate," they then came back again, and were "disposed in strict observance of military usage in front of the stand" to listen to the speech-making. It was "Gen. Quarles" who "urged them on to the gentle contest in the most inspiriting terms." He said everything which he could reasonably be expected to say to animate, exalt, stimulate, and encourage these fancy warriors. He likened them to "the manly combatants of ancient Greece;" he compared them favorably with "the solid ranks of the Roman legion;" he conjured them to catch courage from the bright eyes of their fair spectators; and he ended by sublimely exclaiming: "On, then, gallant knights! The whole world is impatient to know who will be our sovereign queen hearts and of beauty." The "whole world" may not be much interested to know the name, but for the benefit of the curious few we may state that Miss Molly Boyd was the blushing and beautiful recipient of the royal honors. She received her flowery crown from Gen. Williams, "whose address was replete with everything that the poetry of the moment demanded." The gallant letter-writer affirms that the general "caused the hearts of the young knight and the lovely queen to pulsate hymeneally, and their cheeks to be suffused in blushes." "Ah!" he exclaims, "these ceremonies sent a queer shock to many a surrounding breast." And then came something which they did not have in Athens, nor in Rome—something Bois de Gilbert never enjoyed and the Lady Rowena never presided over—"a rich, rare, and racy barbecue." The knights were hungry—the queen of beauty had an excellent appetite—the king-at-arms was extremely sharp-set—the heralds were as "peckish" as Sancho Panza—"there was more than a sufficiency of edibles, and nobody left the prandial region unsatisfied." Then the knights, internally fortified, went back to the ring "for sober exercise," and "decapitated a manikin." Then the Chevalier Bayard, Rob Roy, Thaddeus of Warsaw, Hiawatha, and the Black Prince trotted horses "for a pair of silver spurs." After this, and to conclude, there was a ball so magnificent that the despairing correspondent informs us that "the picture could never be justly daguerreotyped save upon the tablet of memory." "We have it there fixed," he adds complacently. Happy correspondent!

But our readers have doubtless had enough of what, after all, must have been a sort of shabby-genteel spectacle, as any "tournament" in the year 1866 must necessarily be. This queer aping of knighthood—this droll resuscitation of mouldy forms—this putting on of the rag-tag and bob-tail of romance—the toy lances and the theatrical lists, the sham combats and the poor decapitated manikin—it is all about as genuine as the assumed "chivalry" which sectional vanity with ludicrous complacency laid claim to, and which common-sense soon converted into a nickname. The cotton-growers and the tobacco-planters of South Carolina and Virginia were not in the least like the Crusaders, except in their qualities of character which modern civilization has made discreditable. While they had most of the vices of the old chivalry, they affected, in vain, those minor graces which poetry has assigned to it, and which, if they ever existed, have long been not merely obsolete but extinct. It was impossible to concede a special and superior refinement to a society in which personal revenge, while cultivated as a virtue, was continually resorting to the rude remedy of assassination, to the butcherly methods of gladiators and the skulking ambush of the Corsican vendetta. It was hard to believe those households peculiarly and admirably polished in which the lash was the constant and recognized instrument of domestic discipline. It was imposing a vast tax upon our credulity to ask us to admit a more than usually delicate sense of justice in those who defrauded the laborer of his daily hire, or a peculiarly romantic gallantry in others who smote shrinking womanhood with a heavy hand and were deaf to the despairing cries of bereaved maternity. Shocked out of a judicial equanimity by the contemplation of shame and crimes like these, it is probable that we have overlooked whatever may be really excellent in the Southern character, and have failed to do justice to qualities admirable in themselves and easily allowed when not overshadowed by prevailing vices. It must be admitted, we fear, that the love of woman which chivalry animated and fostered was of a coarse and sensual character, and that the gallant knight thought of his "ladye love" as a toy for his amusement, and not as an equal, a friend, and a companion. How far "modern chivalry" has thus retrograded towards barbarism we need not here enquire. It is pleasanter to believe and to avow our belief that a social condition awaits the South in which there will not be so much tournament talk of love and of beauty, but a nobler recognition of all that is comely and lovely in the character of woman.

THE PARLIAMENTARY PRIVILEGE OF BATTERY.

THE great apologist of the Quakers might not find it hard, but, as men go, any other man than Barclay would not find it easy to visit Mr. Rousseau's recent folly with unqualified condemnation. The typical Kentuckian, Kentuckians like to believe, strikes back if he is struck by lightning, and is so far from holding the suave philosophy that no respectable person will, and no other can, insult him, that with noble eagerness he snuffs an affront afar off, and, like the costermonger's donkey, the Kentuckian's honor may be said to keep cultivated raws all ready with inflamed tenderness for any and every blow. Even the exceeding stature which we have heard so much about the Kentuckian brags of, shall we not believe, as that mighty boaster Tamburlaine the Great is feigned to have bragged of his, eminent because of the lofty soul within. Not on mere pounds avoirdupois, nor on dollars did the whiskey-distilling branch of our Southern aristocracy base its claim to admiring deference, but on its notorious delicacy and greatness of soul. The body, with its extremities small and shapely, as Dr. Bellows, for the sake of peace and conciliation, was willing to admit, might be as straightly fashioned and as robust as Mrs. Caroline Lee Hentz could be fond of believing it, but the mounting spirit of the true Kentuckian, delicately susceptible, opposes the seven-shooter to the ferule of the insolent schoolmaster, and if but roughly breathed upon demands a shot at twelve paces, or to be allowed a knife and a fair show in a bar-room, or to be shut up with its injurious enemy in a locked room all alone with two double-barrelled guns, with twelve buckshot in each barrel, and by the sympathizing public sentiment of the Dark and Bloody Ground it usually had its claim allowed.

But leaving out of view the perhaps extreme opinion in regard to the cheap defense of notions which is understood to be prevalent in Kentucky, the late assault and battery on Mr. Grinnell by his fellow representative opens two or three interesting questions. How much abuse does society require a man to bear without unchristian resentment? Should a very excessively elastic privilege of debate be suffered to protect scurrility in Congress which would never find utterance in the street unless the speaker was prepared for a stout fight? Is not the House debarred from expelling Rousseau for his acts of Wednesday by its tolerance of the words of Grinnell and Rousseau on Monday? In answering these questions it is, of course, to be borne in mind that this is the year eighteen hundred and sixty-six of the Christian era; but we must remember also that, as a fact, it is still not uncommon for men—other men than Kentuckians—to resort to violent measures of redress when publicly bawled at as liars, and brainless fools, and sneaking cowards pretending to rewards and glory for their courage.

Mr. Boswell says he thought it rather a superfluity of refinement in the society of his day that it strictly required an affronted gentleman to resent it at once at the risk of killing or being killed with the duelling pistol or small sword. Yet that the requirement was made he by no means denied, nor did the great moralist with whom he and General Oglethorpe were talking deny the assertion or the conclusion which was drawn, namely, that a man might properly fight a duel provided he were not the aggressor. That was in 1770 or thereabouts, and the world since then has changed sides, now not giving its acquiescence, much less its command, to the duellist, but prosecuting him for murder, and laughing at him for a fool. But a

the same time that it has taken away from the insulted the right to get himself redress, it has made insults less common, and it more strongly discountenances him who gives them. Otherwise, we should be compelled to say that society had removed a safeguard of the comfort and happiness of the weak and set up nothing in its place. When Congress does its duty in this respect, when it puts an end to or even frowns upon the insolence, folly, and blackguardism with which its dignity is every day insulted and the country disgraced, then it may with better grace talk of expelling a member who commits an assault on a man who scurrilously slanders him. Meantime we hope both offenders in the latest breach of decorum may be speedily and equally punished. To hope that the House will reform altogether its manner of debate is probably to hope too much.

HISTORY OF WEST POINT

AND ITS MILITARY IMPORTANCE DURING THE AMERICAN REVOLUTION,

AND THE ORIGIN AND PROGRESS OF THE

United States Military Academy.

BY CAPTAIN EDWARD C. BOYNTON, A.M.,

Adjutant of the Military Academy.

ILLUSTRATED WITH NUMEROUS MAPS AND ENGRAVINGS.

1 vol. octavo; Blue Cloth, $6; Half Calf, $7 50; Full Morocco, $10.

"Aside from its value as an historical record, the volume under notice is an entertaining guide-book to the Military Academy and its surroundings. We have full details of cadet life, from the day of entrance to that of graduation, together with descriptions of the buildings, grounds, and monuments. To the multitude of those who have enjoyed at West Point the combined attractions, this book will give, in its descriptive and illustrated portion, especial pleasure."—*New York Evening Post.*

D. VAN NOSTRAND, Publisher,

192 Broadway.

A BOOK FOR THE SEASON.

THE LANGUAGE OF FLOWERS.

Edited by Miss ILDREWE.

With an Introduction from THOMAS MILLER.

Illustrated by Colored Plates, and Numerous Wood-cuts, after GUSTAVE DORE, DAUBIGNY, TIMMS, AND OTHERS.

Boston: DE VRIES, IBARRA & COMPANY.

New York: LEYPOLDT & HOLT,

451 Broome Street.

FINANCIAL REVIEW.

NATION OFFICE, Monday, June 18, 1866.

THE news from Europe, intimating that the European Congress has been abandoned, and that troops have already been set in motion for the Austrian frontier, has exercised an important influence upon our markets. Gold and produce have gone up, and much uneasiness prevails in foreign banking circles. Private letters from London state that the feeling on the Stock Exchange was better than it had been, and that American securities were in improved demand. Still the enquiry for 5-20s, Erie, and Illinois must have been chiefly for export to this country. It is gratifying to note that no failures of consequence have occurred in connection with this country, and that the assistance rendered by us to the London banks and merchants is fully acknowledged. A prominent London house states that American credit never before stood as high as it does at present in England. It is probable that, before our next number is issued, we shall hear of the actual clash of arms; from that point, financial recovery will probably begin.

Money continues very cheap. Call loans are quoted at 5 and 6 per cent., and first-class short paper 6 and 7. The national banks, unwarned by experience, continue to expand to the limit of their means, and cliques in merchandise and stocks find no difficulty in obtaining all the money they require to carry their property. Government securities of all kinds are being accumulated in the hands of national banks. The Government deposits in these institutions must be over sixty millions at the present time.

Stocks continue animated. Five-twenties have risen on the advance in gold, and all the parcels arriving from Europe are eagerly taken at the improvement. Seven-thirties and 10-40s are firm and in request. Among the railway stocks the movement has been irregular. The New York Central clique has again pushed up the price to the neighborhood of par; they will probably again endeavor to sell by making the stock scarce. Erie has fallen back, partly on the growing conviction that dividends are a thing of the past and partly on the arrival of considerable amounts of stock from abroad. The traffic report for May shows a decline of $323,000. Reading is steady; no dividend has yet been declared, but the tonnage for the season shows an increase over last year of 500,000 tons. There is no change in Michigan Southern, and no indication of the long-promised summer dividend. Pittsburgh continued to droop, on efforts by the clique to sell out, till this morning when it rallied to 84¼. Rock Island was run up by the clique which holds it to 94, but has since fallen back. The volume of stock which is waiting to be sold at or about 94 to 95 is very large. The North-western stocks are lower again; the party which undertook to bull them appears to have lost heart. Among the miscellaneous fancies there is no traffic except among the promoters themselves. The public have been too often burnt to be easily tempted to purchase stocks of unknown value simply on the vague theory that they "are going up." Canton is, perhaps, the only exception to the rule, and really looks very firm indeed.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	June 11.	June 14.	June 18.	Advance.	Decline.
United States Sixes of 1881	105¾	106	106	....	....
5-20 Bonds, old	102¼	102¾	103¾	1⅛	....
5-20 Bonds of 1865	102¼	102¾	103	¾	....
10-40 Bonds	96⅛	96¼	96⅜	¼	...
7.30 Notes, second series	102⅜	102⅜	102⅛	⅛	....
New York Central	97¼	98¼	99¼	1	....
Erie Railway	62⅛	59⅜	59⅛	....	....
Hudson River	109⅜	110	110¼	¼	....
Reading Railroad	109¼	109¼	109¼	....	....
Michigan Southern	79½	79	78¾	....	¼
Cleveland and Pittsburgh	83⅜	82¼	83¾	1⅜	....
Chicago and North-western	30¾	30⅜	30	....	⅜
Chicago & North-Western, Preferred	60⅜	59¾	59	....	¾
Chicago and Rock Island	92⅛	91⅛	93¾	2¼	....
P., Fort Wayne, and Chicago	96	97¼	97	....	¼
Canton	59¼	58⅜	60¼	1⅛	....
Cumberland	44⅜	45	44⅜	....	⅛
Mariposa	11⅜	11⅜	11¼	....	⅛
American Gold	139⅜	147⅛	158	10¼	....
Bankers' Bills on London	109⅞	109⅞	108	....	1⅞
Call Loans	6	6	6	....	....

Gold rose this morning to 170, afterwards fell back to 155, and at the present time, 4 P.M., is 158. Exchange has declined to 108 for prime bankers' bills. The advance in gold has created much alarm in commercial circles, and the conduct of the Government officials in throwing away thirty millions at 130 is the subject of severe criticism. At the present time the whole specie reserve in the banks is so small that a few speculators might readily lock it all up, and compel the shorts to pay any price they pleased. The Government is powerless to resist a corner; it cannot afford to sell any amount sufficient to frighten the bulls; and until the new cotton crop comes in we shall have nothing to export but bullion. The rise in the premium has naturally led to a corresponding advance in produce, but it is quite doubtful whether the country contains any surplus of food, and thus the advance is merely an additional burden upon consumers. It may check the importation of U. S. bonds from Germany; for with gold at 160 but few foreign holders could afford to sell except at a loss. But, on the other hand, the miserable mismanagement of our finances and the consequent advance in gold will not assist our credit abroad, and many bondholders, discouraged and disgusted, may send their bonds home for sale at any price. Had Congress and the Treasury Department pursued a statesmanlike course, gold would not have been above 125 at the present time, the currency would have been in process of curtailment day by day and week by week, the consumption of foreign goods would have been comparatively small, and the Government and not the speculators would have been master of the situation. As it is, Congress sets its face against the only measure which could help the public finances—the curtailment of the currency; and the Secretary of the Treasury, after proving in the most conclusive manner that nothing but contraction could save us, has ever since, by his acts, promoted expansion. We confess that we see no indications of a return to sound principles at either end of Pennsylvania Avenue. In Congress an increase of the national currency is mooted, and from the Treasury Department manifestoes appear periodically which are calculated to encourage an expansion of national bank credits. Perhaps it would be as well—as it seems we cannot help ourselves—to let the paper-money men have their way. The vaster the expansion now, the more quickly will come the collapse. Mr. Sherman and Mr. Stevens will not tolerate the reduction of a currency which is at least thrice as abundant as it should be. Well, let them have their way. Let us have, if we cannot prevent it, a hundred millions more national bank currency. Let the public money continue to be loaned free of interest to national banks ("pet banks"), and let these institutions be encouraged to expand as widely as possible. Let us see how far the paper-money men will carry their doctrines. If a thousand millions of irredeemable paper money will not do, let us have two thousand. If gold at 160 will not bring Congress to its senses, let us wait till it is 260. That it will go there, if the present policy of the Government be continued, there can be no manner of doubt. Meanwhile we most earnestly advise every one to beware of the future—to beware especially of the new national banks; not to hold their notes or to deposit money with them or to hold stock in them. And should Congress persevere in the policy which it has thus far pursued, it may well be questioned whether investments in U. S. securities can be safely recommended. No nation can preserve its credit if its finances are as grossly mismanaged as ours have been of late. If paper-money expansions and a reckless squandering of the public resources continue to be the rule, United States securities will fall heavily, and persons who have invested their means in them will be ruined. With good financial management at Washington, they are the best security in the world; but there is no property so good that it cannot be ruined by mismanagement.

THE

NATIONAL LIFE INSURANCE COMPANY

OF

NEW YORK,

212 BROADWAY, CORNER OF FULTON STREET

(*KNOX BUILDING*).

EDWARD A. JONES, President,

WM. E. PRINCE, Vice-President,

JONATHAN O. HALSEY, Secretary.

HIRAM B. WHITE, MEDICAL EXAMINER,

Residence, 5 Green Avenue, near Fulton Avenue, Brooklyn.

At office daily from 2 to 3 o'clock P.M.

FIRST CLASS FIRE INSURANCE

ON THE PARTICIPATION PLAN.

MARKET FIRE INSURANCE COMPANY,

37 WALL STREET, CORNER OF JAUNCEY COURT.

CONDITION OF THE COMPANY.

ABSTRACT OF THE ANNUAL REPORT OF DEC. 31, 1864.

TOTAL ASSETS		$414,729 18
Viz.—Bonds and Mortgages	$134,672 00	
Temporary Loans	92,630 00	
Real Estate	10,000 00	
100 Shares Mer. Ex. Bank	5,000 00	
Government Sec., value	144,514 00	
Cash on hand	18,042 34	
Interest due	3,085 58	
Premiums due	6,785 26	
PRESENT LIABILITIES	$15,995	
NET SURPLUS	198,733 26	

This Company will continue, as heretofore, to insure respectable parties against DISASTER BY FIRE

At fair and remunerating rates; extending, according to the terms on its Policies, the advantage of the

PARTICIPATION PLAN OF THE COMPANY,

pursued by it for several years past, with such great success and popularity, and profit to its customers: whereby

(75) SEVENTY-FIVE PER CENT. (75)

of the Profits, instead of being withdrawn from the Company in Dividends to Stockholders, is invested as a "SCRIP FUND," and held for greater protection of its Policyholders; and Scrip, bearing interest, is issued to Customers therefor: thus, IN THIS COMPANY, those who furnish the business, AND PAY THE PREMIUMS, derive the largest share of advantages; and when the accumulations of the SCRIP FUND shall exceed

FIVE HUNDRED THOUSAND DOLLARS,

the excess will be applied to PAY OFF the Scrip IN CASH in the order of its issue.

☞ The liberal and prompt adjustment of Claims for Loss, WHEN FAIR AND SQUARE, is a specialty with this Company.

NOTE.—This Company does not insure on the hazards of RIVER, LAKE, or INLAND NAVIGATION; confining itself strictly to a legitimate FIRE INSURANCE BUSINESS.

ASHER TAYLOR, President.

H. P. FREEMAN, Secretary.

DIVIDEND paid during the present fiscal year	69,160
TOTAL DIVIDENDS paid	419,000
TOTAL LOSSES paid	944,042

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

THE NATION.

THE NATION has now outlived a great deal of misunderstanding. Whether they think it good, bad, or indifferent, most people know what it is aiming at, and are able to state pretty clearly why they like or dislike it. We have received such assurances of the interest and satisfaction with which our enterprise is viewed as convince us that we have at least acquired what must form the basis of all permanent success for any such paper as this aims to be—the good opinion and good wishes of those who know best what good writing, clear thinking, and sound criticism are, and to whom the country owes not only the larger part, but the better part, of its fame.

For the guidance of those who may feel disposed to assist us with their contributions, we may mention that the contents of THE NATION will fall nearly under four divisions—or that, at all events, these divisions would have to be kept in mind by anybody writing for it as a volunteer.

1. References to, and concise comments on, the news of the day, with the view of fixing the degree of its importance, and suggesting its bearings upon and relation to the main current of contemporary history.

2. Reviews or comments, whether in the shape of letters or articles upon important events, and upon the utterances of those who are, or are trying to be, leaders of public opinion.

3. Accounts more or less detailed, or discussions of such occurrences in the social, literary, artistic, or scientific world as are likely to interest men or women of education and intelligence. Under this head we do not include mere gossip about nobodies, or advertising chronicles of the sayings and doings of quacks, daubs; penny-a-liners, dilettanti.

4. Critiques of publications or works of art of sufficient merit to make it desirable that the public should ever hear anything about them.

TERMS—$5 per annum; 6 months, $3.

When delivered by Carriers in New York or Brooklyn, $1 additional.

WM. B. BRADBURY.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not detracting in the slightest degree from its many positive advantages, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fulness, prolongation, and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

Saleratus.—B. T. BABBITT'S SALERATUS, 70 Washington Street, N. Y. If you want healthy bread, use B. T. Babbitt's best medicinal Saleratus, made from common salt. Bread made with this Saleratus contains, when baked, nothing but common salt, water, and flour. B. T. BABBITT, 64, 65, 66, 67, 68, 69, 70, 72, and 74 Washington Street, N. Y.

Send for a descriptive Circular.

Make Your Own Soap with B. T. BABBITT'S Potash, in tin cans, 70 Washington Street, New York. Pure Concentrated Potash or Ready Soap Maker. Warranted double the strength of common Potash, and superior to any other saponifier or lye in the market. Put up in cans of one pound, two pounds, three pounds, six pounds, and twelve pounds, with full directions in English and German for making Hard and Soft Soap. One pound will make fifteen gallons of Soft Soap. No lime is required. Consumers will find this the cheapest Potash in market.

B. T. BABBITT,

64, 65, 66, 67, 68, 69, 70, 72, and 74 Washington St., N. Y.

PURELY MUTUAL LIFE INSURANCE.

New York Life Insurance Co.

ESTABLISHED 1845.

HOME OFFICE, 112 AND 114 BROADWAY, N. Y.

Assets, over $5,000,000,

SECURELY INVESTED.

This is one of the OLDEST, SAFEST, and most SUCCESSFUL life insurance companies in the United States, and offers advantages not excelled and, in some respects, not equalled by any other. It has paid to widows and orphans of the assured THREE MILLION FIVE HUNDRED THOUSAND DOLLARS. Its Trustees in New York City are of the very first and most reliable names.

It is STRICTLY MUTUAL, the policy holders receiving the entire profits.

Premiums received QUARTERLY, SEMI-ANNUALLY, or ANNUALLY, at the option of the assured. Policies issued in all the various forms of WHOLE LIFE, SHORT TERM, ENDOWMENT, ANNUITY, etc.

DIVIDENDS DECLARED ANNUALLY (for 1864 and 1865, each 50 per cent.)

The mortality among its members has been proportionately less than that of any other life insurance company in America—a result consequent on a most careful and judicious selection of lives, and one of great importance to policy-holders.

It offers to the assured the most abundant security in a large accumulated fund, amounting now to over

FIVE MILLIONS OF DOLLARS.

It accommodates its members in the settlement of their premiums, by granting, when desired, a credit at once on account of future dividends, thus furnishing insurance for nearly double the amount for about the same cash payment as is required in an "all cash company."

The annual income, exclusive of interest on investments, now exceeds

Two and a Half Million Dollars.

The following is a summary of the Company's business for the year 1865:

Number of Policies issued,	5,138
Insuring the sum of	$16,324,888
Received for Premiums and Interest,	$2,342,820 40
Losses, Expenses, and Dividends paid,	1,118,901 25
Balance in favor of Policy-Holders,	$1,223,919 15
Total Assets, January 1, 1865,	$4,881,919 70

THE NEW YORK LIFE INSURANCE CO.

Originated and introduced the *New Feature*, known as

THE NON-FORFEITURE PLAN,

which is rapidly superseding the old system of life-long payments, and has revolutionized the system of Life Insurance in the United States. It has received the unqualified approval of the best business men in the land, large numbers of whom have taken out policies under it, purely as an investment.

A new schedule of rates has been adopted, under which the insurer may cease paying at any time without forfeiture of past payments; and at the

END OF TEN YEARS ALL PAYMENTS CEASE ENTIRELY,

and the policy thenceforward becomes a source of income to him. To secure this result the annual rate of insurance must, of course, be somewhat higher. But almost any person in active business would greatly prefer paying a higher rate for a limited time, and be done with it, to incurring a life-long obligation, however small.

By the table on which this class of policies is based, a person incurs no risk in taking out a policy. Insuring today for $5,000, if he dies to-morrow the $5,000 immediately becomes a claim; and if he lives ten years, and makes ten annual payments, his policy is paid up—nothing more to pay, and still his dividends *continue*, making

HIS LIFE POLICY

A SOURCE OF INCOME TO HIM WHILE LIVING.

The only weighty argument offered against Life Insurance is, that a party might pay in for a number of years, and then, by inadvertence, inability, etc., be unable to continue paying, thereby losing all he had paid. The "New York Life" have obviated this objection by their

TEN YEAR NON-FORFEITURE PLAN.

A party, by this table, after the second year, cannot forfeit any part of what has been paid in.

☞ This feature, among others, has given to this Company a success unparalleled in the history of Life Insurance.

A credit or advance of twenty per cent. on account of dividends is given on this table if desired, at the current New York rate of interest.

☞ There has been paid to the widows and orphans o members of this Company an aggregate sum exceeding **$3,500,000.**

☞ The dividends paid (return premiums) exceed **$1,700,000.**

Parties applying for Policies, or desirous of connecting themselves with the Company as Agents, will please address the Home Office either personally or by letter.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

Topics of the Day.

THE cholera begins to figure in the weekly bills of mortality. For the week ending Saturday, the 16th instant, six deaths by that disease are reported. For the week ending Saturday, the 23d, the number will probably be greater. One new case is said to have occurred within the city on Monday, two on Tuesday, and on Wednesday there were four. There is no panic, however, and the butchers in particular are not dismayed by the worst prospect which may be before us. Having heard that the Board of Health had made up its mind to abate the slaughter-house nuisance, and make them ply their vocation away from the crowded quarters of New York and Brooklyn, they held a meeting to express their disgust at such an outrage, and to declare that they will not budge. There was no reason, one speaker asserted, why the slaughter-houses should be moved. The board appeared to think that "a butcher was not fit to live in a civilized community." But this butcher spoke a little bit too long, for by and by he enquired if the board thought the people of Harlem and other country places ought to be compelled to endure the slaughter-houses. He proposed that the board should banish all the butchers to a desolate island, and erect a monument in the middle of the butchers' settlement with this inscription upon it: "Here, by special permission of the Board of Health, live the butchers of New York, a proscribed race." To avert such a fate the assemblage voted to fight the board in the courts, and pledged themselves to raise $10,000 for that purpose.

THE bill establishing a Bureau of Education has passed the House, and it may or may not pass the Senate in these last days of the session. It is not contemplated to set up a central power which shall have any authority to supervise, or in any way interfere with, the local educational institutions of the States. It will be the business of the head of the department and his three clerks to collect statistics and disseminate information, with a view of showing and of encouraging the progress of education among the people of the United States. A report is to be made annually to Congress, and therefore we suppose the $9,400, which is to be expended in salaries, may be tolerably well earned.

IN the debate on the appropriation for the Paris Exhibition, on Wednesday, Mr. Banks did excellent service in opposing several foolish attempts to get rid of it. Mr. Washburn, for instance, wanted to add a proviso that the bill should not take effect until the French troops had been withdrawn from Mexico—a mode of punishing the French for their interference about on a par with Mr. Ancona's proposition to punish the British by repealing the neutrality laws for the benefit of the Fenians. As Mr. Banks very properly observed, a great country owes it to its own dignity to do things in a straightforward way. If we desire the French to leave Mexico we ought to say so, and if we are in earnest, ought to force them to leave it with the army and navy of the United States. The plan of bringing foreign enemies to reason by not sending goods to their exhibitions, or letting bands of brigands go over the border to harry them, is very like following an enemy in private life with a syringe, and squirting a little water on him now and then, which would be a very annoying process to the enemy, no doubt, but what should we think of the squirter? There are some men in Congress who never can see in international difficulties anything more imposing than a squabble at a corner grocery of a Western village.

THE tarifi bill as reported by the Senate Committee exhibits a pretty general tendency to lower taxes and raise salaries. The latter we consider as laudable, and almost as desirable as the former. The low rate at which United States officials are paid is one of the most potent causes of corruption and inefficiency, and nobody who is of much value for business purposes fails in this country to find his place at high wages in the business world; so that the Government is in the main apt to get for its subordinate officers only the dregs of the labor market. Even the dregs of the labor market, however, have to eat, drink, and be clothed, or if you underpay them, will filch, steal, or idle.

IF Judge Busteed, of Mobile, can get a grand jury of his own mind trials for treason need never fail in the United States Circuit Court for the Southern District of Alabama. In his charge at the opening of the session the judge defined treason, specified the sort of evidence required to prove it, and showed that, under the Constitution, words alone could not constitute the crime. But, he went on to say, if a man has committed treason once and obtained a pardon therefor, and taken the necessary oath, and then, like an ingrate, breaks his oath, he is remitted to his original state of guilt and is a malefactor deserving the punishment of treason, perjury, and ingratitude. And does a man, the judge asks, keep his oath to faithfully support the Constitution of the United States, and the Union of the States thereunder, whose every word concerning either is one of abuse and detraction? The grand jury are requested to take notice of the speech of these oath-takers, and to remember their own oaths. These are good sentiments, but we rather doubt its being good law, and certainly it will not be in force during the present sitting of the grand jury in Mobile.

THERE is considerable calm amongst the Fenians, and it is said a new plan of operations has been drawn up, in which secrecy is to play a prominent part. The enemy and the police are not to know everything in future. This is not by any means a bad idea, but we doubt very much whether, if carried out, it will not cause a considerable falling off in the receipts. Under the old plan the contributors saw, in

the hubbub and publicity, some return for their money; but if the dollars were to glide away and nothing were to be seen of them or their results, until at some remote and undetermined day the Fenian thwacks were to be heard on the ribs of the British lion, we fear the enthusiasm would flag. There is much hope entertained of the action of Congress, but we doubt if there will be any better comfort derived from this quarter than may be found in Mr. Banks's report, which will probably be very able and wordy, and leave everything just where it found it.

In Linn County, Iowa, on the 10th of April last, nine persons out of a family of ten were suddenly attacked by a new and singular disease. The symptoms at first were violent and gradually assumed a milder form, but they were such as to puzzle the family physician. As the disease bore a general resemblance to typhoid fever, the treatment applied to the patients was the treatment suitable for that disease. At the end of twenty days two doctors were called in to consult with the doctor in charge, and it was decided that the family had eaten trichinous meat. Not long afterwards three of the patients died, and a *post mortem* examination was made. Trichinæ were discovered. Portions of the muscular tissue were sent to many surgeons and scientific men, who are said to have confirmed the conclusions of the local doctors, and to have stated that the average number of worms found in the various pieces of flesh submitted to them was two hundred thousand to the cubic inch. Three more of the unfortunate family have since died, and it is well ascertained that they had all eaten of diseased pork—ham which had not been cooked at all. This seems to be about the first perfectly authenticated case of trichiniasis which has occurred in this country.

The only decisive news concerning the European war is, that Prussia, true to her whole line of behavior hitherto, has taken the first step towards a collision. On the 8th her troops crossed over into Holstein and occupied Rendsburg, the Austrian commander evacuating peaceably but under protest, and retiring as far as he conveniently could without leaving the territory altogether—that is, to Altona. The Prussian general, Manteuffel, announced the abrogation of the treaty of Gastein, owing to Austria's failure to keep her part of it. His advance purports to be only a return to the *status quo*, or a joint occupation of the duchies, and in pure defence of the rights of his sovereign. Bismark has sent a bitter and sufficiently contemptuous circular to the Prussian representatives abroad, in which he accuses Austria of making war "to tide over domestic difficulties," and to assist her finances "by Prussian contributions or by honorable bankruptcy." Gen. Benedek, remembering, perhaps, the experience of this country in the late war, has announced his resolution "in no way to tolerate, either at headquarters or with other commanders or corps, paid or unpaid newspaper correspondents, either civil or military," unless when authorized by the Government.

The Emperor of Austria and the King of Prussia have both signified their intention of respecting private property at sea in the coming war. As neither of them possesses navy enough to do anybody much harm, the sacrifice is not as great as it seems, but it is, nevertheless, unquestionably an indication, and a valuable one, of the advance of civilization. There is nothing, even in the absurdity of war, more absurd than the practice of destroying the ships of private persons, by way of bringing the government to terms. It has never had any such effect. Ship-owners are, even in maratime countries, a small class; the mass of the community are very little affected by their troubles; as was shown in our own war, and the most important result of what is called "the destruction of an enemy's commerce," is the transfer of the carrying trade to some other power. There is sometimes a touch of the comic lent to the matter by the indignation of those whose property is all on shore, when ship-owners show too great a reluctance to have their vessels burned. Congress treated those amongst American ship-owners who made transfers of their ships to a foreign flag, to escape Semmes, as if they were little better than traitors.

CONGRESS.

WASHINGTON, June 20, 1866.

The bill of the Select Committee on a National Bureau of Education has at length got through the House by an unexpectedly large majority. Its defeat on the first trial was owing more to the absence of many of its friends than to any other cause, though it may be said that the spokesmen in its favor failed to show any close relation between their professed objects and the means proposed in this special measure. How much a "central directory" of educational statistics, consisting simply of a commissioner and three clerks, with no specific powers conferred upon them, will accomplish toward a uniform national or liberal system of education will remain to be seen, provided the Senate and the President lend their sanction to the measure.

The new army bill reported in the House will probably pass, though it is actively antagonized with that which has already passed the Senate. It is noticeable in this army organization business, as in some other departments of affairs, that men are pragmatical in the inverse ratio of the importance of the differences which divide them.

DIARY.

Monday, June 18.—In the Senate, the internal revenue tax bill which passed the House was reported with amendments. The bill to regulate the occupation of mineral lands was discussed and amended.

In the House, a joint resolution to pay the State of Vermont her expenses in defending the frontier against rebel invasion from Canada in 1864 was passed. Mr. Stevens offered a joint resolution proposing a constitutional amendment to empower Congress to lay an export duty upon cotton. Rejected—yeas, 59; nays, 61. A concurrent resolution requesting the President to transmit forthwith to the executives of the States the constitutional amendment lately proposed by two-thirds of both Houses of Congress was passed—yeas, 92; nays, 25. Mr. Raymond made a speech on reconstruction.

June 19.—In the Senate, the bill granting lands to aid in constructing a railroad from Salt Lake City to Columbia River was passed. The army appropriation bill was amended by the addition of about $7,000,000 for the support of the Freedmen's Bureau for the coming fiscal year, and passed. The bill amendatory of the Pacific Railroad act of July 2, 1864, was passed—yeas, 20; nays, 12. House bill to pay Vermont's expenditures in protecting her frontier in 1864 was passed.

In the House, the bill to establish a national bureau of education came up on a motion to reconsider its rejection last week by the House, and the bill was passed—yeas, 80; nays, 44. The new bill to reorganize and establish the army of the United States was discussed and amended.

THE FREEDMEN.

The Baltimore Association for the Moral and Educational Improvement of the Colored People is, so far as we know, the only organization of the kind among the white citizens of the lately slaveholding States. But for its untiring exertions, the indifference or prejudice of the authorities and the public would have kept the colored people of Maryland in the mental darkness in which slavery had left them. The association, as we learn from its report for the month ending June 19, now sustains 70 schools, with an average attendance of 5,645 pupils and 76 teachers. These are established in every county in the State but three, and there is a steady demand for more. Some idea may be gained of the interest manifested by pupils and parents, and of the devotedness of the teachers, when it is known that the term of schooling occupies nine months of the year, while in Maine, which has about the same population, the school term averages only 5·7 months, or in Pennsylvania, which has about the same density of population, only 5·8 months, and in Massachusetts, even, but 7·8 months. Those who desire to aid the association to continue its beneficent work till the State shall have been shamed into assuming its proper charge, may send their welcome donations to Jesse Tyson, treasurer. Some unscrupulous persons have been soliciting contributions in the New England States for this association, both without its authority and beyond the legitimate sphere of its agencies.

—From a report of Supt. Eberhart's, it appears that there are now in operation in Georgia 73 schools for freedmen, which are presided over by 107 teachers and contain 7,162 scholars. There is still an occasional display of hostility to the education of negroes, as in Griffin, where three school-houses one after another have been burned, or as in Americus and Elberton. On the other hand, in Augusta the judge of the police court recently imposed a fine of $50 on a boy convicted of disturbing one of the schools, and only two of the city papers opposed themselves to the sentence.

Notes.

LITERARY.

It would be well for the authorized publishers of the Episcopal Church to get out an edition of "The Prayer-Book Interleaved," adapted to the ritual in use in this country. In this book the Rev. W. M. Campion, B.D., and the Rev. W. J. Beamont, M.A., have collected all the data with regard to the origin and history of all parts of the service, so as to make it a complete hand-book of the ritualistic history of the English Church. We find out the authorship, so far as it can be ascertained, of all the prayers and litanies, the origin of all the festivals and fasts, and we are given sketches of the lives of all the saints commemorated by the Church. In addition to this there are continual references to the service-books of the Greek and Roman Churches, and a digest of all the acts of uniformity. It is a very convenient little book, though if it were in general use we fear the eye would too often, during the service, wander to the opposite page.

—Lord Macaulay, in the introduction to his history, said that when the first Briton became known to the Tyrian mariner he was little superior to the native of the Sandwich Islands. Antiquarians have taken up this statement, and have labored zealously to pour all kinds of contempt on their poor ancestors, declaiming vigorously that prior to the Roman conquest there was no kind of civilization in Britain, and that the Romans were the regenerators of the country. Losing sight of, or explaining away, all the early remains, such as Stonehenge and Caer-Craddock, they placed the Britons in the so-called "Stone-age." But a defender has at last risen for the much-maligned Celts, in the person of Mr. W. Walker Wilkins, who, in two numbers of the *Fortnightly Review* shows with much plausibility that they were much more civilized than is commonly supposed. The fact that most of the tin used by the Mediterranean countries came from Cornwall, shows not only that there was commerce, but that the "savages" must have had metallic instruments for mining, and were acquainted with the processes of smelting. Besides this we have, among the rare Briton remains found in barrows, remnants of chariots, with iron wheel-tires and buckles. The testimony of Cæsar is explicit as to the fact of their well-disciplined armies possessing thousands of war-chariots, and Cæsar's ill-success would go to prove somewhat as to the value of their social organization. Besides their war-chariots they had many other kinds of wheeled vehicles, some of which were so convenient that they came into general use in Italy. The abundance of chariots proves the existence of good roads. The ruins of the early fortifications of the Celts are scattered throughout Great Britain. Fortresses, strongly built of earth and masonry, in certain districts of Gloucestershire and Lincolnshire crown every hill-top. Stonehenge and Abury, with their gigantic monuments, built of roughly-dressed granite that must have been brought at least a hundred miles, are evidences of great mechanical and engineering skill. The culture and wisdom that Cæsar found among the Druids could hardly have existed among a people not yet emerged from low barbarism. Indeed the Romans learned something from the Britons. They found in Britain water-mills, which soon after Cæsar's return were introduced into Italy. They learned to dam rivers, to make weirs, and to use the shuttle and the blow-pipe. They might also have learned the properties of coal, which the Britons used to reduce their metallic ores. Remains of iron are indeed rare, as rust has long since destroyed most of them; but there have been found vases, armor, articles of the toilet, and countless relics which will substantiate the case which Mr. Wilkins has so well stated.

—Probably most of those who are interested in the higher school education of this country have read Mr. Atkinson's volume on the English public schools, and some few, perhaps, have seen the recommendations of the Royal Commissioners who lately investigated them. If any desire to know the exact present state of the larger endowed schools of England, and how far the recommendations of the Royal Commissioners have been adopted, they would do well to consult "The Public Schools Calendar for 1866." This calendar contains far more than an ordinary college catalogue of the details of life and instruction at the schools, and is full of instructive and entertaining matter relating not only to the nine great schools—Winchester, Eton, St. Paul's, Shrewsbury, Westminster, Merchant Taylors', Rugby, Harrow, and Charterhouse—but to the old endowed grammar schools, those of modern foundation, and the royal military academies at Woolwich and Sandhurst. The large public schools are principally supported by their revenues from lands and stocks. Eton, which is the richest, has a yearly income of about $100,000, beside a large fund in special trust for scholarships and exhibitions; Winchester has about $80,000 a year, as well as a large fund in special trust; Rugby has an income of less than $30,000; and Charterhouse about $40,000. Winchester is the oldest school, having been founded in 1387 by William of Wykeham, Bishop of Winchester; Eton comes next, with its charter bearing date 1441; St. Paul's was founded in 1512; Shrewsbury in 1512, Charterhouse in 1607, and the remainder between 1560 and 1571. One noticeable fact is that beside the classical and mathematical drilling which the boys receive—fully equal in quantity and quality to the teaching of our best colleges—athletic exercises seem a part of the regular course. Not that they are taught by the masters, but they are looked on with approbation by them; and on certain occasions all the schools are required to be present at them, excuses being only obtainable from one of the masters.

—It is currently reported that M. Gustave Doré has finished the designs for an edition of Tennyson's "Idyls of the King," which was translated into French prose for his use. Whether this be so or not, he is actively at work at an illustrated edition of La Fontaine's "Fables," and goes frequently to the Jardin des Plantes to study the habits and postures of some of the animals he has to draw. It is being published in parts at the price, in Paris, of half a franc per part. Some of the illustrations which have been published are almost if not quite equal to those of Kaulbach in his edition of "Reineke Fuchs." In the same manner is being issued "Le Capitaine Fracasse," the amusing story of Théophile Gautier, with wood-cuts designed by Doré. Specimens of both can be seen at Messrs. Mohun & Ebbs's, No. 546 Broadway.

—There is a rage for cheap publications of all kinds at Paris now. Grammars, dictionaries, histories, novels, and poems are being published in daily or weekly issues at two sous each, and are distributed throughout France by the agents of the *Moniteur du Soir*. This paper was started by the Government, who wanted to get some hold on the reading public, and who therefore devised the network of agencies which includes every petty village in France. Several other cheap papers have been started, as they find a ready market. One of them, *Le Soleil*, after a vain endeavor to obtain from Victor Hugo the right to the first publication of "Les Travailleurs de la Mer," bought from Lacroix & Co., the publishers, the right to print it in the paper. One of its rivals, *L'Evénement*, not wishing to be outdone, entered into arrangements with Lacroix & Co. to supply all of their six months' subscribers with the whole work for nothing. Upon this the proprietors of *Le Soleil* offer their three months' subscribers the illustrated edition of "Les Misérables," and are also publishing "Le Mangeur de Fer," a play which is now the sensation of Paris, so that *L'Evénement* is obliged to confess itself beaten. The subscription to *Le Soleil* for three months is only nine francs.

—The greatest historical discovery of this century—the discovery of the laws which regulated the Indo-European languages and their relations to each other and the parent stock—is due to Francis Bopp. With justice may he be called, as M. Renan styles him, the Lavoisier of language. Through him philology has become as exact a science as chemistry. The complete statement of Bopp's method appeared at Frankfort on the 16th of May, 1816. On the fiftieth anniversary of the day it was the intention of the learned of Germany to celebrate the event by the foundation of a perpetual fund, to be known as the "Bopp Fund," and consecrated to the progress of comparative philology. Bopp's "Comparative Grammar of the Indo-European Languages" appeared from 1845 to 1853. In 1857 the publication of a second revised edition was commenced. This edition M. Michel Bréal, the professor of comparative grammar in the College of France, has translated into French, the first volume of which has just been published. It is preceded by a learned and interesting introduction, in which the translator reviews the progress and history of comparative philology from its origin to the present time. The text of Bopp is classic, and M. Bréal has considered it his duty to give a mere translation, without any effort to group about the text the results of later studies, especially those which fill the precious journal of Kuhn and Aufrecht, which would have swelled the work to double its size. The notes are, therefore, few, but they make the reader regret that there could not be more from the author of the profound and interesting studies on the myths of Œdipus and Cacus, and on the relations between the Indian and Persian religions.

—A book has been recently published by Mr. James Hutchinson, of the Cape of Good Hope, which aims to prove that Homer had "the great poem of Vulmiki, the 'Rámáyana,' in his eye" when he wrote the "Iliad," and that "Homer was himself a Hindu; that is, he worshipped the same deities as the Hindus, and professed the same religion, there being at that time but one common idolatry prevalent in that portion of the world." He points out similarities in the plots of the "Iliad" and the "Rámáyana," and compares the rape of Helen to that of Sitá, and thinks the capture of Troy the

same as that of Lanka. It is very possible that Mr. Hutchinson has got hold of some ideas that, properly treated, may be worth something for comparative mythology.

SCIENTIFIC.

Egg-hatching in Egypt.—It is noteworthy that the system of hatching eggs by artificial heat, to which attention has repeatedly been called by travellers in the East, is practised in the Egyptian villages to-day apparently in precisely the same way as at any time in the last thousand years. Herr Enth, a German engineer in the Egyptian service, has recently published an interesting account of the system, for the details of which we must refer the curious reader to vol. clxxviii. of "Dingler's Polytechnisches Journal;" where will also be found working drawings of the furnaces employed.

The egg-hatching establishments are not common in Egypt. Upon the Delta there may be, perhaps, one for every twenty square miles of territory. The buildings are in themselves inconspicuous, though the uniformity of size and shape which they exhibit is astonishing. It would seem as if all of them had been built after a single model. This uniformity is the more remarkable in view of the fact that the modern Egyptians are in nowise characterized by either pedantry or precision. The furnaces for egg-hatching are usually situated in the midst of a village, and as they are built, externally, in the same style as the dwellings of the peasantry, they can hardly be distinguished from the huts which surround them. Moreover, they are in use only during a short period in each year, whence it has happened that, of late years, many travellers have altogether overlooked them. To the same cause, no doubt, should be referred the erroneous statement, not unfrequently made, that the old system of egg-hatching is now obsolete and forgotten. According to Herr Enth, this statement is altogether untrue, a very large proportion of the animal food consumed by the Egyptians being in reality poultry which has been hatched by artificial means.

Each establishment comprises from four to ten or twelve ovens, constructed of sun-dried bricks and the stems of palm-trees. These ovens are arranged upon the two sides of a central hall or gallery, some six or seven feet high by five feet broad. The gallery is arched above, and is provided on top with three or four small apertures for the admission of light and air. The length of the gallery is determined by the number of the ovens. At the front of the gallery is a doorway, two and a half feet high, which is kept closed with a wooden door. The building is usually so situated that the visitor is compelled to creep through several apartments of a dwelling-house in order to arrive at the opening of the gallery.

The position of each of the ovens is indicated by a couple of openings, of a foot and a half square, upon the side walls of the gallery. These holes are situated one above the other, and permit access to the interior of the oven. At one side of them is a niche, in which an oil lamp is placed when the incubation is in progress. Each of the ovens consists of a square vaulted space, about nine feet in length, breadth, and height. At a height of about two and a half feet from the floor, the trunks of four palm-trees are laid across from one side to the other of the oven, and these are covered with a bed of loam, in such manner that the oven is divided into an upper and a lower story. Communication between the two stories is kept up by means of a square hole, a foot or more wide, in the middle of the bed of earth; and in the vaulted roof, directly above this square opening, is a round hole a foot in diameter. The lower floor of the oven is left perfectly flat; but upon the floor of the upper story a shallow, pan-like concavity, a foot or more in width, is formed by constructing two low dams, or bands, of earth, running across the oven parallel to the length of the central gallery. The shallow depression thus formed is used as a fireplace, as will appear below.

Operations commence about the middle of January. A quantity of chopped wheaten straw, such as is commonly used as fodder for cattle and camels, in the condition in which it is left by the threshing-machines of the country, is scattered about the four walls in the lower story of the oven to the depth of a foot. The hole in the roof and the two lateral orifices of the oven are then closed, the straw is set on fire, and the draught of air so regulated by opening or closing the upper orifice that the straw shall slowly burn, or rather glimmer, away at such rate that in the course of twenty days it shall be completely consumed. Eggs are now placed in the extinguished ashes of the lower story, each oven receiving from four to six thousand of them. At this stage of the proceedings a peasant takes up his residence in the central gallery, the door of which is shut behind him and kept closed for a fortnight. Communication with the outside world is meanwhile kept up solely through the small holes at the top of the gallery. Through these orifices the man's food is passed in from time to time. Within the establishment, and accessible from the central gallery, is a magazine filled with straw, and the chief business of the superintendent or master of ceremonies consists in maintaining small smouldering fires of straw in the pan-like cavities in the earth upon the floor of the second story of each of the ovens. It should be mentioned in passing that the interior of the whole establishment is brought to a very equable temperature by the fires in the lower story before any eggs have been placed in it. The fires in the upper story are kept up for twelve days, during which time the openings between the two stories of the ovens and the central gallery are left open, and the aperture in the roof of the second story is kept partially closed. At the expiration of twelve days all the fires are put out, the eggs are transferred from the lower to the upper story, and all the openings of the ovens are closed and kept shut during five days. At the end of this time, upon opening the door of the upper story, the chickens are found hatched out and viable. When all the circumstances are favorable, 4,000 or more chickens are obtained from 6,000 eggs, while only about half the eggs are hatched when the conditions are unfavorable. Herr Enth has not as yet been able to satisfy his curiosity as to the degree of heat which is maintained within the ovens during the latter part of the process, since he could never induce a proprietor of one of the establishments to open its door while the process was in train. He is of opinion, however, that the temperature may vary through a very considerable range without influencing to any appreciable extent the result of the operation. Indeed, this may safely be taken for granted in view of the well-known indolence and carelessness of the Egyptian peasantry. The ovens are used but once a year, in February, at the time when the price of eggs in Egypt is at its lowest.

Improved Method of Preparing Jerked Beef.—A letter from M. Vavasseur to the secretary of the French Academy gives some details of improvements in preserving beef which have recently been put in practice in Uruguay. It is stated by M. Vavasseur that although numerous attempts have been made during the past ten or twelve years to introduce into the cattle-raising districts of South America the modern European methods of preserving flesh, none of these foreign processes have ever led to successful results. This failure will not, however, be found surprising, when the social condition of these countries is taken into consideration. But the process now in question, whatever its intrinsic value may be, has at least the merit of being indigenous, and of being a natural improvement upon processes which have been proved by long experience to be well adapted to local conditions and requirements. It may possibly turn out to be the first step in a series of improvements which shall eventually throw into the markets of the world the supplies of cheap meat now so much needed and upon every account so much to be desired.

The new process, which is in the hands of Messrs. Cybils & Jackson, wealthy citizens of Uruguay, is conducted as follows: The carcass of the slaughtered animal is drained of blood with the most scrupulous care, and is then skinned and quartered. The flesh, while still palpitating, is quickly cut into long strips, two or three inches in thickness and as wide as possible. The strips of flesh are now sprinkled with fine Cadiz salt and piled up on a table to a considerable height, a small quantity of salt being scattered upon each layer of the flesh. When the pile has become large enough it is left to itself for about twenty hours, then taken down and rebuilt upon another table, in such manner that the uppermost pieces of flesh of the first pile shall be at the bottom of the second. After the second pile has stood during twelve or fifteen hours it is taken down and the strips of flesh are stacked away in such manner that they shall be freely exposed to the air; but from sun and rain they are protected by a covering of tarpaulin. In these stacks the dry meat is left during several months or until sought for by purchasers. Up to this point the process is essentially the same as that employed in making the preparation called *tasajo*—which has long been exported from Uruguay to Cuba and Brazil for the use of plantation negroes—excepting that more attention is now paid to cleanliness and the selection of the pieces of meat. It is only at the moment that the meat is to be delivered to the purchaser that the new process is applied. This consists simply in subjecting the dry, salted flesh to very powerful pressure. After having been thus compacted together the meat can be kept for an indefinite length of time without detriment. Of course the dry meat is very much reduced in bulk by the pressure, and can be very cheaply transported. The masses of compressed meat are of rectangular form, about two feet long by a foot in width and thickness, and their weight is about a hundred Spanish pounds. As sent into commerce they are covered with thick close cloth, carefully sewed.

Before being used, the compressed meat must be soaked in fresh water for twelve hours. It gradually absorbs the water, softens, swells up, and acquires the appearance of fresh meat. M. Vavasseur finds it preferable to

beef salted in the usual way, and makes no question as to its being a very valuable aliment.

This preparation is probably identical with the "South American beef" which excited much comment in the English journals a few months since. But, as imported into London and Liverpool, this meat was found to be of very variable quality, much of it being unfit for consumption. If we remember aright, the verdict of the public was at that time decidedly adverse, although it was admitted by most that many samples of the dried beef were excellent. It is still to be hoped, however, now that the simplicity of the process has been made apparent, that in the course of time the manufacture may be conducted with such method and neatness as to yield, even in native hands, no questionable products.

LOSSING'S HISTORY OF THE CIVIL WAR.*

A FACILE writer, of large experience in his peculiar walk, and aiming not merely to record facts, but to illustrate, by ample quotations and references, the conditions of thought and feeling to which these facts owe their origin, Mr. Lossing has not failed in this first volume of his history of the civil war to produce an eminently readable book. For that circumstance he is much indebted to his theme, the interest of which has not perceptibly diminished since the smoke of the contest first rose and revealed to the nation the victory it had won, and also the grievous losses it had sustained. But while dozens of histories, covering the same epoch, will live their brief hour and be absolutely forgotten, the one before us possesses substantial claims to remembrance in the lively pictures it presents, both with pen and pencil, of the actors in our great drama of civil war, and particularly of those who were instrumental in raising the standard of rebellion. Mr. Lossing has for the most part permitted the latter to tell their own story, drawing liberally for that purpose upon newspapers, speeches, letters, and every available source of authentic information, and thus preserving, in a permanent and readable form, many fugitive scraps of historical material which might otherwise be forgotten, and which are important in tracing the connection between motives and acts. If to us of the loyal States, after the lapse of only five or six years, it seems almost incredible that sensible men, and brave men, as they also proved themselves, could have given utterance to such intolerable nonsense and bombast and have cherished so many delusions as did the rebel leaders in 1860–61, how much more astounding must it appear to the generations coming after us; and how necessary it becomes that the latter should know the peculiar circumstances under which the rebellion was ushered in. The transport, amounting almost to delirium, which possessed the instigators of the movement in the early days of secession—while the belief in a Southern Confederacy was unclouded by any apprehension of resistance by the North—finds its only counterpart in the farcical acts of the Fenians of to-day, on whose "centres"—head and otherwise the mantles of the Yanceys, Rhetts, Toombses, and Hammonds seem to have descended.

It has been so customary to reproach the North with short-sightedness in not comprehending the earnest purpose of the Southern conspirators, that the mistake of the latter in ignoring the energy and strength of their adversary—a mistake, by the way, under which some half-rehabilitated rebels still labor—has never, perhaps, been sufficiently noticed. And yet one can scarcely open a Southern paper, or read the speech of a full-blown secessionist of that chaotic period which preceded the outbreak of hostilities, without finding passages far exceeding, in overweening self-confidence, the utterances of the Northern press or of Northern men. Thus, the Charleston *Courier* of Feb. 12, 1861, quoted by Mr. Lossing, discourses in the following strain of the anticipated grandeur of the newly-born "Confederacy:" "The South *might*, under the new Confederacy, treat the disorganized and demoralized Northern States as *insurgents*, and deny them recognition. But if peaceful division ensues, the South, *after taking the Federal capital and archives*, and being recognized by all foreign powers as the Government *de facto*, can, if they see proper, recognize the Northern Confederacy or Confederacies, and enter into treaty stipulations with them. Were this not done, it would be difficult for the Northern States to take a place among nations, and their flag would not be respected or recognized." This language, compared with which Mr. Seward's celebrated vaticination, that the rebellion would prove but a ninety days affair, seems tame indeed, proceeded from men who were neither lunatics nor impostors. It was written with deliberation, and expressed the firm conviction of the great mass of the Southern people; and the reader will find its parallel on many pages of the book before us. It might suit the purpose of Davis or Slidell or Benjamin, who knew something of the spirit and capacity of the North—and how little, after all, was that something—to indulge in such outbursts to "fire the Southern heart;" but the Charleston and Richmond editors were terribly in earnest in what they wrote, and their readers were not less earnest in believing what they read. Thus delusion and imposture worked hand in hand until the exultant Southerner saw in fancy the North prostrate at his feet, and an empire, whose corner-stone was to rest upon "the great truth, that the negro is not equal to the white man," stretching in almost limitless grandeur before him. Although this illusion was soon partially dispelled, there can be little doubt that the stubborn resistance of the South during the whole war was in no slight degree induced by a belief in their own intellectual and physical superiority, and an ignorance or disdain of the power of the North, acquired in the preliminary stages of the rebellion. In view of this fact, each boastful paragraph of a newspaper writer, each bit of insolent bravado uttered in the legislative chamber or from the stump, has its special significance. The retrospect is too sad to permit us to regard these utterances with the derision they once provoked. Rather let us assign them to the keeping of the historian, to whom they now rightly belong, and whose narrative would be incomplete without frequent reference to them. Of this latter fact Mr. Lossing is fully cognizant, and in no history of the war which has yet appeared do we remember to have seen the infatuation under which the Southern people rushed into rebellion more clearly or copiously set forth than in his pages. This constitutes the chief merit of the work, which will compare favorably with the author's well-known "Field-Book of the Revolution."

The "Pictorial History" commences with the nomination of candidates for the presidency in 1860, and carries the narrative down to the termination of the battle of Bull Run. Written in a popular style, and in the main complete and accurate, it reflects too fully the earnest Union feeling of the author to be classed among the works which will hereafter be universally referred to for information concerning the war. Mr. Lossing is a good hater, and scruples not to call things by their right names, when probably the reader would infer as much from the context. Hence the admirers of Jefferson Davis and Alexander H. Stephens will not perhaps relish his undisguised contempt for the hypocrisy of the one or the vacillation and time-serving of the other. Hence timid and moderate men who do not believe in "coercing a State," and who deprecate the "tyranny of the North," or at least think there was "fault on both sides," will call the book partial and one-sided. With the loyal American reader who witnessed the outbreak and the quelling of the rebellion, such objections will have little weight; but to those who cannot appreciate our hatred of the secession idea, and who desire a dispassionate narrative of the war, the coloring which Mr. Lossing has imparted to his history will naturally seem to impair its trustworthiness. It may be doubted whether within the present century the latter class of readers will encounter a history of the rebellion emanating from this country which shall be wholly above suspicion of partisan bias. Such a history of the American Revolution has not yet been written.

Mr. Lossing describes, with considerable animation and at, perhaps, unnecessary length, such opening scenes in the great drama as the bombardment of Fort Sumter and the battle of Bull Run. Remote, comparatively, as these events now seem in point of time, and trivial in comparison with sieges and battles of after occurrence, they possess a moral significance as the occasions of the first popular uprising in the North and the first great national humiliation, which renders excusable some fullness of detail. Among the anecdotes related by the author in connection with the surrender of Sumter is the familiar one of the notorious Pryor, who, at a conference of Union and rebel officers within the fort, is said to have swallowed a glass of poison lying on the table before him, under the impression that it was whiskey, and to have been obliged, in consequence, to take a strong emetic immediately afterward. The incident, except as an illustration of ill-breeding on the part of one of the chivalry, is not worth recording, even if true, in a serious history, and has generally been considered as belonging to the humorous, apochryphal literature of the war. Has Mr. Lossing any means of authenticating the story? We have understood, on the best authority, that Pryor was not in the fort at any time previous or subsequent to the surrender. The majority of readers will probably not accept the author's conclusion that Gen. Patterson, in failing to prevent Johnston from forming a junction with Beauregard in time to decide the battle of Bull Run, "seems to have done all that it was possible for a prudent and obedient soldier to do under the circumstances." There is now abundant evidence that Johnston, instead of having "fully thirty thousand troops," was in greatly inferior force to Patterson; and the demonstrations made by the latter for the purpose of occupying the attention of the rebel general were, by Patterson's own showing, of so feeble a character that Johnston was not for a moment deceived by them, but moved off in perfect security to Manas

* "Pictorial History of the Civil War in the United States of America." Vol. I. By Benson J. Lossing. Philadelphia: George W. Childs. 1866.

sas. If public opinion is fixed on any one matter connected with the military operations of the war, it is with reference to the inefficiency of Gen. Patterson as commanding officer on the Upper Potomac in the summer of 1861.

The pictorial illustrations are numerous and of unequal merit. Those representing remarkable places and events, though prepared with care, are generally on too small a scale, and consequently too stiff and cramped in the drawing to convey a correct idea of their actual appearance. Most of the likenesses of prominent men are easily recognizable. Some are positively bad; and, as a general rule, all the illustrations seem hastily and carelessly printed. This, however, is in many cases quite as much the fault of the engraver as of the printer. In his eagerness to depict whatever was noticeable in connection with the war, the author has in too many instances selected unimportant places or trivial objects. Such illustrations as that representing the costumes worn at the inauguration ball at Washington in March, 1861, will not be esteemed of much value by posterity. The ladies certainly should protest against it.

CRAVEN'S DAVIS.*

THE fact that there are two sides to a question has just penetrated the astonished brain of Dr. Craven. Perhaps hereafter, when he has got well over the effect of the novel sensation, he may go a little further, and see that it is not impossible for the human mind to take a view of both sides at once, that it is not of necessity driven to discard one utterly because it has caught sight of a second, that blindly hating the one and cleaving to the other is not the sole substitute for a previous blind hating of the other and cleaving to the one. To hate neither, and give each due weight, is a stage of development to which, though it seems a long way ahead of him at present, Dr. Craven may yet attain.

In 1864, a rebel was to him a rebel, a sanguinary enemy of the Government, wilfully, hopelessly wicked. Hanging might be too good for him, but could scarcely be too bad. In 1866, a rebel is a Confederate; it turns out that he really has something to say for himself. Strange as it may seem to the ill-informed, prejudiced, bloody minded American people, which has not been the medical attendant of Prisoner Davis, and has had no opportunity to know anything about his past and present works and wishes, Dr. Craven has discovered that many of these rebels actually thought they were in the right, that they were conscientious secessionists resisting oppression, State-rights Democrats with a regular set of doctrines. How idle and wicked it must therefore be to talk of punishing them! Treason is one thing—a bad thing, of course; but treason with gentlemanly manners and reasons in its mouth is a thing so very different that Dr. Craven, who apparently had not conceived it possible, can make nothing of it. The easy task of confusing his physician must have been a pleasant and refreshing relaxation for Mr. Davis in his enfeebled condition, when bodily exercise was too fatiguing and mental labor was harassing. The doctor had always been an opponent of slavery too, he says, and from his youth up had acted with the Republican party. That may have had much to do with his discomfiture; we are not the more inclined to trust him on that account. We all know what becomes of the child of Christian parents whose mind is a little inactive, who has gone to Sunday-school without arguing or asking why, and to church and knew not wherefore, and been a believer all his life without being able to give any reason for the faith which is in him. Some hardened infidel comes along, and with a word the unpractised controversialist's faith is toppled over; he weakly succumbs to Tom Paine as if Bampton lecturers were not.

Dr. Craven, who on a day in the summer of 1864 gets down from his saddle in a Virginia road, and, walking up to a wounded man, takes a look at him, hoping that it may be a Southerner who is suffering, in the summer of 1866 is a surgeon at Fortress Monroe, and has Jefferson Davis placed in his charge. All his patriotic hatred, we are glad to say, is very quick in oozing out of him. It is not wonderful. His patient was a person whose condition, if it appealed to a soft heart, appealed also to a soft head. He was a sick man who needed careful attention; he was a fallen man, who felt his fall most acutely; his life was thought to be threatened by his enemies. Then, too, he might easily have been mistaken for a hero. Before 1861 he had been great with that greatness which is based upon the *Congressional Globe*, and since 1861 he had been, if not the head, at least the figure-head of a bloody rebellion. We forgive Dr. Craven for being overpowered by a man whose name had been in all the newspapers. But he might have pleaded for his patient without bringing dishonoring charges against his Government. He might have dedicated his book to Secretary McCulloch without accusing everybody else of a lack of wisdom, magnanimity, courage, and sympathy with misfortune. He might have approved his own Christian charity without wilfully shutting his eyes to the fact that his countrymen are no more barbarous than himself. Since the middle of May, 1865, since the first month after Lincoln's murder, how many of his fellow-countrymen and fellow-countrywomen does Dr. Craven pretend to believe merciless, infuriate, thirsting for Davis's blood? How many before that time demanded it except as the blood of a man who was proclaimed guilty of murder, who was believed capable of assassination because he had never rebuked Quantrell nor Forrest, and had shut his eyes and stopped his ears while Wirz and Winder were earning the ignominious death which one of them afterwards suffered?

As we read the story of Davis's prison life this consideration should be borne in mind, that for weeks after his capture he was looked upon not as a political prisoner merely, not as a prisoner of war, but as a man solemnly accused by the highest authority in the land—by the President and his Cabinet—of participation in secret murder. The public mind, new to conspiracies, was wild with rumors of plots to rescue Davis, and heated with all it was hearing of the plots which had just been so successful. And it was firmly believed that, whether or not Davis knew for what purpose Booth was hired by Confederate agents and paid by Confederate agents, he had at any rate been accessory to murders by the hundred and the thousand at Andersonville. Remembering this as a part of the history of that time, let us look at Dr. Craven's story. It opens with the 22d of May, when the prisoner was transferred from the steamer to the fort, and shut up in his casemate. On the 23d of May occurred the scene of the shackling—the event most to be regretted of any which has befallen the prisoner since his incarceration. Dr. Craven was not an eye-witness of it, but he probably had his information from Captain Titlow, under whose supervision it was done, and doubtless the account is quite correct. His narrative contains no hint of the reasons which may have caused the act, and probably he had no exact knowledge on the subject; but, as it seems to us, it is a lack of candor which keeps him utterly silent as to any possible cause. The book is a not over-scrupulous plea for the prisoner, and is intended to call forth the pity of the North. We can find no other reason than that for the suppression of considerations which are necessary to a fair statement of the case. As to the ironing, even with the mitigating circumstances—the fear of rescue, the fear of suicide, the heinous crime with which the prisoner was charged—we regard it as a great mistake. We do not call it a wanton cruelty only because we are not in possession of the facts on which the Secretary of War based his order to General Miles. But it does not appear that fettering Davis's ankles could have prevented his committing suicide; it is difficult to see how it could have hindered rescue, or why it was necessary for the safe keeping of a man shut up in such a fortress, and always, night and day, most vigilantly watched by armed guards. It seems more than likely that the chains were put on him to add to the ignominy of his situation. But this, if this were the fact, would be the infliction of punishment upon a man who had not been sentenced, or even tried. On the 28th of May the fetters were taken off, the physician having reported to General Miles that the prisoner's health required their removal. This occurrence, which may or may not be what our author calls it — a triumph of "the doctrinal toga"—was certainly not dictated by a spirit of cruelty. Five days only after they were put on, the chains were taken off. On May 26th, army rations not being to the prisoner's liking, General Miles allows the doctor to send him in tea and toast, and thenceforth he is supplied with food from the doctor's table. On the 24th of June, after he has been confined a month and two days, he is permitted to walk in the open air for an hour every day. On the 23d of June the two guards who had been kept in his room were removed, for it was found that their presence had an irritating effect on Mr. Davis's nervous system. During the warm months he constantly complained that the air of his casemate was damp. On the 7th of September the authorities ordered that a room in Carroll Hall should be prepared for him, and on the 5th of October, as soon as his new quarters could be got ready and before the Virginian autumn was far advanced, he was established in the room which had previously been occupied by Grant and Sherman when they were on duty at the fortress. We confess that we see nothing in the treatment which Mr. Davis has experienced since the time when his irons were knocked off that looks like cruelty. On the contrary, taking Dr. Craven's story for true, we doubt if among all the prisoners of state now undergoing or awaiting punishment throughout the civilized world there is one who is to-day so well cared for and so comfortable as Jefferson Davis.

* "Prison Life of Jefferson Davis, embracing Details and Incidents in his Captivity, particulars concerning his Health and Habits, together with many Conversations on Topics of Great Public Interest. By Lieut.-Col. John Craven, late Surgeon U. S. Volunteers, and Physician of the Prisoner during his confinement in Fortress Monroe from May 25, 1865, up to Dec. 25, 1865." New York: Carleton. Pp. 377.

We learn from the book very little that is new about Davis's character, and very little, if any, light is thrown upon the history of the Confederacy. We knew before that the Confederate ex-president hated Johnston and Foote, and Brown, of Georgia, and the South Carolina Rhetts, and that he liked Lee and Jackson and Bragg and Pemberton. We supposed he would think it impossible for white men to raise cotton, rice, or sugar. We have been told by many Southern men that the negro is much in need of the fostering care of a superior race; we only wish he were going to get it. We have been told, also, by many Southerners before Mr. Davis went into Fortress Monroe that the people of the South are aristocrats and good horsemen, because they retain some remnants of cavalier customs, and virtuous because they are a simple agricultural people; and that the people of the North are money-grubbing, mean, and democratic, and that of all Northern States Massachusetts is the worst. We think we have heard before, too, that it is very rare to find in the South an instance of the cohabitation of a white man with a woman of color, and we believed it as much before as since Mr. Davis made the statement.

In short, if any one wishes to know Mr. Davis's opinions in reference to the North, a ten-years-old copy of "De Bow's Review" will give them; his opinions on the negro are to be had in any Southern newspaper of the past six months; his views of reconstruction and secession are those of A. H. Stephens and the New York *News*. He is a faithful representative of the section to which he belongs, and the book might have been circulated as testimony by the Joint Committee on Reconstruction.

THE MOON-ALFORD CONTROVERSY.*

A DIGNITARY of the Church of England known to the literary world as the editor of a rather poor edition of the Greek Testament, a volume of moderately good verse, and a weakish set of "Meditations," undertook, through the medium of what we should call a lyceum lecture, to enlighten his fellow-countrymen on the subject of the proper use of their mother tongue, and afterwards published his lucubrations in that excellent and highly orthodox periodical, "Good Words." The Dean of Canterbury's object was a laudable one, and his remarks and criticisms are by no means without value. Unfortunately, however, his own English style is anything but classically correct, and the defect was the more noticeable as, after the fashion of church dignitaries, he spoke in rather an *ex cathedra* tone on the subject. A gentleman who rejoices in the name of George Washington Moon, and whose opinions in regard to America and her affairs are, we trust, worthy of the name he bears, and therefore quite different from those of the dean, was moved to publish a rather sharp criticism of the shortcomings of our dean's style, which appears to have excited in him feelings of very undiaconal anger. To these he proceeded to give vent in the course of another lecture on the same topic, delivered to the Church of England young men of Canterbury, in which he called his critic substantially, though in phrase, to be sure, a little more circumlocutory, a fool and an ass, whereupon his critic, nothing daunted, administers a second castigation in another pamphlet, quite as severe and quite as well written as the first; and then the dean, recovering from his anger and finding that his opponent carried quite too many guns for him, proceeds to explain that his epithets were only intended in a Pickwickian sense, invites his critic to hear his next lecture—telling him that when he comes he will recognize his inviter at the railway station as "an old party in a shovel"—corrects, in obedience to his opponent's criticism, twenty-seven places in the second edition of his little book, leaving many others that would be the better for the same treatment, and all ends pleasantly. We are bound to say that, whatever advantage Mr. Moon may have in point of style, the dean, after the first ebullition of his anger, compares very favorably with his opponent in point of courteous manners.

The result for the reading public is two little volumes, very attractive for the tasteful simplicity of their outward appearance and typography, and which, taken together, form a really amusing and instructive study on minor points relating to the "Queen's English."

The dean's is a pleasant enough book of gossip upon small points of criticism. He is sometimes very right, sometimes quite wrong, and at other times very silly—as witness his solemn discoursing at page 273 on the enormity of "greasing the wheels of talk," as he elegantly expresses it, with expletives, and his very comical hypothetical derivation of that apparently harmless phrase "Dear me!" "It may not be amiss to remember," solemnly says the dean, "that idle words are seldom quite harmless," and the mode by which he illustrates his principle is amusing enough.

The dean, of course, is scandalized by the American fashion of spelling "endeavor" without a *u*, and indeed draws an awful general warning from the deterioration which the Queen's English is undergoing at the hands, or rather at the mouths, of us Americans. "Examples: American debasements" is the marginal notice in one of his papers. The profundity of his knowledge of things American may be estimated by his absurd remarks on our civil war. He has a good deal to say on the subject of Englishmen misplacing their *h*s, and makes a desperate attempt to tell a good story about a barber and the cholera, in the course of which the unfortunate subject of his sentence gets separate from its verb by no less than eight-and-twenty other nouns and pronouns, to the immense triumph of George Washington, whose eagle eye also detects another sentence which, by the law of permutations and combinations, can be read as he avers—and he duly tabulates his statement—in no less than 10,240 different ways. What can an unfortunate dean do in the hands of such a critic? His pages suddenly appear filled with the most unexpected statements and personages in the most singular positions. His editors "fall from ignorance;" he discovers himself to have "compositors without any mercy;" his men "lose their mothers in the papers;" he "introduces bodies;" his carriages "would have been come to grief in a bottomless swamp"—all through the criticism of the merciless Mr. Moon, who marshals in battle array a whole army of veterans against him—Quintilian, Campbell, Kames, Blair, and all the rest.

The unhappy dean can do nothing against such a host but desperately defy them all, and most especially his tormentor, Moon, and declare that we must "write good, manly English—explain what we mean as sensible, intelligent men cannot fail to understand it, and then if the rules be good we shall be sure to have complied with them; and if they be bad, our writing will be a protest against them." Unfortunately for this short-hand method of acquiring a good style, the writing of "good, manly English" does not come by nature; and a good many "sensible, intelligent men" are unable to express themselves in such English as other intelligent men cannot fail to understand, or to understand the English of other sensible men, to say nothing of the English of men who are not altogether as sensible as they might be. We fear the usefulness of the Campbells and the Kameses cannot be disproved in such a summary manner, and think that the dean, by studying some of their precepts, might learn what it is that makes Mr. Moon's English so much better than his own.

Altogether it is a very pretty quarrel, and the more such discussions we have, the better, provided they can be kept free from personal asperities. It was wrong in the dean to hint at "a most abnormal elongation of the auricular appendages," for it makes George Washington angry, and he very naturally enquires, "Why do n't you call me an ass, and be done with it?" And, on the other hand, it is unchristian, and not in accordance with that moderation which characterized his great namesake, to triumph so inordinately over his adversary, and to snuff the battle from afar and to say, "Ha! ha!" as Mr. Moon does on page 84.

We are no friends to hypercriticism or to that finical niceness which is more concerned about the dress than the thought it clothes. Language is a living, growing thing, and great liberties within the bounds of good taste and perspicuity may be allowed to the idiosyncrasies of individual writers. We can even tolerate Carlyle, though we cannot tolerate his imitators. The style that does not savor of the man who uses it is a poor style. But there is such a thing as perspicuity, and there is such a thing as usage. It behooves us all to guard our mother tongue against the debasing inroads of slang and the corrupting influence of loose thinkers and careless writers. We do not value very highly the authority of great names in determining questions of style. The dean falls back upon the authority of Scripture in defence of some of his indefensible positions. But examples of bad grammar and bad construction can be found in King James's translation; and all our standard writers, not even excepting Addison himself, to whose study we used to be told to give both day and night, have furnished an abundant harvest of errors for the critics. Yet there is good writing, and Mr. Moon's is good; and there is bad writing, and, in spite of mending, the dean's is bad. To find what constitutes the difference would be, we suppose, to find the difference, whatever that may be, between a Mr. Moon and a rather pragmatical and conceited, but doubtless good and worthy, dean of the Church of England.

Of the neglect of this important branch of study in our systems of education, and of the right method of pursuing it, much might be said; but we would rather say it on some other occasion than when chronicling such small-beer as this controversy between the Dean and Moon.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

WHAT MIGHT HAVE BEEN.

The disappointment which Mr. Stevens expressed a week ago over the result of the labors of the Reconstruction Committee has probably been felt, though not so keenly, by thousands who make outward professions of satisfaction with that result, though perhaps very few have reached Mr. Stevens's age under the delusion, from which he has been so cruelly awakened, that they were dealing with angels and not with men. It is impossible, in fact, for anybody to recall the expectations by which the public mind was animated for a month or two after Mr. Lincoln's death, and not be painfully reminded of the difference which is almost always found to exist in politics between promise and performance. At that time it was confidently believed that there would be such a general punishment of traitors that treason would be made, if not for ever "odious," as Mr. Johnson promised it would be, at least for ever dangerous. In fact, the intentions of the new President on this point appeared to be of a most sanguinary character, and a good many excellent people, who felt just as indignant with the South as he did, were afraid he would disgrace the nation by his cruelties to the leaders. Every time he delivered a speech to a deputation the whole South quaked, especially "the aristocracy," and the poor prisoners trembled in their casemates. The rebels of large property were to be got rid of root and branch. He had lived amongst them and fought them twenty years, knew them well, and flattered himself he knew how to deal with them. We certainly all believed that he did know, if anybody knew, and we all folded our hands and waited to see him reform Southern society, under the guidance of his bitter experience. The essential thing, he said, was to break down the large planters, who were the arch rebels. It was not enough to take their slaves from them; he knew better than that. This was already done, and was very well as far as it went. They must lose their overgrown estates as well, and be scraped down to the dimensions of hard-working farmers; so he excepted them all from the amnesty, and the North, trusting to his wisdom and knowledge of Southern needs, acquiesced in his decision. It was hard measure, everybody felt, to deal out to so large a class; it would probably prejudice us in the eyes of foreign nations, and would prolong ill-feeling; but Mr. Johnson said it was necessary, and it was not for us, who had never fought this aristocracy for long years in Tennessee, to differ with him.

Now, of these two things which he pronounced in May, 1865, and pronounced deliberately, repeatedly, as the result of long experience, to be absolutely necessary to the reorganization of Southern society and the future peace and security of the Union, and which he then placed foremost in his plan of reconstruction, he has performed neither. He has punished no traitor. He has given no indication of any desire or intention, since the period above mentioned, to punish any traitor. He has taken every possible means open to him to show that he does not consider it necessary that treason should be made "odious," or even consider rebellion to be treason. On the contrary, he has on more than one occasion given us clearly to understand that, in his opinion, the only good purpose that would be served by the trial of Davis, or of any other rebel, would be the decision, as an interesting point of law, of the question whether it is possible for a man acting under the orders of his own State to commit such an offence as treason against the United States. He issued what now appears to have been a very foolish proclamation, charging Davis, Clay, and others with having instigated the assassination of Mr. Lincoln, offered an enormous reward for their apprehension, and when poor Davis was caught clapped him in irons. The public thought, of course, that when he made this awful charge—a charge which, when made against men who had occupied the position that these men had occupied for so many years in our society and government, and on whom one third, at least, of our countrymen had lavished the highest marks of confidence in their gift, would, if proved, have been, perhaps, everything considered, the foulest blot that could have fallen on our civilization—he must have had in his hands proofs as strong as those of Holy Writ, and that he would bring the wretches to justice without delay. It now appears he had nothing of the kind. It appears that he had no foundation for this charge that would bear either a lawyer's scrutiny or public criticism. It appears that the charges of the proclamation were simply passionate and ill-considered displays of zeal, which, as it was so very short-lived, can hardly have been very sincere. We say that all this *appears*, because no allusion to that charge has ever since been made, because one of the accused has been discharged from custody, and no pretence is made that Davis is held upon it.

Now as regards Mr. Johnson's course toward the Southern aristocracy. He pronounced their breakdown necessary, and he armed himself with the power of accomplishing it by making the possession of a certain amount of fortune presumptive evidence of unusual guilt. We speak advisedly when we say that he has not given the smallest proof that his opinion with regard to the necessity for breaking down the aristocracy was ever sincerely held. He has, without assigning any reason for it, refrained cautiously from taking any step that was in the least likely to break it down. The abolition of slavery he has insisted upon, because he found the work already done; but everything beyond this which seemed likely to alter the structure of Southern society he has steadily and pertinaciously resisted. He has given the whole weight of his influence, personal and official, to keeping things at the South as nearly in their former condition as possible. He has exacted nothing which the war had not rendered inevitable. He has done absolutely nothing that he could avoid doing to weaken the class whose very existence he often informed us was a standing menace to our political system. He has confiscated no man's property, and if he has refused pardon to any of his dreadful "$20,000 men," as part of a system intended to impoverish and break up this class, we have yet to hear of it.

Now, it may be that the course he has actually taken has been wiser than the one he first traced out for himself. It may be that his wild speeches of last winter embody more wisdom than his wild speeches of last summer, but how are we to know this? Has he, with this sudden change in opinions fresh before our eyes, not been asking a vast deal too much in asking us to believe he was best fitted to do the work of reconstruction? If his views in May were worthless, what reason was there, we ask in the name of common sense, for supposing that his views in October or November were any better? Is it safe to trust a man with any task of statesmanship who gives you plainly to understand that the words he uttered, standing by his predecessor's grave, with the most awful responsibility pressing upon him, and a whole nation looking up to him with a confidence that now seems childish, were but as idle wind, to be repudiated or forgotten on the morrow, without even an excuse or an explanation. If Mr. Johnson meant, after his accession to the presidency, to carry out the policy which he then traced, his subsequent course shows him to possess so little judgment, so little knowledge of the only subject in the whole range of human knowledge of which anybody expected him to know anything, that it would have been madness for Congress to have let him have his way. If he did not mean to do so, his subsequent course furnishes an illustration of his dishonesty too painful to make comment on it possible.

His position at this moment is tolerably humiliating. He had, when he took office, one of the finest opportunities that has ever presented itself to a statesman. Other men, of as mean beginnings as he, have reached dignities perhaps as lofty; but we doubt if there is a case in history where a man has found himself armed with power which there was so little temptation to use for mean, or base, or unjust ends. He had a whole nation at his back still seething with the excitement of a contest which suffering had purified, which, begun in love of country, every battle and march had helped to raise into a crusade for simple freedom, simple justice, simple humanity. He found the American people in perhaps the noblest mood to which any people has ever risen—to which, perhaps, in our lifetime this people will ever rise—flinging its armies, its treasure, at his feet, and piling its blessings on his head, and asking

him to see to it that the last vestige of contradiction between its principles and its practice was removed, and to proclaim to the world that the national recognition of the equality of men which the actors in the first revolution had put on paper, the actors in this revolution had embodied in their law. He let the golden moment slip away; took to mumbling before his old idols the old incantations; saw the zeal which had accomplished so much, and stood ready to accomplish so much more, cool down before his eyes; saw the economists and calculators and money-changers go back to their books, and came down from his eminence to devote himself to the construction of "his policy," the exact nature of which, probably, nobody will be able in ten years to remember, and which will leave about as much trace on the history of the country as the Saturday speeches in the House of Representatives.

UNDERWOOD, FULLERTON, AND STEEDMAN.

The Mussulman, to avert the influences of the evil eye, sets himself against the wind and, spitting, spits in his own face. It is not a dignified performance; in doing it he does some little violence to his natural self-respect, but then he propitiates a higher power. So long as the report of General Fullerton conciliates the regard of the superior who sent him on his mission, the general probably cares but little that he disgraces himself in making it, that he shows most clearly that the unadorned truth, nothing set down in malice and nothing extenuated, was by no means what he sought and by no means what he found. This is harsh language, but there is justification for it, as we propose to show very fully in very few words. Falsehood goes many leagues, over a State or two, for instance, in two or three days, while truth is getting ready to travel; but the plain tale, when it comes, is very conclusive.

Mr. F. H. Underwood leases a plantation on Wadmelaw Island, South Carolina. The President's investigating agents paid it a flying visit in the end of May, and this is what they say they found there. Briefly, they found "the Underwood oppressions." It was a man "from Boston, Mass.," who cultivated and rented the farm and who also kept a store on the place. His freedmen he worked by the task, "which is precisely the manner in which their former owners worked them." The wages offered were fair enough, but when the time of payment came the laborers received not money or its equivalent, but tickets good for so much provisions at Underwood's counter. But there the storekeeper sold corn at the extortionate price of three dollars a bushel. Mr. Towles, a neighbor, was willing to sell the people corn at two dollars a bushel and take Underwood's tickets in payment; but Underwood procured a special order from the Bureau, and Towles was compelled to desist. There was no meat in Underwood's store, and the involuntary customers were compelled to take what the storekeeper chose to give them. They gathered round General Steedman and General Fullerton and "complained bitterly, stating that with the wages paid them they were unable to earn enough to buy, at the prices charged, their necessary subsistence."

One reads the report as it appeared in the New York *Herald* correspondence, or afterwards as it appeared officially, and naturally he says to himself that the honorable commissioners have come across another wolf in sheep's clothing; another of those detestable New Englanders who have all his life long disgusted the soul of Jefferson Davis, as Dr. Craven reports him; one of those men "from Boston, Mass.," like Benjamin Franklin, the ex-president's aversion, "a true type, or incarnation of the New England character—hard, calculating, angular, unable to conceive any higher object than the accumulation of money." This is the inference which the report makes easy for us to draw. But the correspondent's version of the visit caught the eye of Mr. Underwood's agent, and his enlightened self-interest at once saw that when his character was calumniated and stolen away; when he was branded a swindler and thief, a tyrant equally oppressive as "the former owners" of slaves, his darling object—the accumulation of money—would be more difficult of attainment. Actuated, therefore, by sordid, money-grubbing motives, he immediately demanded an official inspection of his plantation. This was granted, and from a copy of the official report of the inspecting officer we take the following facts, which effectually dispose of the report made by the correspondent, as well as the somewhat scantier report of the two generals.

Mr. Underwood's laborers were working under a written contract, of which he had one and they another copy, while a third copy was on file in the office of the Freedmen's Bureau.

When the contract was made the people were starving, ragged, shelterless, and nearly all sick of the small-pox, or just recovering from it. Mr. Underwood has since built houses for them, free of charge; they are now well clothed and well fed, and a school has been established where instruction is given gratuitously.

The laborers receive fifty cents a "task," or quarter of an acre, for hoeing, hauling, and otherwise handling the cotton crop. It is their immemorial manner of working, and the one which naturally they much prefer to any other. The accounts of the plantation and the statements of the hands show that the able-bodied laborers have averaged three "tasks" a day, and it is notorious that the day's work is very often done on that as on other plantations before one o'clock in the afternoon. After that hour they work on the land set apart for their own use, of which there are 120 acres, 90 acres being in cotton and 30 acres in breadstuffs.

The store is kept on the plantation, because the nearest point at which food can be purchased is Charleston, forty-five miles distant, and to make this journey as often as necessary and carry on the plantation would have been an impossibility. Subsistence has been sold at less than cost, and there is no cheating going on.

The inspecting officer and his superior, Major Cornelius, pronounce the plantation government excellent, and the reports to the contrary are denounced as false. It is emphatically denied by the agent that corn was ever sold in the store or on the plantation, or to any of his laborers or resident negroes, or to any negro whatever, at the rate of three dollars a bushel, and he asserts that one day's faithful labor under the contract would furnish the laborer "with provisions from the plantation store, at the highest rates ever charged, sufficient to maintain him two weeks."

The case of Mr. Towles we do not find touched upon in the reply to the *Herald* and the two generals, but it is not an omission which need affect our opinion of Mr. Underwood. The commissioners very signally fail to ruin his reputation as an honest man and a just employer, and he will derive more than a private gratification from knowing that, in easily vindicating his own character, he has done something to rescue a public institution from reckless aspersions.

A NEW RELIGION.

In the last chapter of "Les Apôtres," M. Renan, in support of his assertion that the readiness to endure martyrdom for conscience' sake is not confined to any age or sect, cites the terrible tragedy which took place in Teheran in 1852, when the visible remnant of the "Babist" sect was slaughtered to the last child. Probably few of his readers in this country have ever heard of this sect before, or know more of it than can be gathered from his brief mention of it. But its history is curious and instructive.

An extended account of the origin and career of the new religion, and an exposition of its doctrines, derived from a volume by the Count de Gobineau, entitled "The Religions and Philosophies of Central Asia," has been given in a recent number of the "Revue Moderne." It possesses great historical and psychological interest.

About the year 1843 there lived at Shiraz, in Persia, a youth hardly nineteen years old named Mirza Ali Mohammed. From his childhood he had shown himself passionately addicted to religious thought and novel ideas. He was acquainted with the Christian Gospels, frequented the society of the Jews, sought out the Guebers, the ancient fire-worshippers of Persia, and read with interest the books which treated of occult sciences and the theory of numbers. A visit to Mecca, instead of bringing him back to Moslem ideas, had an exactly opposite effect, and it is believed that it was at the very foot of the Caaba that he resolved upon the destruction of Islam.

On his return to Shiraz he commenced to read his first writings to the companions of his pilgrimage. The new prophet joined to physical beauty great simplicity of manners and sweetness of character.

The spell of his speech and his personal appearance is established by the unanimous testimony of all those who have known him. The appearance of the new prophet made an immense impression at Shiraz. Crowds flocked around him to hear him. In the day he preached in the mosques and the schools; in the evening, in the retirement of his own room, he initiated chosen members of his followers into the secrets of the new doctrine. He adopted the name of the *Bab;* that is, the gate through which alone truth is to be reached. In his first discourses his attacks were directed principally at the vices of the Moullas, the Moslem clergy. The popularity which he gained by these attacks; the victories which he gained in public discussions with the Moullas; the apparent fear of the royal government to engage in a contest with him, and the increasing number and enthusiasm of his disciples, soon led him to take a still greater step. Instead of the *Bab*, he now declared that he was the *Point;* that is, not merely the gate but the very creator of truth, no longer a simple prophet but a living manifestation of divinity. The title of the Bab was now conferred upon a priest of the Khorassan, Moulla Housseïn Bousrhewich, who now became the active chief and soon the warrior apostle of Babism. Moulla Housseïn was sent by his spiritual chief on a missionary tour into Irak and Khorassan, taking with him the writings of his master. He went first to Ispahan. There, and at Kashan and Teheran and throughout the Khorassan, he made a great sensation by his preaching. Another missionary apostle in the meantime met with great success in the Mezenderan. A third missionary was a woman, one of the most striking apparitions that have shed lustre upon Babism. She possessed at the same time extraordinary beauty and, in the midst of all the adventures of her public apostleship, unquestioned purity of manners. Her eloquence is said to have equalled her beauty. She had abandoned everything—parents, husband, home—to devote her body and soul to the propagation of Babism. She had cast aside the veil which custom and religion impose upon women in Persia, and preached the abolition of veiling and of polygamy. The remembrance of the enthusiam she inspired is perpetuated in her popular name of Gourret-Oul-Ayn, the Consolation of Eyes.

In the Khorassan, Moulla Housseïn got into a mêlée with the royal soldiers. After some slight affrays he withdrew with his followers to the district of the Mezenderan. Here, about the year 1848, he was joined by the other missionaries and their followers, and at a place called Sheik Tebersi the Babists built, as a centre of operations and a place of retreat, a huge tower of wood and stone, and provided it with everything needed for a protracted siege. And now, fired with ambitious hopes, they mingled with their religious preaching political predictions, in which the advent of the Bab as universal sovereign was announced as near at hand. Proclamations scattered among the crowds that had gathered around the fortress declared that it would take only one year to decide the struggle, and after that period the entire world would belong to the Bab. They were led to believe that those who died fighting for the new faith would rise again in the flesh, to become kings and princes of some of the countries over which the Bab would continually extend his sway. By such excitement the credulous multitude were wrought up to the very highest pitch of zeal. Two large armies which marched out, confidently expecting to crush the hated Babists out of existence, were surprised by midnight attacks and utterly routed. A third expedition, though it succeeded in withstanding the nocturnal sortie of the Babists, and in mortally wounding the Babist chief, Moulla Housseïn, retired without waiting for a second attack. Reinforced, the royal army again advanced to the Babist fortress, and commenced to build a wall of investment, and to raise towers to overtop the walls of the Babists. The Babists tried another rally, but were repulsed. For four months they held out without any sign of wavering and discouragement, in spite of the most tremendous odds against them, constantly replacing with new works the battered-down fortifications. At last famine reigned. To such extremity were they reduced that the body of the sacred horse of their dead leader, which they had buried with respectful obsequies, was disinterred, and the remnants cooked with the marrow of its bones. Finally they tried to break out and force their way through the enemy's lines. But they were overpowered with numbers, and when they at length surrendered only 214 were living. The survivors were at first treated kindly. But the next day the Mohammedan chiefs invited the principal Babists to a breakfast, then had them seized and put to death by ripping open their bowels. The other Babists, women, children, and even those who had thought they would save their lives by renouncing their heresy, were all put to death, to the great glory of Mahomet and Islam.

But this victory did not succeed in crushing out the Babist heresy. In Khamseh, by another insurrection, the Babists gained possession of Zendjan, a city of immense riches, and again the royal power succeeded in reducing the place only by the greatest efforts. The fanatical enthusiasm and the headstrong courage that was shown at Sheik Tebersi was again exhibited at Zendjan, and Babism was again baptized in a sea of blood. One of the strange relations connected with this period is that of the three Babists who were condemned at Teheran, by the cruel Emir Nizam, to see him open their veins, and who predicted to him that he would one day die by the same death, which did, in fact, happen four years afterwards.

Meanwhile Ali Mohammed, the founder and spiritual head of Babism, had been living in semi-concealment in his house at Shiraz, buried in his religious meditations and compositions, and like a stranger to these external developments of his doctrines. After the insurrection of Mezenderan he was arrested and brought before a court of royal commissioners and the principal Mohammedan priests. In the examination and discussion which took place, according to the admissions of the Mohammedans themselves, the Bab, as he was still popularly called, gained the advantage. Seeing this, the discussion was abruptly broken off, and the Bab, with two of his disciples, was condemned to death, which was inflicted the next day, with the accompaniment of every kind of indignity, and one strange incident that came near giving a new turn altogether to affairs. After his death, his body was trailed round the streets for several days, and then thrown into a sewer. Everything now seemed to be finished. But nothing was finished. The new Bab, Mirza Iaia, whom the seal of a divine mark had pointed out at the age of fifteen as the predestined successor to the office, established himself at Bagdad, where he lived in safety, and kept up permanent communication with his followers, through the pilgrims to the shrines there. The Babists were now forbidden from making any more attempts at insurrection until the Bab should decide that the hour had come and should give them the signal.

In 1852, soon after this, an attempt was made to assassinate the King, but failed. The attempted assassins were recognized as Babists. They obstinately denied, on examination, that they had accomplices. Yet a plot was suspected. A secret meeting of the principal Babists was discovered. Forty were arrested, among them the feminine apostle, Gourret-Oul-Ayn, the Consolation of Eyes. No other capture could be made. No symptom of insurrection was revealed. Nevertheless, the deepest anxiety reigned at the court of Niaveran. The air was full of suspicions. There was vaguely felt the existence of a vast plot, whose ramifications immeshed everything, and the clew to which had broken in the hand the moment it had been seized. The prisoners were examined, but all, women and children no less than the men, showed the same inflexible firmness in keeping the secret. The kalenter, Mahmoud Khan, to whom Consolation of Eyes had been given to guard, charmed with the beauty of his prisoner, tried to persuade her to save her life by a pretended abjuration. But she would not buy life with a lie. Already she thirsted for martyrdom. She told the kalenter that tomorrow he would set fire to her funeral pile, and she would give by her death a striking testimony to God and the founder of her faith; but that his master would not recompense him for his zeal, but would soon put him also to a cruel death. The next day she publicly confessed her Babism, was burnt at the stake with insult and indignity, and her ashes were scattered to the wind. The prediction which she made to the kalenter, a prediction as unhesitatingly credited by her opponents as her followers, was soon fulfilled. The rest of the prisoners were distributed each to a courtier as his especial victim. Then was seen at Teheran a sight never to be forgotten. Through the streets, between the lines of executioners, marched men, women, and children with burning splinters flaming in their wounds. The victims sing: "In truth we come from God and we return to Him." A sufferer falls in the road; he is raised by lashes and bayonet thrusts. On his legs again, he peals

forth again his song. The children expire in the way. The executioners fling their bodies under the feet of their fathers and mothers, who walk over them without scarcely a glance. Thus they arrive at the place of execution, and, in the midst of the profound silence of the crowd, the bloody drama is finished. Nothing had shaken the firmness of the condemned. Not an apostate had been found among them.

And now let us turn from the history of Babism to take a view of the character of the religion that has called forth such devotion and such martyrs, which has shaken Persia to its very centre and has threatened, perhaps may yet supplant, Shiite Mohammedanism in that country.

Babism, like Mohammedanism, asserts the absolute unity of God; but the eternal unity, far from shutting himself up in himself, is on the contrary an ever expanding principle of life. It is ceaselessly moving, acting, creating. God has created the world by means of seven words, Force, Power, Will, Action, Condescension, Glory, and Revelation, which words embrace the active plenitude of the virtues which they respectively represent. God possesses other virtues, to be sure, even to infinity, but he manifests only these. The creature who emanates from God is distinguished from him by the privation of all emanatory action; but he is not altogether separated from him, and at the last day of judgment he will be confounded anew with him in the eternal unity. The Babist doctrine of revelation is distinguished by the fact that it does not claim that the Bab has revealed the complete truth, but only as his predecessors, the prophets before him, have done, that portion of truth necessary for the age. The Bab is declared superior to Mahomet as Mahomet was to Jesus, and another revelation, which will complete the Bab's, is announced as coming in the future.

Numbers play a great part in Babism, especially the number nineteen. This is a sacred number, which the Bab declares ought to preside over everything. He would subject all measures of space and time to divisions and groupings by nineteen. He introduces the same principle into jurisprudence and commerce, and founds upon it his sacerdotal organization. Originally, he says, the Unity was composed of nineteen persons, among whom the highest rank belongs to the Bab. All the prophets who have appeared are, like the world, manifestations of God; divine words; not God, but beings who come from God more really than common men. By them, an uninterrupted relation is maintained between the Creator and the creature. At the death of a prophet or a saint, his soul does not quit the earth, but joins itself to some soul still in the flesh, who then completes the work which was carried on during his life by the prophet who has just disappeared.

Babism enjoins few prayers, and only upon fixed occasions, and neither prescribes nor defends ablutions, so common in the religious rites of Mohammedanism. Divine service is to be celebrated with great pomp, with music and singing, but only rarely. All the faithful ought to wear amulets and put entire confidence in them. Mendicancy, so much in honor among the Mussulman people, is forbidden, and the wearing of rich clothes and precious jewels recommended. One of the best features of Babism is its regard for women. They are ordered to discard veils. Husbands are commanded to be prodigal of everything which can add beauty to their wives' appearance. It is enjoined that women share in the intercourse of social life, from which Persian usage unfortunately excludes them. The tenderness which the Bab shows for children in his writings also shows that he aims, by the reorganization of the family, to fill up the great void in Asiatic life.

As a social theory, Babism would establish a theocracy in which the sacerdotal power should control everything, and by spiritual government create material well-being—would realize, in its own Oriental way, some of the dreams of European socialism. The re-birth in this system of the mystical fancies and many of the puerile superstitions of Oriental antiquity, in combination with some of the most modern and most advanced ideas of the Western mind, is a very curious spectacle. What will be the future of Babism it is difficult to tell. Since 1852 it has changed its character to a secret doctrine, which recruits its disciples in silence. The same Babists who before suffered martyrdom so courageously rather than deny their religion, now, obedient to the new order of their chief, conceal their faith with Oriental dissimulation, and deny it, if need be, without hesitation. Babism is much more in harmony with the subtle and imaginative genius of the Persian people than the Shiite Mohammedanism. The growing spirit of nationality makes their present religion and the present dynasty, both of which were established among them by foreign conquest, less and less acceptable every year. The hour when the Bab shall send word from Bagdad that the time has come for the Babists to take up arms again will be a very critical one for the present dynasty of Persia and for Shiite Mohammedanism.

A RETROSPECT.

[FROM THE "PATAGONIAN TIMES," JUNE 8.]

NOT the least singular feature in that remarkable submerged city, whose discovery and identification with the former metropolis of the United States was described in a recent issue, must have been the spectacle presented by a New York belle of the year 1866, as we find her portrayed in such fashion-plates and comic periodicals as have escaped the destroying action of the waves. Let our fair Patagonians picture her advancing along that Broadway whose remains after so many years of submergence, and imperfectly seen as they are even from the best of our diving-bells, still attest its magnificence,—picture her, I say, advancing with measured march to the click of her little boot-heels, head slightly bent, elbows stiffly out, shoulders held high and square, and eyes fixed on vacancy, as was then the mode. From her waist depended a light, tilting framework of fine steel springs, and shaped like a bell, supposing the bell to commence about the hips, and the lower part, a little above the ankles, to have attained the enormous circumference of four or five yards. This was barely covered by a garment of white or striped stuff, elaborately embroidered, flounced and ruffled on the edge, corresponding to the plainer article known in Patagonia as the petticoat. Over the petticoat was festooned high a second skirt of the costly materials then in vogue; and as, at the distance of a few paces, the feet and ankles of the wearer became distinctly visible under this huge tilting cage to all whom they might concern, there were worn high kid boots, daintily fitting and coquettishly scalloped and tasselled, a method of meeting the difficulty possibly more satisfactory to the New York than the Patagonian mind. For difficulties occurring at a few paces further, or supposing the lady on an eminence—but there are cases that are not supposable, as where ladies incautiously leaned against doors, windows, or counters, or entered one of the narrow public vehicles known among them as "omnibuses," squeezed their way into a pew, or up the aisle of a railroad car, or were caught in a jam, or at the top of the long flights of steps common to their city, the light steel frame, under pressure, instantly resolving itself, for the benefit of an awe-struck sidewalk, into a huge triumphal arch, front, rear, or lateral, as the case might be—facts of which our countrywomen may easily convince themselves by a few personal experiments with such of the best preserved specimens as we have forwarded to the Patagonian Museum. As crowds, narrow passages, flights of steps, and rising grounds occurred in this as in every other city, the stately march of the Broadway belles must have been a series of triumphal arches: a poem of rounded contours, arched insteps, dainty fitness, and snowy Balbriggans very gratifying to any one but the father, husband, brother, or lover.

Above these incautious skirts there was worn about the shoulders a garment, short or long, loose or closely fitting, the shape being left to the caprice of the wearer, the fashion of the day exacting only due observance of its fundamental principle—beads—for which this people displayed a barbarous fondness, and which their ladies wore on their skirts, cloaks, ribbons, veils, fans, parasols, and even about their necks and heads. Fancy, then, on the back of the cloak or mantle, a knot and ends of ribbon, bead-besprinkled, and streaming almost to the feet; add chains, clasps, and cameos, wherever a Patagonian lady would consider it impossible to wear them; suppose one of those heads which, after her feet, the New York belle most delighted to adorn and display, and take your choice, for incredible were the number of coiffures, that changed faster than the moon! The hair was drawn away from forehead and temples, it was combed over cushions, it was raised in tiers of rolls, it was piled high in crinkled waves, blonde or black, though blonde was most affected. Little curls fell over smooth white foreheads, long curls nestled behind the ear, short curls lay audaciously and impossibly on the tops of lovely heads, or drooped over hair massed in a knot at the back, and held in a curious little silken net that could not always escape the inevitable bead, as our ladies will observe in the specimens that we find, together with some of the false hair so extensively worn, and the chains, cameos, gold bands, stars, arrows, butterflies, and embroidered ribbons with which these heads were heavily adorned.

Let the coiffure, then, be in crinkle or curl, as you will, only taking care

that it stand well up from the forehead, and exhibit at the back a knot like an overgrown door-knob; surmount it with anything you like for a bonnet—any of the round hats then worn indiscriminately by men and women: an inverted vegetable dish, soup-plate, or colander, of chip or rice straw; a bit of lace, resting between front and back hair, like a saddle between the humps of a dromedary; or a bunch of flowers tied on the head by wide ribbons—all being worn by the ladies of 1866, and exhibiting, if we may be forgiven the heresy, in spite of grotesqueness, a grace not so apparent in the more solid Patagonian structure. Place a baby's parasol in the hands of the lady so attired, and you have, complete, a belle of that day, as we find her continually reproduced in its current literature.

Indeed, men seemed able to talk and write of but little else. If they set gravely out for some scientific end they paused at the very beginning to administer a warning admonitory fillip to those aspiring women who might follow too closely on their track. From whatever altitude they started, we are tolerably sure to find them tripping over a satin train, or gravely discussing a *chignon* before the end. Alternately they praise and scoff, admire and revile, and, looking at them from the higher point of these later days, we discern causes for this masculine unrest and vague alarm, which they felt rather than comprehended, and find in them a warning for ourselves, for, as straws show the current, so might the first hesitating attempts of feminity on the masculine wardrobe have indicated to this doomed race the future bent of their feminine world. Mark well the art of the fair destroyers! They ventured upon the boots and were not repulsed. They took unto themselves the collar without opposition. They adopted the shirt-bosom, and no man lifted a dissentient voice. They helped themselves to a modified form of hat, and men only stared. Growing bolder, they seized on the sack-coats, flimsily disguising the offence with pretences of galloons and buttons; and, finding man still tame, still passive and stupidly admiring, they possessed themselves of the cravat, the pockets, the coat-tail, and all the other hats, in rapid succession, till it was no longer easy, at first blush, to discern a man's head from that of a woman. Here and there a far-sighted man might lift up a warning voice—on paper—talk of imports and exports, dissect all this current beauty, tell where it was bought and what it cost—but still on paper; for confront the saddest, wisest, and grimmest of these susceptible Manhattanese with the lovely consumer of imports and devourer of gold, and though her gown rustled perfumed defiance at his statistics, and his senses assured him that curls could not crop out from her head where he saw them, though he tumbled over her train in the drawing-room, and started aghast on the street at the skirts that made such a failure of covering her legs, at the bonnet that was no excuse for the strings under her chin, at a bow in the only place where it could not possibly tie anything, and a veil that hung anywhere except over her face—spite of these things, we say, would his growl be lost in his throat, his scowl relax to a simper, and he himself stand before her dazzled, confounded, and conquered.

It is supposed that women finally gained entire predominance, and that when men seriously mooted the question of resistance, that resistance was already too late. Little is known, however, of the latter days of this ill-fated island. Some asserted that the race perished to a man in the attempt to supply their women with pin-money, the women dispersing with grim satisfaction to overrun other hapless races; but this version makes no mention of the submersion of the island, for which others account by a Manhattanese superstition known as "up-town," gravely asserting that as this people, firmly believing in the superiority of their city to the rest of the globe, each and all refused to emigrate, and as every woman of fortune or fashion likewise stoutly insisted on living in the small but consecrated section known by this name of "up-town," the frightful and ever-increasing preponderance of humanity on this favored end of the island finally tilted it over in its own bay. More reasonable and better accredited accounts assure us that for many years previous to the catastrophe, the gradual lowering and wearing away of their island had been observed with uneasiness by the Manhattanese, who appointed a committee of investigation; but, unluckily, the committee being paid for each sitting, met every night for fifteen or twenty years without arriving at any definite conclusions, and were still in process of investigation when the island went under—a catastrophe, due, as we need not remind our logical countrywomen, to the bands, crescents, false curls, ribbons, steel frames, and other feminine extravagances now on exhibition in our museum; since, could the Manhattanese have taken time from the making of pin-money, they would have overlooked the committee of investigation, appointed an acting board, built breakwaters and levees, and possibly saved the island, of which now only so much is left as will make a warning hardly needed, we are proud to say, by our more favored land in these our more enlightened days.

DOES ANY ONE TELL THE TRUTH?

[The subjoined article has been furnished us by a valued contributor, but we hesitated for some time about publishing it, fearing that it might cheer and assist that innumerable company who are engaged in justifying either to themselves or the public the practice of daily lying to which they are addicted. We do not, however, feel warranted, whatever the consequence may be, in withholding a contribution to the philosophy of any subject whatever, even that of mendacity.—Ed. Nation.]

It is a striking and suggestive fact that the first great moral code promulgated to the world contains no prohibition of lying. It forbids in the most sweeping manner idolatry, profanity, murder, theft, adultery, and other sins; but it does not say to man in general terms that he shall not lie, but only that he shall not bear false witness against his neighbor. A special form of deception is the only one that falls under the interdict of the code proclaimed amid the thunders of Sinai.

Various profound and highly philosophical explanations have been given of this fact. The chief difficulty with them all is that they are not true. For this element of truth, however unimportant in other philosophical investigations, is important in this particular one as being the very matter under discussion.

Yet the explanation lies on the surface. Moses was too wise a law-giver to attempt impossibilities. He did not prohibit lying for the same reason that he did not prohibit slavery; for the same reason that nowhere in the Bible is polygamy directly prohibited. A sweeping law against any of these would have been the veriest dead letter. For in each case it would have been so far in advance of the moral sentiment of the people expected to obey it, that it not only would never have been looked upon in the light of an obligation, but would not even have served as a protest of the higher nature against a custom and practice it deplored but could not prevent.

The case is by no means peculiar. There are myriad forms of cheating and robbery even now tolerated among us, unprohibited by statute, simply because the moral sentiment of man is not yet highly enough cultivated to treat that as illegal which is generally regarded as dishonorable. Yet the latter feeling is a proof of that steady growth of the moral sentiment of mankind which has been going on since the creation. It is everywhere apparent. The habits and customs of one age are looked upon with disfavor in another, and become objects of legal prohibition in still another. It is hard to tell, in consequence, how much our view of the morality or immorality of actions and institutions is due to education and how much to nature. That the former can lead men living at the same period, and equally cultivated and equally conscientious, to entirely contrary conclusions has been clearly manifested in our own history. It is within the memory of all that slavery was regarded by good men at the North as the sum of all villainies; by good men at the South as the consummate flower of modern civilization. Right and wrong may be always the same; but our ideas in regard to them change constantly. There is nothing to show that Cain had any of that horror at the murder of his brother which we feel for him. Human life was no more sacred in his eyes than it is now in the eyes of a South-sea islander or a railway director. Doubtless many a tender-hearted boy now feels more compunctions of conscience for drowning a kitten than the first murderer did for spilling the blood of his brother. Remorse was a feeling very probably unknown to the antediluvians.

All kinds of deception are practised without scruple in rude and barbarous states of society. Centuries pass by, even under the best religious training, before men learn to put faith in one another. And it was, unquestionably, on account of the low moral development of the Israelites that Moses made no prohibition of lying, except so far as it affected the property or reputation of others.

Four thousand years have gone by since his time, and is the world yet prepared for such a prohibition? Most men will say yes; for absolute truthfulness is a duty positively enjoined in all philosophical treatises upon the morals, and many good, though unreflecting, persons labor under the delusion that they have quite or almost attained to it.

Never was there a greater mistake. In the present state of mankind a man absolutely truthful is not only an impossibility, but, were he not only a possibility but also a reality, he would be a moral monstrosity—worse than that, a bore, a breeder of quarrels, a general nuisance which society would feel called upon to abate for the sake of its own safety. Few appreciate how much we owe to falsehood, how much our daily life stands in need of it. Without the lubricating oil of deception, the friction of the social wh would soon bring on a general social conflagration.

These are grave statements. Are they true?

What is the essential idea of a lie? Is it anything else than an intentional effort to produce a false impression of a given fact in the mind of another? It makes no difference whether the deception be caused by an unblushingly untrue statement, by a certain course of action, by equivocation, by evasion, by the use of ambiguous words and phrases. Nor does the goodness or badness of the end aimed at come into the question. If deception was produced, and produced intentionally, it was produced by nothing more and nothing less than a lie, however praiseworthy the motive, however innocent in themselves may have been the words used or the deeds done.

Will morality accept any lower standard? Yet tried by it, who does not lie?

The ordinary rules of politeness require us constantly not only to hide our real sentiments from those around us, which may be strictly consonant with absolute truth, but also to convey to others in many cases an entirely false impression of those sentiments, and that, too, in matters in which they are concerned. It is a law of society which, like the air around us, presses so generally and so equally that we do not heed it. We live and move, indeed, in an atmosphere of deception so thick, so heavy as not only to hide us from our neighbors, but frequently to hide us from ourselves; so that from constantly striving to persuade others that we think and feel differently from what we do think and feel, we sometimes succeed in convincing ourselves that we are what we endeavor to seem to be. We receive with courtesy those whom we heartily dislike, and treat with respect those for whom we feel profound contempt. It is right that we should do so; it is wrong not to do so. But so far as our acts and words are intended to give, as they necessarily are constantly intended to give, our neighbors an entirely wrong impression of our feelings towards them, so far those words and acts cannot be brought into accord with the rule of absolute truthfulness.

Every one has doubtless met occasionally people who pride themselves on always speaking the truth, especially truth that is disagreeable; who boast that they always strive to be frank, but forget that they generally succeed in being also brutal. Society ostracizes, as far as possible, such persons, and very properly; for it knows instinctively that perfect and universal sincerity, in the present moral state of mankind, would bring us back to a condition as deplorable as that barbarous one of universal lying, out of which we have slowly raised ourselves. It is regarded, indeed, not only as a proof of high breeding, but as a kind of triumph of Christian politeness and cultivation, to remove unpleasant impressions produced upon the minds of others by the awkwardness or carelessness of some blundering truth-teller—in short, to substitute falsehood for fact. The proverb that the truth should not be spoken at all times is simply an expression of that instinctive popular appreciation of the necessity of deception which all men feel, though in it few dare avow their belief.

And yet our modern philosophers, with these facts of every-day life staring them in the face, hold out before us absolute truthfulness not as a standard of ideal right, to be aimed at though incapable of realization, but as a duty possible in attainment and obligatory in practice. But when they come to test their general propositions by particular illustrations, they unconsciously betray the weakness of their position. For example, take a question much mooted in casuistry, and of especial interest to men of letters, as involving their right to deny the authorship of publications which have appeared anonymously.

Dr. Johnson once said that he did not believe Burke wrote the Letters of Junius, because the latter, of his own accord, had told him that he did not. But Johnson went on to say that had he himself asked the question in the first place, and met with a denial, he would have still been unsatisfied; as he would have regarded it as the right of a person interrogated on such a point to return a negative answer, whatever might be the actual facts in the case.

This seems the common-sense view, and is certainly the common practice. But the right of an anonymous author thus to keep his own secret is absolutely denied by our modern moral philosophers. Here is the very manner in which the case is treated of by one of the ablest of their number, who admits that a refusal to answer would, in many cases, be the same as an answer in the affirmative. "The author has no moral right," says Dr. Whewell, "to remain concealed at the expense of telling a lie; that is, it is not right in him thus to protect himself. But, on the other hand, he is not bound to answer. Nor need he directly refuse to do so. He may evade the question or turn off the subject. There is nothing to prevent his saying, 'How can you ask such a question?' or anything of the like kind that may remove the expectation of an answer." Whewell then goes on to say that if these means fail, either through the persistence of the questioner or the unskilfulness of the questioned, the latter is bound to confess the fact rather than deny it directly. And this is the generally accepted view.

It is not enough that this monstrous doctrine denies the right of secrecy, which is just as much a natural right as the right to know the truth; and that the same principle, carried out in all the matters of life, would place every man at the mercy of any impudent questioner whose social standing forces the questioned to answer with the tongue what can be only answered properly with the boot. All this is not enough. For the advocates of this doctrine, shrinking from the logical results of their conclusions, teach a direct violation of truth, while pretending to assert its claims.

For Dr. Whewell, like others, while gainsaying the right of an author to make a direct denial, in this case admits that he may ward off the attack upon his secrecy in the best manner he can; he may parry the question, he may turn the conversation, he may make a non-committal answer, yet it is perfectly plain that if any of these evasions succeed, they succeed because the questioner is deceived. He fancies that he has been answered in the negative, when he has not been answered at all. It is perfectly plain that all the effect of the most barefaced lie has been produced, and has been produced intentionally. But it is not so plain that evasion for the purpose of deception is morally any better than an unblushingly false statement for the same purpose. If there is any choice in the matter, the latter would seem the manlier sin of the two.

There seems to be, in fact, no escape from the conclusion that in the present moral condition of the race, perfect truthfulness is not attainable, and if attainable, not desirable; that the difference between one man and another in the matter of veracity is a difference in degree and not in kind; that truth-telling is a relative, never an absolute characteristic of any man, and that consequently we are all more or less liars. Yet the race steadily, though slowly, approximates to the ideal of absolute right, and though no one can tell all the truth, or tell the truth at all times, though no one is morally bound to do so, yet every one can speak, and is morally bound to speak, the truth, so far as its laws are recognized as obligatory by the men of his age. But let not philosophy torture him, if he is both conscientious and thoughtful, by holding out rules of duty to which he feels he cannot conform his life; or deceive him, if he is conscientious and thoughtless, by leading him to believe he has attained a height which it is not possible, and never will be possible, for him to reach. For, as in mathematics, the line called the asymptote may eternally approach the curve of the hyperbola, and yet never meet it, so in his history man may for ever approach the ideal of abstract truth and yet never realize it. He who never lies belongs not to the present time, but to that good time coming of which we hear so much but see so little. Now, he would be as much out of place as he who never says anything but what he thinks, or he who never preaches what he does not practise. L.

Correspondence.

THE AMERICAN LECTURESHIP AT CAMBRIDGE.

To the Editor of The Nation:

Sir: I wish to offer a few remarks on Mr. Goldwin Smith's letter, which appeared in The Nation of May 18. From November, 1860, to June, 1861, I was a fellow-commoner at Trinity College, Cambridge, and enjoyed every opportunity of studying English college life among both dons and undergraduates, at a time when the eyes of the civilized world were anxiously fixed upon this country. As one of the three American students in the university, I was constantly questioned as to American affairs by both Union and rebel sympathizers, nearly all of whom displayed gross ignorance and not a little dogmatism while discussing the questions at issue.

I feel very confident that an American professor at Cambridge could do a great deal of good. He could, by associating with the younger and more liberal-minded dons and the older and more mature undergraduates, excite an interest about our national and individual life, in all its varied aspects, that would soon bring large and attentive audiences to his lecture-room. In addition to other gifts, he should possess decided social talent, and the salary attached to his office should be sufficient to enable him to entertain in thoroughly good style. Cultivated Americans travelling abroad would enjoy in his *salons* the society of scholarly Englishmen, they themselves bringing a quota of young ideas fresh from the young country. To such a professor students would come to borrow books and gain information who would never take the trouble to search through an immense collection of miscellaneous works in a public library. Students cannot be expected to learn much about America or on any other subject without teachers as well as books.

Considering the close connection between the university and the church, it would be almost essential that the American professor should hold religious views not opposed to the teachings of the Church of England, and, if any collegiate corporation in this country participated in his nomination, would be highly expedient that it should be an "orthodox" body.

E. C. P.

A Feast for Epicures.

BY "J. B.," OF THE ROUND TABLE.

LEYPOLDT & HOLT, Publishers,

451 Broome Street.

To Owners of Libraries.

Messrs. LEYPOLDT & HOLT (451 Broome St., N. Y.) have in preparation a work of great importance which, it is hoped, will supply a need long felt by students and book-collectors. It is a

THESAURUS OF ARCHAIC ENGLISH,

by Prof. Hiram Corson, Editor of "Chaucer's Legende of Goode Women."

This work has grown out of an undertaking by the author to produce a complete "Glossary of Chaucer's Canterbury Tales," with occasional notes on other important early English works. The book grew upon his hands until, after seven years of devoted labor, he has produced a work which is believed to contain an exposition of every archaism worthy of note in English literature.

The importance of such a work will be appreciated by a highly-cultured class, but by them alone. The number of such is small, and it is therefore deemed expedient to publish the work by subscription, and not to publish it before enough subscribers are secured to guarantee the financial safety of the undertaking. Beyond that, the publishers entertain no expectations. It is proposed to issue a Subscription Edition of about 850 pages, in quarto, on large paper, with a printed list of subscribers' names, at $15 a copy. The list already contains many of the leading names in American literature.

Persons wishing to expedite the publication of such a work, can obtain specimen sheets and prospectuses on application to the Publishers.

ROBERT H. JOHNSTON & CO.,

FINANCIAL REVIEW.

NATION OFFICE, Thursday, June 21, 1866.

THE panic in the gold market, which on Monday drove up the premium to the neighborhood of 170, has subsided. Gold has been as low as 148½; to-day at 3 P.M. it stands at 150¼. At least one of the leading bulls of the gold room has failed, and others, where default has not been announced, have suffered very severely. Heavy losses have likewise been endured by merchants who had sold gold short with a view to protect themselves against a decline in merchandise; on the one hand they have had to pay out large sums on their sales of gold; and on the other, merchandise having failed to respond to the rise in the premium, they have lost on that too. So uncertain must all kinds of commerce prove while we are on a currency basis. On Tuesday the advance in gold checked the inquiry for bills, and large amounts having collected in second hands, prime bankers' fell to 180. At that figure there is a partial revival of the inquiry, on the decline in gold to the neighborhood of 150. But shipments have naturally been checked for the present. They will not be renewed unless the bears in the gold room should force down the premium to the figures of April last, or the fall importations should prove heavier than is anticipated. Congress is investigating the subject of Mr. McCulloch's recent gold and stock operations. It would seem from a letter written by that functionary to Congress that he has been operating not only in gold but in ten-forties, seven-thirties, and five-twenties, buying as well as selling, of course for the account and risk of Government, with the public money, and with the knowledge only of certain privileged firms. This calls for inquiry and reform.

Money is a drug at 5 per cent. The banks have been turning their gold into greenbacks, and the accumulation at this point is very large indeed. Nothing further has transpired with regard to the proposed 5 per cent. funding loan; the impression is that the scheme will be abandoned, and that the Secretary will be left with powers substantially the same as those which he now possesses.

Speculation has for the time deserted stocks for the livelier arena of the gold room. More than half the railway stocks on the list are what is called "cliqued;" that is to say, they are held in large blocks by cliques at prices which are generally considered too high. The public will not buy them, and dare not sell them short for fear of corners. This is the case with New York Central, Hudson, Reading, Michigan Southern, Pittsburgh and Fort Wayne. The bulk of the transactions reported in these stocks are understood to be for the members of the various cliques. Erie has been active as usual. The short interest is so large that a few leading holders by refusing to lend their stock have made it scarce again, and it has been loaned at 1-32 and 1-16 per day. The long-expected dividend of 5 per cent. has been declared on the Reading. Governments are all higher, on the rise in gold. Five-twenties have sold at 103½. With gold even at 150, no large amount of foreign bonds can be imported from Europe except at a loss, which the foreign holders will not care to incur.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	June 14.	June 18.	June 21.	Advance.	Decline.
United States Sixes of 1881	106	106	106	....	....
5-20 Bonds, old	102¼	103¾	103¾	....	¾
5-20 Bonds of 1865	102¼	103	102⅝	....	⅜
10-40 Bonds	96¼	96⅝	96⅝	....	....
7.30 Notes, second series	102¾	102⅝	102¾	⅛	....
New York Central	98¼	99¼	99	....	¼
Erie Railway	59⅛	59⅛	58	....	1⅛
Hudson River	110	110¼	112	1¾	....
Reading Railroad	109¼	109¼	109	....	¼
Michigan Southern	79	78¼	79¼	⅛	....
Cleveland and Pittsburgh	82¼	83¼	85	1¼	....
Chicago and North-western	30¾	30	30	....	....
Chicago & North-Western, Preferred	59¾	59	59	....	....
Chicago and Rock Island	91½	93¾	95¼	1½	....
P., Fort Wayne, and Chicago	97¼	97	98	1	....
Canton	58¾	60¼	59	....	1¼
Cumberland	45	44½	45½	1	....
Mariposa	11½	11¼	11½	¼	....
American Gold	147½	158	150½	....	7½
Bankers' Bills on London	109⅞	108	108¼	¼	....

Send for illustrated catalogue or call at the New Warerooms.

GEO. G. SAXE & CO.,
417 Broome Street, N. Y.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their PATENT AGRAFFE ARRANGEMENT, which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.

Topics of the Day.

THE most remarkable incident of the week has been the President's message, reporting his action in the matter of the submission of the Constitutional Amendment to the legislatures of the several States. The document is very characteristic. While the amendment was under discussion he remained studiously silent about it, and now that nothing remains but to secure its ratification by the State legislatures he brings forward his objections to it, of which the principal are (1) that it has not had his approval; (2) that the South was not represented in Congress when it was adopted; and (3) that inasmuch as "the sovereign people of the nation" had never heard of it when they elected the various State legislatures which are now to be called upon to ratify it, the legislatures may be incompetent to express their views. The futility, to use no stronger term, of all this is so glaring, that we cannot help believing that Mr. Johnson's real object in bringing it forward is to impress the South more strongly than ever with the belief that it is foully wronged, and that the passage of this amendment will be a fresh outrage, and that Andrew Johnson is its only earthly friend. In fact, it is what Mr. Johnson himself on one occasion called "an *ad captandum* appeal." His hostility to it might as well have been taken for granted, for, of course, it was not part of "his policy." The absence of the Southern delegates when it was adopted, if it have any value as an objection, would invalidate every act of Congress passed since the first Southern delegate applied for admission and was refused. As regards the inability of the State legislatures to express the sentiments of "the sovereign people" on this subject, we earnestly and respectfully advise Mr. Johnson to let the sovereign people settle their own relations with their legislatures. He is not called upon either by law or usage or the war power to see that the State legislatures express the popular sentiments, and the demands on his time are so heavy already that we fear the addition of this little matter to the number of his tasks would overwhelm him. Besides which, the Constitution nowhere requires a new election of State legislatures for the ratification of constitutional amendments.

THE Committee of Ways and Means has recommended a large increase in the duties on light wines, which, if adopted, will, we are satisfied, be in the long run a serious injury to the wine-growers of this country, whom it is doubtless the object of the committee to encourage, and will do much to prolong the reign of the distillers of spirituous liquors, whose productions are at present an almost unmitigated curse to the community. There is no doubt that America will one day be one of the greatest, if not the greatest, wine regions in the world, but this consummation will never be brought about until the population has acquired a taste for light wines, and this taste it is not likely to acquire as long as good light wines are made artificially dear. At present the national palate, both North and South, is deadened by whiskey, and to whiskey people will stick unless they are tempted into the use of other and better beverages by their cheapness. The high duties on cheap foreign wines really do not benefit the native wine-grower, but the native distiller. The consumers of Missouri and California wines will come, whenever they do come, from among men who have learned to love foreign clarets and hocks and burgundies, and not from amongst those whose only stimulant is Kentucky bourbon and New England rum; and the manufacture of these commodities is one which we hold every legislator to be bound on the highest grounds to discourage by every means in his power.

MEMBERS of Congress now rarely speak on a question of any importance without prefixing to the main body of the argument an enquiry into the practice of the ancients, the facts of which are generally gleaned, no doubt, from "Lemprière's Classical Dictionary" and "Plutarch's Lives." Some speakers get so far back occasionally that they get lost in the mists of antiquity. Mr. Deming, of Connecticut, when arguing in favor of Grant's being made a full general, instituted an investigation into the practice of the earlier Pharaohs, which was of the highest interest and showed clearly that Grant ought to have the place. The other day in Brooklyn, in a libel case in which a local politician named Strong is the plaintiff, the counsel for the defendant, by way of giving the jury a vivid idea of Strong's worthlessness, asked them "to think of Epaminondas and Fabricius, of all the heroes and martyrs who have offered their lives for the cause of mankind," of John Bright and Richard Cobden, and then "to turn and contemplate Strong, *if they could.*" There is clearly a great classical revival going on among our lawyers and legislators, and there is no knowing where it may end. It may possibly produce some good fruits eventually, but up to the present all we have gained by it is the addition to our stock of nonsense of some of the most amusing rubbish ever uttered.

THE Board of Health is now being bombarded with injunctions. Judge Cardozo is supplying this ammunition to the butchers, who insist upon driving cattle through the streets and slaughtering them in populous districts as a heaven-born right, and Judge McCunn supplies it to the liquor dealers. The art of enjoining, which once played a prominent part in city politics, but has lately fallen into disuse, we may now expect to see revived, and the courts kept in full activity during the summer.

MRS. JAMES GORDON BENNETT, who has "borne with calmness the most fearful abuse and calumnies," strangely enough sees fit to publish a card declaring that she did not use her influence to procure a confirmation of Mr. Fleurat's nomination to a consulship. Our sympathies are with the lady if she suffers from the fabrications of the correspondent, otherwise we are at a loss to know why they should have called forth so indignant a denial. Probably nobody believed the story, and

if everybody had believed it, we cannot see that charging her with dabbling in politics, so far as to seek to do a good turn for a friend, is very fearful abuse, though it is doubtless sufficiently impudent and ungentlemanly. But if gross misrepresentations of fact, insinuated lies, imputations of mean motives, are the stock in trade of half our New York and Washington correspondents, and the stuff which they concoct finds its way not only into the daily newspapers, but into the journals of literature, art, and news which profess to take a high moral stand, it ought to be remembered that the commonwealth of journalism owes the disgrace rather to James Gordon Bennett's paper than to any other source.

It is almost impossible to take up a newspaper without finding an account of some terrible murder. A horrifying list of atrocious crimes might be compiled from the record of the last few months in the East, and in the West the very spirit of Cain seems to walk in the woods and fields as well as in the cities. One feels safer to learn that the Connecticut Legislature has reconsidered its vote delaying the execution of Albert Starkweather till a year from the coming fall. That matricide robber has been shamming insanity of late, and people go and look at him and find something very queer in the look of his eyes. He has lucid intervals now and then, and has perfected one plan of escape which involved the murder of a warden, and that he prepared himself for by making a dagger out of a shoe-knife. Had it not been that he was betrayed by a woman of ill repute with whom he was negotiating, the turnkey and the access of his methodical madness would have probably come together some night, and the assassin would have added one more victim to the three or four whom he has killed already.

The last advices from Europe are not of blows, but they are of steps which infallibly lead to blows. Prussia has pushed Austria out of Altona—the only footing she had in Holstein, has dissolved the Holstein estates and arrested the Holstein Government commissioner, and is preparing a new government for the two duchies. Austria, as heretofore, retreats and protests, and finally, being pricked by this last humiliation, withdraws her ambassador from Berlin. She also moves in the Diet that, Prussia having violated several articles of the Federal Pact, the immediate mobilization of the whole Federal army, except the Prussian contingent, be ordered. Prussia gives warning that the issuing of that order will involve the dissolution of the German confederation and her own release from any obligations but those of military expediency. Austria is said to have proposed as a reform measure a parliament elected by the direct votes of the German people, and, as a national executive, a directory of three, the presidency to be assumed in a fixed rotation. Prussia proposes by circular a plan which leaves Austria out in the cold, and by which, among other provisions, the ports and fleets of the new confederation are to be placed under her own control. If we add that the Diet has removed from the Federal ports the troops of both the contending powers, that Austria has called on Switzerland to guard well the Italian passes, that Garibaldi is at Como, that Russia is mobilizing 100,000 soldiers, and that Turkey is preparing to invade the Principalities under the captaincy of Omar Pasha, we have presented all that is now known of the Continental "situation." This view, to be sure, leaves out France and England. The Emperor has written a letter to Drouyn de Lhuys, in which certain *idées Napoléoniennes* are curiously unconcealed. One is, that he never meant to make the Rhine the boundary of France unless he could do so when territorial aggrandizement was going on elsewhere in Europe; another, that the Rhine provinces would be kidnapped only upon their "free and formal vote" in favor of being stolen. In the House of Commons, Mr. Kinglake put some questions to Mr. Gladstone touching England's behavior in the present crisis, and in a remarkably clear and able manner, in which his approbation of the ultimate aim of Italy was not disguised, showed, nevertheless, that Austria had given her no other *casus belli* than that which has existed since the peace of Villafranca, and that, whether she be right or wrong in making an opportunity of her neighbor's necessity, it was for other powers to consider what right they had to encourage her to become the disturbing element of Europe.

CONGRESS.

Wednesday, June 20.—In the Senate, the Committee on Naval Affairs reported, without amendment, the bill authorizing the Secretary of the Navy to accept League Island for a naval station. The reading of the tax bill was commenced.

In the House a bill to increase the pensions of widows and orphans, and for other purposes, was read three times and passed under the "previous question." The bill to aid in the construction of the California and Oregon railroad and telegraph was recommitted. The Senate substitute for the Paris Exhibition bill was taken up by the persistence of Mr. Banks, after sharp opposition by Messrs. Washburne and Stevens, and, the House adhering to its own bill, a committee of conference was appointed.

June 21.—In the Senate, a resolution was passed instructing the Committee on Public Grounds to consider the expediency of purchasing certain lots east of the Capitol for a national park and new Presidential mansion. The tax bill was still further discussed and amended.

In the House, a bill to re-organize the Treasury Department and fix the pay of its employees, reported by Mr. Morrill, was read twice and recommitted. A resolution was passed to investigate certain recent errors in the reckoning of mileage, and to examine the whole subject with a view to a more equitable payment of travelling expenses. The army bill was passed—yeas, 72; nays, 41.

June 22.—In the Senate, page 233 out of 244 of the tax bill was reached. A message was read from the President, submitting a report from the Secretary of State which showed that the latter had transmitted the lately proposed amendment to the Constitution to the executives of the several States. The President took occasion to clear himself of all complicity with the amendment; to complain that it had not been submitted to him for his approval, that eleven out of thirty-six States are unjustly excluded from Congress, that the "sovereign people of the nation" have had no opportunity of expressing their views on the amendment; and to conclude that there are "grave doubts whether the action of Congress is in harmony with the sentiment of the people, and whether State legislatures, elected without reference to such an issue should be called upon" to ratify the amendment.

In the House, a bill authorizing a bridge over the Mississippi at Rock Island was passed. The message of the President was referred to the Committee on Reconstruction. The Indian appropriation bill was passed. Also, Senate bill providing for the revision and consolidation of the United States statutes. The Committee on the Judiciary was instructed to enquire into the expediency of reporting a bill for the direction of United States district judges and attorneys in regard to enforcing the test oath at the South.

June 23.—In the Senate, a joint resolution was passed to provide for an official history of the rebellion.

The House, after passing a number of private bills, adjourned, with the customary resolutions, out of respect to the Hon. James Humphrey, lately a member of that body, from New York.

THE FREEDMEN.

Gen. Scott, assistant commissioner for South Carolina, contradicts the charges of Gens. Steedman and Fullerton against Chaplain French and Lieut. Lott. He denies that these officers are running plantations, or have anything to do with planting, directly or indirectly. As Gen. Scott was especially excepted from the almost indiscriminate censure of the President's emissaries, he must be accepted as a competent witness, even against themselves.

—Superintendent Tomlinson reports 75 schools in South Carolina, with 9,017 pupils, and an average attendance of 6,574. There are 148 teachers, of whom 58 are natives and fifty colored. One other school, from which there were no returns, would swell the number of pupils to 10,000. The interest of the colored people in the schools continues unabated, and that of the white people is growing; yet there are some places where it is said no school could be established, nor tolerated after the garrison has been withdrawn. A very successful public examination of the colored school held in the Normal School building took place in Charleston, May 30th.

—Virginia counts 225 teachers of colored schools and 17,589 pupils, whose average attendance is 12,930. In Florida there have been several cases lately of violence done to teachers. The colored people of Helena, Arkansas, have voted to ask General Sprague to tax them for the support of their schools. Several colored schools have recently been opened in Raleigh, North Carolina, by "colored teachers who are competent, and who were born and raised amongst us," to use the language of the Raleigh *Sentinel*, which is opposed to Northern "school-marms," as it chooses to call them.

—There is said to be a combination of negroes in Cherokee County, Alabama, who have bound themselves not to work for less than $2 per day during the present harvest, under penalty of receiving fifty lashes. If they had only voted to hinder all other negroes from working for less than these wages, they would have been as enlightened as the caulkers and ship-carpenters of the three foremost cities in the Union.

Notes.

LITERARY.

It is one of the special provinces of modern historical investigation to find out the good that can be said about the most maligned characters of the past. The Emperor Napoleon has shown the bright side of Catiline, a learned German, Stahr, has given us a defence of Tiberius, Mr. Froude has set forth the virtues and graces of Henry the Eighth, and now we have an apologist for the Stuarts. Hardly an apologist, however, for Mr. Robert Bell, in his recent paper in the "Fortnightly Review," only aims to state facts that have been generally overlooked in the general condemnation that the two Charleses and James the Second are visited with. The two good and wise actions that Mr. Bell puts to their credit are the foundation of the navy and the establishment of the post-office. At the accession of Elizabeth, the coast of England was entirely defenceless, and liable to be ravaged at pleasure by French and Dutch adventurers. After twenty years of work, all she could raise was twenty-four ships, the largest of only 1,000 tons. In fifteen years James I. added seventeen vessels to the navy of Elizabeth, one of them of 1,400 tons, the largest vessel ever built in England up to that time. Charles I. built still larger ships, and fitted out for sea three complete fleets in three successive years. Notwithstanding the wars, he left the navy in much better condition than he found it. Under the Commonwealth the navy suffered greatly, and the commercial marine became almost extinct. At the Restoration there was a debt on the navy of £374,000, and its bills were at a discount of twenty per cent. Both Charles II. and James II. took great personal interest in the navy, and raised money for it in different ways, even from their private purses. It was only by the faith and perseverance of Charles II. that the navy was maintained at all. But in 1664 an English fleet of one hundred and fourteen men-of-war and frigates, and twenty-eight fire-ships and ketches, sailed for the Dutch coast while the Dutch were still engaged in preparation. In 1672 another English fleet of upwards of one hundred sail was fitted out. The ship-yards were kept constantly at work and ships were always building during both their reigns, and the present maritime power of England is almost entirely owing to their exertions. Up to the time of James I. there was no post in England. All letters were sent by messengers. He instituted first a foreign postal service by which all letters were carried to the Continent. The horse-posts in England were only for Government service, and it was not until 1635 that a letter-post was established between London and Edinburgh. A table of postal charges was introduced, and several branch routes started. From [illegible] the system rapidly expanded, though much opposition was met with at first to the system, which was violently denounced as tyrannical, as it prevented Englishmen from sending letters as they pleased by private hands. The Penny Post was started in 1680 by a Mr. Docwray, of London, and met with great success, when it was seized by the Government and carried on by them. Mr. Docwray was afterward granted a pension out of the post-office revenues, until he abused the position which he held of Comptroller of the District Post, when he was deprived of everything.

—On his return from Rome, after permission to use the Vatican MS. text of the New Testament had been withdrawn, Prof. Tischendorf stopped at Turin to examine the fragments of Ulfilas that had lately been found there. The fragments were only four leaves of parchment that came from the celebrated Ligurian monastery of Bobio, and which, after being for some years in the library at Turin, Dr. Reifferscheidt discovered to belong to the patristic palimpsest in the Ambrosian library at Milan, from which fragments of Ulfilas had been recovered by Mai and Castiglione. The application of Gioberline tincture and other chemicals, however, failed to restore the erased writing so that it could be deciphered. Some words and fragments of words could be seen, but nothing more could be made out, even when the parchment was held up to the light and most carefully examined.

—The first volume of the "Memoirs of Maximilian, Emperor of Mexico," is announced by a Leipzic publisher. It is a reproduction of the account of the Emperor's travels, of which a very few copies, issued from the imperial printing press of Vienna, had been distributed to members of the imperial family and to a few intimate friends, with a request not to publish any extract. This prohibition must have been removed, unless the Leipzic publisher has obtained a copy surreptitiously, and is printing it without the consent of the author.

—The remarkable discovery of Dante's remains at Ravenna last summer was commented on in the papers at the time. It is, however, but recently that the official report of the commission of the Italian Government has been made public. A writer in the June number of the "Cornhill Magazine" gives an account of his difficulties in finding the report. After examinations of all the libraries in Florence, he at last received information that the report was in the office of the Minister of Public Instruction, where, after several visits, he found it. The report was not printed until last fall, and had never been published. It contains full details of the finding of the wooden chest containing the remains, and of the measurement and examination of the bones. The registers of the convent were searched, and all the data obtained that could be of the removal of the bones from the sepulchre, and the reasons therefor. The cavity of the cranium was filled with rice, in order to ascertain the probable weight of the brain. The rice weighed 3.1319 lbs. avoirdupois. The diameter of the cranium, from the occiput to the frontal bone, was thirty-one centimetres and seven millimetres; the transverse diameter, taken between the ears, thirty-one centimetres and eight millimetres, and the vertical diameter fourteen centimetres. On a careful comparison, the mask of the poet preserved in the Uffizi gallery, Florence, was found to be in all respects similar in configuration to the cranium found at Ravenna. The length of the nasal bones agreed precisely, and the same remark applies to all other parts which admitted of measurement.

—The fourteenth volume of the "Etudes Contemporaines" of M. Philarète Chasles has just been published. These studies are a résumé of all the ideas which the author has published during thirty years; they include almost the whole of European civilization. He has neglected none of the great countries and none of the great epochs. M. Chasles is in some sort a literary pioneer. He was one of the first to make the French world acquainted with the literature of other countries, and led the way to a vast number of followers. One chief idea pervades all his fourteen volumes—the difference that separates the Latin and the Germanic races—an idea which governs the development and the contrasts not only of the arts and literature, but also of society, religion, and manners among the two principal groups of people that make up modern civilization. No one has insisted on this difference more than M. Chasles, and no one has better appreciated its consequences. The present volume is specially devoted to the changing details of our manners, and to the variations that contemporary ideas and habits have undergone during the last twenty years. Some of the subjects treated of are: "Woman's part in the family;" "Growth of vice at the large centres;" "Oddities of female dress and the crusade that they have excited;" "Irruption of slang into the ordinary language;" "New condition of literary men."

—The citizens of Rouen are desirous of erecting a monument to Jeanne Darc, and wish to attach to it the celebrated "Tour du Donjon" which belongs to the Ursuline convent of that place. Objections were made to alienating the property of the church, but subsequent investigations showing that it was possible to sell the tower separately from the convent, the Archbishop of Rouen, Cardinal de Bonnechose, has given his consent, and the "Tour de Jeanne Darc" is to become the property of the city of Rouen, and be connected with an expiatory monument to the liberatress of France.

—A very interesting discovery in the history of art has just been made by M. Armand Baschet, a French writer and antiquarian of considerable merit. In searching through the archives of Mantua in order to find, if he could, some details of the life of Rubens at that court, about which little had been hitherto known, he hit on a complete series of letters of Rubens, as well as a number of official documents and papers of the duke, concerning him and his mission to Spain. His name first appears in July, 1601, in a letter of recommendation to the Cardinal Montalto, on his going to Rome to copy some pictures. The most interesting documents are the letters of Rubens himself, descriptive of his journey to Spain, where he had been sent to take some paintings to the all-powerful minister, the Duke of Lerma. He speaks with a freedom and a liberty of speech and idea that must greatly have surprised the functionaries of an Italian court. The details that he gives of the damaged state in which the paintings arrived, and the trouble he had to restore them, are very curious. He succeeded so well that the copies executed at Rome, and retouched by his skilful pencil, were taken for originals of the great masters by the Duke of Lerma, who was in ecstacies over the sumptuous gifts of the Duke of Mantua. These pictures are probably still put down as originals in Spanish catalogues, and the list of them that M. Baschet is going to publish will cause disappointment to their actual possessors.

—Recent announcements by Little, Brown & Co. are "The Character of Jesus Portrayed, a Biblical Essay, by Dr. Daniel Schenkel, professor of theology in Heidelberg, translated by W. H. Furness, D.D.;" the ninth volume of Bancroft's "History;" "Principles of Wealth, a Manual of Political Economy," by Amasa Walker; "Plutarch's Morals," a corrected and revised translation by Prof. Goodwin, of Harvard College; "Old Plays

chiefly from the period beginning with Marlowe and ending with Dryden, with introductions and notes, by Prof. James Russell Lowell," in ten volumes; and reprints of More's "Utopia" and Walton's "Angler." They also announce a new law magazine in the early autumn. Scribner, Welford & Co. announce the republication of a translation of "The Life of Christ," by the Rev. E. de Pressensé, a Protestant minister of Paris, a work which called out a personal mark of approbation from the Catholic archbishop of that city. Gould & Lincoln are about to publish a "Memoir of George N. Briggs, LL.D., late Governor of Massachusetts," by Rev. W. C. Richards. An edition of "The 'Albert-Nyanza'—Great Basin of the Nile, and explorations of the Nile Sources," by Samuel White Baker, M.A., F.R.G.S., has just been issued by J. B. Lippincott & Co.

—Mr. John Meredith Read, Jr., whose "Historical Enquiry concerning Henry Hudson" we noticed a few days ago, has not abandoned his researches in the same direction. One object of printing that *brochure*—a discourse before the Historical Society of Delaware—was to call public attention to his labors, and to obtain information from all disposed to contribute it. He is already occupied in procuring from England copies of rare documents drawn from original sources. From the same quarter, too, we understand, he has hopes of gathering material which will solve two other interesting historical problems, and afford scope for a new volume on a leading subject. Mr. Read's address is Albany, and he will be grateful for any communication of facts relating directly or collaterally to Hudson, his kindred, or his descendants.

EDUCATIONAL.

Rev. Warren Burton, a graduate of Harvard in 1821, whose death occurred at Salem on the 6th of June, was well known in eastern New England for his writings on education and for his labors in various cities and towns to promote the instruction of the young. His "District School as it was, by one who went to it" is a capital picture, full of wisdom and humor, of the old-fashioned country schools, which have done so much for the culture of New England.

Of late years he devoted himself to a very interesting specialty in the broad field of educational labor. Believing that as public and private schools improved in character, and as teachers became more and more skilful, parents were liable to become negligent and unskilful, he went about the country, like a missionary, holding public meetings and giving sensible lectures on the subject of "home education." He aimed to incite parents to greater diligence and skill in watching over their children, and to make them feel that, however good the school might be, the home was, after all, the most efficacious and important influence in the development of the youthful mind.

In England an admirable volume was published on this subject some years ago by Isaac Taylor, a profound and philosophical thinker; but it is not adapted exactly to the conditions of American life. Mr. Burton understood our own people, and labored skilfully for their improvement and elevation.

MARTINEAU'S ESSAYS.*

Professor Martineau's essays are remarkable not so much for presenting any new phases of philosophical or theological doctrine, or even of new arguments for the positions of his school, as for the tact and sound practical judgment with which he has measured modern movements of thought and the tendencies of modern discussions, and signalized the principles on which that phase of Protestant Christianity which he represents must make its stand.

To speak with authority—to testify at the same time against ecclesiastical assumption in matters of religious belief, and to meet, on the other hand, the doubts and objections of the current scientific philosophy, it is clear that the theological teacher must, to a great extent, be his own prophet. A reforming religion, which is still a religion, must appeal from one authority to another. As the older Protestantism appealed from the Church to the Fathers and the canonical Scriptures, so the modern extreme of Protestantism appeals from the literal Scriptures to the reason and conscience of instructed and disciplined Christian men and women, as depositories of sacred truth not less authoritative than the historical documents themselves.

But a reason and a conscience that can be thus authoritative, even to the criticism of the sacred Scriptures, must be more than merely receptive or instructed representatives of revealed truth. They must be capable of reproducing it; not, indeed, at once and in the perfection which the truth has attained in the growth of centuries, but still by the instincts which the truth has only quickened and by a power which the truth does not create. Hence an essential philosophical position of that liberal Christianity which would still speak with authority, is that the native and original powers of the mind hold potentially the key to all divine knowledge; that every doctrine which can rightly claim the believer's assent must find its voucher in the believer's own instincts; that faith is the most certain kind of knowledge to those who have found their religious instincts answered in their creed. The *credo ut intelligam* of all religious philosophies means in this philosophy the yielding of the proud and wilful thought to the willing heart—not the trying on of creeds. This philosophy represents the reason as a native power of absolute knowledge, which cannot, however, possess itself of its inheritance save by repeated struggles and by the aid of outward and historical appliances.

Such being the ultimate ground of the religious authority which extreme Protestantism can exercise, it behooves our author, as he clearly sees, to vindicate against all opponents the philosophical doctrine of rationalism. His essays are accordingly directed chiefly against the experiential philosophy, as set forth in its several aspects by Comte, Mill, Bain, and Spencer. In Hamilton's "Philosophy of the Conditioned," as applied by Mr. Mansel to religious ideas, he meets his opponents on the theological side, who have come, as it were, by a flank movement over from the phenomenal philosophy into the camp of the ecclesiastics. With this power on its own grounds he does not feel called upon to deal very vigorously; but he battles most manfully against the tenets of positivism, with no loss of faith or courage from being apparently on the losing side.

Saving the merit we have mentioned, the excellences of these essays are mainly personal. With a style of most persuasive eloquence and with the sincerity of a clear and open-eyed faith, Mr. Martineau overwhelms by irresistible assault all spiritual opposition, and fails to win the battle only because the doubt he lays siege to is not the doubt of dull or faltering spirits, nor one which can be dissipated, like a mist, with the warmth of zeal and trust. Dealing, as he really does, with philosophers not less clear and earnest in their opinions than himself, his rhetoric is often misplaced. In the midst of keen discussion his meaning vanishes into a cloud, which is none the less obscuring for its brilliant and alluring colors.

The leading essay on "Comte's Life and Philosophy" has until lately been one of the chief sources of the general English reader's ideas of the religious character of positivism. Exhibiting great fairness of spirit and as much fairness of understanding as could be expected from a deeply interested opposition, this review yet fails to discriminate the really earnest beliefs of this school from the dogmatic atheism of the theologian's traditional and imaginary opponent.

It appears to be beyond the author's power of conception and credulity to believe that real excellences of character can be hoped for, and earnestly sought for, without a belief in their actual and present realization in an object of religious veneration. He takes offence at the pretension that the positivist can believe in any object worth his life's devotion, or that he can aim at the happiness of unselfish pursuits unless he renounces his scepticism and adopts the positions or "constants" of a religious philosophy. On the positivist's "type of real perfection, below which we must still remain, though it invites our persevering efforts to continual approximation," he observes: "May we not ask, *Where*, then, do you find this 'type of real perfection above us?' Is it indeed *real* to you? Or is it ideal, and that in the poor sense of being merely imaginary?" To this the positivist might answer, "Why is it necessary that we should 'find' this perfection realized in order practically to believe in its possibility, and to strive for it? Are the *savant* in his search for a more and more perfect knowledge, and the artist in his efforts to reach a more perfect ideal of expression and beauty—are they necessarily platonists, believers in the supersensible reality of ideals? Religions alone, or rather religious philosophies, postulate as essential to progress an actual contemplation of its end; but to every one who believes in a *better* than has been attained, the evidence of its possibility lies within the limits of his common human experience. Every man's sagacity outstrips his understanding, his purposes, and his performance; but does it on that account deserve *apotheosis*—to be called the reason, and be made participant of the absolutely true and beautiful and good? Or is it on that account evident that the sagacity is not informed like the understanding by experience?"

To the poetical representation of the phenomenon of progress as a growth or an effort to grow in a formative plastic power within us, there can be no exception taken on grounds of poetical truth; but to stake the moral culture and aspirations of the human race on the dogmatic truth of platonism, as our author does, is to limit the highest human interests by the conditions of a personal peculiarity.

* "Essays, Philosophical and Theological. By James Martineau." Boston: Wm. V. Spencer. 1866.

Mr. Martineau is platonic in his temperament, like his master the poet-philosopher Coleridge, but his gifts have a more practical turn, and he exerts himself in defence of the *à priori* philosophy not merely from a poetical instinct, but as the sagacious leader in a school of theology. He grants his opponents large latitude at the outset. All the world of physical science, all phenomena and their laws, are allowed to the experience philosophy. Inductive methods must deal with all these; but then inductive methods cannot take a step without starting from the unprogressive "ideas of causality, of soul, of God, of substance." If, on account of the unprogressive character of these ideas, the name of knowledge be denied them, the author does not object, "provided it be understood that they are, if not knowledge, the conditions of knowledge; if not the object seen, the light by which we see them." From these "constants" of religious philosophy he allows no abatement. They are essential articles of faith, and faith is knowledge. At least faith has all the certainty of knowledge, and only differs from it in not being acquired. It is almost a moral offence with our author to regard the principles of causality and substance as empirical generalizations of our experience of the connections of phenomena, or as hypotheses to account for these connections; and it is a sad moral delinquency not to see that these principles are recognitions by the reason *à priori* of the *necessity* of such connections. Power as well as phenomena—power as opposed to phenomena—belongs to the province of intuitive knowledge. And there are two distinct sources of knowledge, and both are concerned with all that we know. Physical as well as moral science has its postulate of pure reason. In short, Mr. Martineau lays down the *à priori* theory in all its purity, and holds to it on practical as well as theoretical grounds as essential not only to a religious philosophy, but also to a religious life; essential, that is, to every nobility of character and to every form of devotion. By those who have not studied metaphysics, these articles of faith are, of course, implicitly assented to, though the disciple may not be aware of possessing two independent sources of knowledge, or be on his guard against the wiles of the experiential philosophy.

It is, of course, important for the author to make out that the apostles of this philosophy are not very admirable men. With Comte the case was not very difficult; but when he comes to the great English champion of this school he speaks with some obscurity and hesitation. He experiences in the tone of Mill's writings "a singular impression of melancholy and unrest." But "a certain air of suppression" is the "greatest fault" he finds in him, "and the shade which it passes across his face is sometimes so strong" to our author's vision "as almost to darken the philosopher into the mystagogue," as if he regarded the world as unprepared for his lessons. No greater misinterpretation of a most natural and courteous reserve could be imagined; but it is a very instructive illustration of a deficiency of sympathy or insight, which is not uncommon with thinkers of Mr. Martineau's type of mind. Capable of infinite degrees of the love or the sympathy which looks upwards or downwards in reverent devotion or in tender pity, this temper admits of little real sympathy with what is around it but is not of its own household. Liberal to an extreme towards the opinions of students in science and in Biblical criticism, our author withholds his toleration from whatever interests him "from the moral side," if it be beyond the pale of the *à priori* philosophy.

MAGAZINES FOR JULY.

The "Atlantic" this month is unusually rich in distinguished names—Bryant, Lowell, Longfellow, Agassiz, Goldwin Smith, Bayard Taylor, Mrs. Stowe, and Charles Reade are among the contributors, and the contribution of the last-named writer, at least, is in his best manner. The interest of his "Griffith Gaunt" reaches a great pitch in these four chapters. The critics who thought the novel intended to show the dangers which follow the intermarriage of Roman Catholics with Protestants are probably by this time a little doubtful of their position. The immorality which other critics charge against it, our more robust virtue, or less acute perception, will not let us discover, and we are enjoying the story very much indeed. It is observable that in this novel the author has not, as too often before, spent a good part of his strength on extraneous matters, but everything tends to the development of the characters and to bring on the catastrophe. The opening article, "The Case of George Dedlow," begins well and ends in a very trifling way. Broussais would have been delighted with a patient who finds that the amputation of both legs and both arms has really diminished his sense of his own individuality, that the loss of half his sensitive surfaces has deprived him of his soul—as if the divine discontent were a function of the skin—the itch for immortality cutaneous, like *septennis psoriasis*. Goldwin Smith's "Englishman in Normandy" makes one remember the Englishman who every morning thanked God that he was not a Frenchman. He bitterly hates the second empire, which was to be expected, for he is a lover of liberty and a Christian, and he seems to entertain a contempt for the whole people, which was not quite to be expected, and which seems rather to be fortified by his reasons than born of them. Bayard Taylor in a pleasant paper makes us acquainted with the late Friedrich Rückert, a Bavarian, who yet was fellow-countryman with Saadi, and gives some scraps of translation which make us wish for more. "The Physical History of the Valley of the Amazons," which contains the record of the one day that the professor could spend in the pure enjoyment of nature in "a forest of monocotyledonous trees, with a dicotyledenous undergrowth," will have great attractions for many persons—for lovers of nature as well as for naturalists. Somebody writes a piece entitled "Aunt Judy." "Back through the tender twilight of my one dim dream of a sinless childhood I catch that accusing glimpse of my mother—and myself. And as I stand here on this shapeless cairn of remorses which, after forty years, I have piled on my butchered and buried promises," etc. It goes on even more strenuously, and piles up the agony, as the actors say, as well as the "cairns of remorses." We sincerely hope, for his own sake, that the writer is not really, as he seems to assert, forty-odd years old. Mrs. Stowe believes that the race of man is as pious as it ever will be till its health is better, and its ill health she attributes mainly to the want of ventilation in houses, schools, churches, court-rooms, and buildings generally. She praises an article in the May number of "Harper's," which, however, should be read in connection with an article in No. 49 of The Nation. The rest of the prose articles are the "Passages from Hawthorne's Notebook," "The Great Doctor," "A Bundle of Bones," a clear, truthful account of "The Siege of Knoxville," written by Major Burrage, one of its gallant defenders, and a curious and instructive paper, which its readers will wish longer, on "The Medicine Men of our Indian Tribes." For poetry we have stanzas by Mrs. Whitney; Longfellow contributes a sonnet about "the poet saturnine," which is pretty; Bryant an eloquent ode, the music of which reminds of Milton, and Lowell has a jocose trifle on a socdologer—we should have thought it; a sogdologer, he calls it—of a seven-pound trout.

"Our Young Folks" for this month seems to show that there is a dearth of such people as can be depended on to keep a children's magazine full. If we were going to select the very last sort of mental pabulum which even an omnivorous boy could be got to swallow, or could pretend to digest, we should select art-criticism as that sort. Mr. Aldrich's article about the studios has a mouthful or two of it, and generally of that pleasant piece we should say that about one in five hundred of the juvenile subscribers will like it, and about one in five of older readers will dislike it. The same is true of "Midsummer." "Afloat in the Forest" shows how very badly Capt. Mayne Reid is willing to do for money. Carleton gives a vivid description of Dupont at Port Royal, and Mr. Higginson's and Mrs. Stowe's articles are also excellent and interesting.

Admirers of Eugénie de Guérin will find in the "Catholic World" for July a translation of ten recently published letters of hers, written during her visit to Paris in the winter of 1838–9. They fill a hiatus in her journal. Another selection of merit is an article from the "Dublin Review" upon Origen and the Christian Schools of Alexandria, and for the rest this magazine, as usual, makes the general reader regret the death of "Brownson's Review," whose place it occupies.

"Harper's" for July is good at the beginning, and the end and all the middle is rather feeble and dull. Porte Crayon describes General Patterson's Bull Run campaign, as we may call it, for, although Patterson was not at Manassas, his dilatoriness and its effects are an essential part of Bull Run, as the world knows it. The writer injures rather than benefits his work by remarks and reflections evidently the product of afterthought. But there is not very much of this, and the uncertainty and mortification of that time live over again in his pages—the rawness of the soldiery, the inefficiency of our generals, the rose-water warfare, the insolence of the secessionists, the newness and strangeness of everything, are all depicted by one who was living in the thick of events, and made both pen and pencil serve well the quick eye of a practised observer. From the "Editor in his Easy Chair" we get, as it was hoped we should, his graceful speech made at the Shakespeare dinner of the Century Club, in response to the toast of "Woman," and some preliminary discoursing in answer to the remarks which the speech called forth from Dr. Vinton and Mr. R. G. White. "A Look at Lisbon" is a little dry, but infinitely superior to the flippancy of "Sanctuary Privileges in Rome." "An Hour at Sea" is good, and the article on "Francis Ashbury," the founder of American Methodism, tells in rather a formal style, but with a just appreciation of his enormous labors, the story of that remarkable man.

The "United States Service Magazine" dies, a good deal regretted, we believe, by military men, with the present number. There is to be found in it

a readable article on "Our Navy Yards," which marshals us the way that we seem to be going. It proceeds on the supposition that our future wars will be naval; that our means of building and, what is of almost more consequence, repairing Government vessels are utterly inadequate, and urges the establishment of new yards at several points on our immense coast line. "Screw Propulsion in Naval Warfare" is a readable essay, giving the history of that subject, and the other most noticeable article is a very laudatory biography of Major-General Meade, whom "Grant called the right man in the right place." That was praise certainly; but just what the place was it is of some importance to determine before we say how high praise. Not so high, we think, as the writer supposes, when he imagines the "Rollin" of a few centuries hence oblivious of Sherman and his march, and remembering Meade and Gettysburg. Under the head of "Correspondence" we find some interesting facts, the compilation of which is credited to the Washington correspondent of the Chicago *Tribune*, in reference to the mortality in the Union army during the rebellion. About two men, it appears from these tables, died of disease for one who died on the field or from wounds received in battle. If officers and men had perished in exact proportion to the number of officers and men, there would have been one officer killed for every twenty-five soldiers. But, in fact, one officer was killed for every eighteen soldiers. As to deaths from disease, there should have been twenty-five among the enlisted men to one among the officers; but instead of twenty-five there were ninety. It seems clear, then, that our officers did not shrink from exposing themselves in battle, and likewise it is clear that they were less liable to disease—less liable, probably, by reason of their better and more varied food, better shelter, better opportunity for personal cleanliness, and superior elasticity of mind and moral powers of endurance. This last consideration may account for the very great mortality from disease among the colored troops. Two white soldiers died of disease to one who died in action or from wounds. But for each negro soldier who died in the latter way eight died of disease. To the total number of deaths in battle or from wounds the New England States contributed the highest proportion per thousand. Disregarding fractions, there were 45 such deaths for every thousand New-Englanders in service. Of a thousand Middle States men 32 so died, of a thousand Westerners 37, of a thousand from the Border States 25. But though among the groups of States, New England, with Vermont at the head, thus excels, there is one Western State, a child of New England's, which surpassed her in this dismal pursuit of glory: Kansas lost 61 men in each thousand that she sent to the war, and she sent more than half her able-bodied men.

"Hours at Home," Scribner & Company's magazine of useful and religious literature, contains the usual quantity of more or less useful and not particularly religious reading. Dr. Philip Schaff treats of "Ancient Hymnology," giving a brief digest of what is known upon that subject; Donald G. Mitchell writes "De Rebus Ruris," and if his practical suggestions to farmers are as useful as his remarks are pleasing and readable, his paper is very much the best in the book. His practicalness has this good effect, at any rate—it may be nothing in itself, but it keeps him from sentimentalizing—a thing which he does so easily, and can do so well after its kind, that we have had something too much of it in his half dozen volumes. There are two features of this magazine which are peculiar to it among American magazines, and which might be made quite attractive. We refer to the long book reviews, embodying extracts from the work under discussion, and its article entitled "Books of the Month"—in which a great deal of current literature gets one or two descriptive sentences.

Lectures on the Study of History. Delivered in Oxford, 1859–61. By Goldwin Smith, M.A. Also, a Lecture delivered before the N. Y. Historical Society, December, 1864, on the University of Oxford. (Harper & Brother, New York.)—A letter to the "Westminster Review," *via* the *Daily News*, on the Moral Freedom of Man, and a lecture on the Foundation of the American Colonies, complete the contents of this volume, indicated only in part by the title. The compilation is more homogeneous than it would at first sight appear. When we have got from a learned professor his idea of the way in which history ought to be studied, nothing could be more in order than that we should test that idea by some study of his own; and of all such studies what more crucial one could be selected for the American reader than this on the foundation of the colonies which have developed into our present Union? Few will be surprised that Prof. Smith passes through this ordeal of the publishers (contrived quite innocently for the American market) with scarcely the smell of criticism on his robes. His admiration of the Puritan character perhaps carries him too far when he says of the church in New England that it has "enduring glory, because intolerance and persecution *instantly* gave way to *perfect* liberty of conscience and free allegiance to the truth." The transition was not immediate, and it is doubtful if it can yet be called complete—at least unless somebody dare affirm that the separation of church and state in New England is complete; as to which Mr. Buck's "Massachusetts Ecclesiastical Law" may be consulted. Nor do we think the lecturer has done full justice to the Indians, whose extrusion and gradual extinction may indeed be philosophically accounted for without by any means glossing the several acts by which an inferior race disappears before a more civilized. This expression cannot be used of Prof. Smith; but he has, we fear, taken too lenient a view of our dealings with the aborigines, though, as the Government treaties have always been more equitable and humane in their phraseology (and perhaps intent) than in their execution by Government agents, the error is one into which a foreigner might naturally fall. Nor is there much force in the suggested apology that the Indians were unsusceptible of the religious enlightenment offered them by the Jesuits and other of the early colonists of America. No such difficulty was the cause of the breaking up of the enterprise at Missionary Ridge, Georgia—a crime for which Prof. Smith may trace an apparent retribution in the battle which slavery lost on the identical spot of its former triumph. But these comments do not affect the general accuracy with which the elements that made up the original colonies are appreciated, and they must not permit us to overlook the thorough sympathy of the lecturer with all that was lofty and far-sighted and philanthropic in the founders of the republic. Here, as when theorizing in the preceding pages, we recognize his profound belief in character as the key to the philosophy of history—character, which determines the moral quality of actions, and in the formation of which nations rise, flourish, and decay, with a sort of tidal progress toward a higher condition of mind and conscience; and his faith in the religion of the New Testament as the sufficient handmaid of the best political systems of which the race is capable. It is on these points especially that he dwells in discussing the proper methods of studying history, and he engages at once with Comte, Spencer, and Buckle in contesting their right to reckon history among the exact sciences of which we have or may hope to obtain all the data, and in which no disturbing forces enter to interrupt the immutable laws to which the world of matter is subjected. It is seldom that our publishers, in seeking to reproduce the works of English authors, select so suggestive, thoughtful, we might almost say masterly, writing as we have here. We commend the book heartily to that public which Prof. Smith ever delights to honor with his praise.

The Student's Practical Chemistry. By Henry Morton and Albert R. Leeds. (Philadelphia: J. B. Lippincott & Co. 1866.)—This is a book of 286 pages, whereof 130, or five-elevenths of the whole number, are devoted to physics, 103 to inorganic and 53 to organic chemistry. The illustrations, 163 in number, take up a great deal of room upon the small pages, which are still further broken up into numerous small paragraphs with headings in capitals. The quality of the matter is as bad as the quantity is small. We are at a loss to say which most abound, incorrect, inaccurate, or unintelligible statements. Many sentences are entirely innocent of grammar, and, in fact, the general style is that of the hasty notes of a lecturer who needs catch-words to help his memory. Two examples, showing the average perspicuity of the style, must suffice. Speaking of ozone, our authors say: "Its test is paper moistened with starch, containing a little K I (starch, 5 parts; iodide of potassium, 1 part; to be boiled), which it turns purplish blue, or the juice of the mushroom, boletus luridus, boletus cyanescenus, etc., or the alcoholic solution of the resin of guaiacum, to which it communicates a blue color." It will be an intelligent student who learns from that sentence how to test for ozone. Concerning the sources of ammonia we read as follows: "Lastly, when organic substances decompose—I. Spontaneously; II. By heat alone; III. By heating with caustic potassa—the nitrogen and hydrogen combine, in the nascent state, to form ammonia, and in this way is derived the fertilizing property of manure and the ammoniacal liquor of gas-works, which is the commercial source of ammonia." A chemist might, perhaps, be able to detect in this farrago some traces of chemical truth; but a student would hardly find this one of those "clear and simple explanations" which the preface promises.

There is hardly a proper name in the book which is not misspelt. Thus, in Tyndale, Fraunhoffer, Kirchoff, Nichol, Naudhausen, and Reinch we have our authors' peculiar spelling of the well-known names Tyndall, Fraunhofer, Kirchhoff, Nicol, Nordhausen, and Reinsch. Such spellings as *dyabysis*, *eramakausis*, *regellation*, and *congellation* will not make it easier for the student to appreciate the derivation and signification of these words. The proper names of the chemical elements and their compounds sometimes begin with capital letters, and as often are not so distinguished; both modes of printing constantly occur in the same sentence. The book cannot have passed through the hands of any intelligent proof-reader. It were useless to attempt any serious criticism of the general method and plan of the book, considered either as a brief statement of the elementary principles and facts of chemistry or as a manual for students. It has no method but that of an abridged dictionary, without the usual merits of dictionaries, accuracy and a convenient alphabetical arrangement.

The book is exceedingly discreditable both to its authors and its publisher, and, it may be added, to the teachers who use it, if there be any such. It is much to be regretted that the name of a society which has done so much good work as the Franklin Institute should be officially mentioned on the title-page of such a work. Were it not for the sanction which the name of this society and that of the publisher lend to the book, we should not have spent time and space in noticing it.

PARIS GOSSIP.

PARIS, June 8, 1866.

THAT prince of dentistry, Dr. Thos. W. Evans, who numbers among his friends and patrons nearly all the crowned heads of Europe, and whose diamonds and orders prevent so many of his less fortunate brethren from sleeping, encouraged by the success of his work on the medical department of the great war in the United States, has just published, in the form of a series of letters, a very admirable description of the nature and working of the government of his native land. In addition to the intrinsic value of the

work itself, these letters derive a melancholy interest from the fact that they were written for the amusement and instruction of a nephew and adopted son of great promise, brought up by Dr. Evans, and who, after having taken for several years an active share in the professional labors of the distinguished firm of the Rue de la Paix, became consumptive, and died, a few months since, at the early age of twenty-three. The work in question treats of the origin of the Constitution of the United States, of the legislative, judicial, and executive powers of the States and their relations to the Union, of the Constitution of the United States, and of the various modifications which have brought that instrument to its present form. Clear, perspicuous, and concise, giving a bird's-eye view of a subject which has lately attracted so much attention on the part of the Old World, these letters may be said to constitute a valuable and instructive "hand-book" to the political institutions of the great republic of the West.

The virtual refusal of Austria to take part in the deliberations of the Congress which was to act as a conductor to the accumulated electricity which threatens so much mischief to this hemisphere, has given a severe shock to the confidence of the optimists; but it is not regarded here as absolutely excluding all hope of a peaceful settlement of the affairs involved in the pending quarrel, as it is still thought to be possible that Austria may yet reconsider a decision involving issues of such magnitude. Napoleon, at all events, seems to be really desirous of peace; and it will hardly be possible for the would-be belligerents to come to blows if he be seriously determined that the "peace" of this hemisphere shall not be broken at present. A fews days since, while inspecting the progress of the works in the Champ de Mars, as he does two or three times a week, he went up to a group of workmen, and after expressing his satisfaction at the zeal of all concerned, he added, evidently with the intention of having the remark repeated: "Do not attach too much importance, messieurs, to the rumors of war that are so rife. I, for one, am sincerely desirous of peace, and shall do my utmost to ensure its maintenance; but pray remember that, come what may, the exhibition of next year will take place as appointed, and exert yourselves accordingly."

The doings of the Chinese ambassadors excite but little curiosity here. The Parisians went wild over the Siamese envoys, and took an interest nearly as absorbing in those of Japan. The Cochin-Chinese found them somewhat less eager, and they are now becoming rather *blasés* in regard to Orientals and their peculiarities. The dresses of these representatives of the Flowery Land are, however, so splendid, the tissues of which they are composed are so exceptionally rich and splendid, that they have obtained more attention than has been accorded to their wearers. But the honor of their fabrication, popularly attributed to the transcendent skill of the dyers and weavers of the Celestial Empire, redounds, it is asserted, to those of France. It appears that the cases containing the wardrobes of these distinguished visitors were unfortunately wetted during the voyage, so that, on reaching Paris, all their contents were found to be so much damaged as to be unwearable. Great was the despair of the long-tailed magnates, who saw no other alternative but to shut themselves up until new suits could be procured from China. Luckily, however, some one about their almond-eyed excellencies suggested that patterns should be sent to Lyons, for imitation, when, to the amazement and delight of the Celestials, who were dying of impatience to see the marvels of the capital, there arrived, by return of post, an agent of one of the principal houses of Lyons, which for some time past has been turning its attention to the imitation of Eastern fabrics, with an assortment of fabrics so gorgeous and splendid that the ambassadors declared they surpassed everything they had ever beheld. These magnificent silks being purchased with enthusiasm, were at once entrusted to one of the best tailors of the capital, and made up exactly on the model of the damaged garments, and so quickly that, in twenty-four hours after the arrival of these beautiful silks in this city, the envoys of the "Son of Heaven" were feasting their eyes on the wonders of the "metropolis of Europe." From that moment to this the saffron-hued dignitaries have been doing the lions with an assiduity that proves how deeply their curiosity has been stirred by their first introduction to barbarian life. They have been received at the Tuileries, dined by ministers, and escorted by the proper officials to all the public institutions and the principal scenes of amusement. It is reported that their enthusiasm on returning from the opera was so great that one of the official *chaperons* attached to their service was moved to enquire what were the items of the evening's entertainment which had most forcibly struck their fancy, when he learned, to his disgust, that it was neither the house, nor the lustres, nor the scenery, nor the music, nor the costumes, nor even the lavish display of shoulders and ankles in the ballet, that had most delighted them, but the preliminary tuning of the instruments by the orchestra before each lifting of the curtain!

The Chinese embassy has, moreover, a formidable rival in the good graces of the *beau monde* of the capital in a couple of youthful cannibals attached to the train of Sir George Scott, staying here on his way back from New Caledonia. Sir George is trying hard to civilize these specimens of primitive humanity, and has already brought them to the capacity of wearing livery and handing ices and syrups to their master's friends. They are not handsome, but they are very alert, intelligent, and smiling, and seem to put so much good-will into the performance of the not very onerous duties of their new position that they are immensely admired and petted by all who see them. These amiable youths have been brought up in the practice of anthropophagy. One of them has eaten his grandfather, and the other has devoured the professor who trained his boyish powers to the use of the war-club—circumstances which appear greatly to enhance the interest taken in them both by their master's friends and the public of the capital.

The two young sons of Abd-el-Kader, now on a visit to this *focus* of modern illumination, are also much petted in aristocratic saloons. M. de Lesseps takes the lead in entertaining and lionizing these sons of a son of the desert (for they themselves know but little of true Arab life), and took them, a night or two ago, to the opera, to see "Le Dieu et le Bayadère," when the spectacle of the *claque*, of the chorus and anti-chorus of stout hands all clapping at once with the force and *ensemble* of a well-regulated machine, filled their unsophisticated minds with such amazement and so completely absorbed their attention that they had neither eyes nor ears for anything else.

The vast printing establishment of M. Paul Dupont, which employs 1,200 work-people, has just been celebrating, at its branch in the Rue de Clichy, the annual festival which brings together, at the same ample banquet, all the *personnel* of this model firm, in which every one of either sex employed in its various departments is a partner, and receives, besides a fixed amount of salary, a certain proportionate share of the year's profits. A worthy fellow-laborer of M. Arlès Dufour, the great silk-weaver and leading free trade apostle of Lyons, of M. Godin-Lemaire, the eminent iron-master of Guise, and one or two other practical philanthropists of this country, who have thoroughly laid to heart the great principle of human fraternity so generally lost sight of, M. Paul Dupont has created in connection with his industrial establishment—in which he employs female labor wherever it can be conveniently utilized—model dwelling-houses, in which the work-people are well and healthfully lodged at the lowest paying price; shops in which all the necessaries of life are sold at cost price and of the best quality; schools, reading-room, a sick club, a fund from which pensions are paid to each laborer who becomes disabled from age or accident, a loan club, and various other combinations which are supported, according to certain fixed proportions, by all the members of the firm, from M. Paul Dupont down to the humblest worker in the establishment.

On the gala-day in question all the workshops were thrown open to the public during one hour, thus giving to all who cared to inspect them the opportunity of seeing the interesting work of printing in all its varieties. The banquet, substantial and abundant, was furnished, as always, by the head of the house, and after it had been done full justice to, M. Paul Dupont made a general statement of the results of the year's work, of the state of the various departments of the establishment—schools, clubs, etc.—and sketched the plans in contemplation for the coming industrial year. A workman, delegated to that end by his brethren, expressed the gratitude and satisfaction of all in terms of warm affection, enthusiastically applauded by the assembly; M. Paul Dupont then distributed inscription-books, medals, and other prizes to those who had obtained the best marks in the schools and singing-class, and the fête terminated amidst the mutual felicitations of all concerned.

How oddly illustrative of the old adage, "extremes meet," is the fact that in this country of splendor, luxury, and intelligence, wolves, which became extirpated from England under the Plantagenets, still exist in great numbers, and that a sturdy beggar is reported, from the Puy de Dôme, who has been making a good thing of his profession by lying in wait about the farm-houses of that region until he knows that all the men are absent, when he makes his appearance holding a wolf in leash, and demands all the money in the house of the terrified womankind, with the threat of letting loose the savage brute upon them in case of refusal! A few days since he presented himself thus at a farm-house in which there was no one on the premises besides the mistress, who, so far from yielding to the threat, seized a fowling-piece that hung over the kitchen fireplace, and not only held the two-legged brute at bay therewith, but compelled him to precede her, with the four-legged one, to the village, where she gave up her captives to the proper authorities, amidst the plaudits of the neighborhood!

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

HOW WILL THE WAR IN EUROPE END?

THE outbreak of hostilities in Europe has probably by this time taken place. It is generally believed that a contest has begun which will probably terminate in a radical change in the political arrangements of the European continent, and give the final blow to the theories on which the settlement of 1815 was based. The aim of Prussia is, doubtless, German unity, but there is no likelihood that she will achieve such complete success as to render it possible for her to fuse all the small states under her own sway. To do this she would have not only to beat them, which would be no very difficult matter, but to beat Austria not a little, but very badly. Austrian force lies not so much in strength as in endurance. She is not capable of great efforts, but she has an almost unequalled capacity for what, in the slang of the prize-ring, is called "taking punishment." She has in her service a magnificent body of officers, who are bound to the empire by traditions and associations of extraordinary force, who are perhaps now the best representatives extant of a class once very numerous, that of professional soldiers, devoted to the country, but very deeply devoted to a certain government or reigning house. To Austrian officers the army is what it is no longer to the officers of any other country in the same degree—their only home and their only fatherland, and they are bound together by an *esprit de corps*. They have under their orders a remarkable power—troops drawn from the finest military races of the world, out of which an iron discipline has made an army which has neither the French impetuosity, nor Italian fire, nor the Russian solidity, nor the English firmness and destructiveness, but which has perhaps no equal in cohesiveness and tenacity. It is perhaps the only army in Europe which could witness the flight of its chief and the apparent dissolution of his empire without breaking up. It can, consequently, bear immense reverses in the field without demoralization, and draws perhaps at this moment as much inspiration from the memory of its defeats as most other armies do from the memory of their victories. It has survived so much disaster that hardly any disaster would now seem to it irreparable. A succession of rapid and terrific blows, such as the elder Napoleon gave it, might perhaps put it *hors de combat*, or bring the war to what Prussia would consider a satisfactory conclusion; but there is no probability—hardly a possibility—that any such blows will be delivered. Napoleons do not appear even once in a century, and, unless we are greatly mistaken, the world need not look for any remarkable displays of promptness or agility from either Prince Charles or Marshal Benedek. They will fight desperately and shed a great deal of blood, devastate a great deal of country, and contribute an interesting but not very novel or instructive chapter to the history of the military arts.

Consequently, it is not by any means certain that Austria is at present to lose her hold on Germany, or that the minor states are to disappear down Bismark's ravenous maw. Should Prussia at the outset suffer any severe checks, such as the loss of a great battle or two, it would be safe to predict a speedy peace based on her humiliating retreat from the conflict, and the overthrow and retirement of Bismark. Her population and the raw material of her army are far superior to those of Austria. There is probably no army in the world, not even our own, which can show in its ranks so many educated and intelligent men; and no army which has a more intelligent or better educated people to draw upon for recruits. There is no limit to the devotion and sacrifices of which such a people would be capable, if a crisis were to come which really kindled their enthusiasm. Were Bismark a popular leader, he would have a nation at his back with which he might challenge the whole Continent to the field. But he is not a popular leader, and no war brought on and conducted by him is likely to command the popular support, much less excite the popular enthusiasm. He is either profoundly hated or profoundly distrusted by all that portion of the Prussian people in whom the national pride and national pluck most abound. Therefore the present contest meets with the most decided opposition. The Landwehr has been dragged rather than marched to the field; the opening of the struggle seems, as well as we can judge, to be awaited by the public either with horror or foreboding, and we hear nothing of any enthusiasm even on the part of the regular army. The drawing of blood, especially should the outbreak of hostilities be marked by any successes, however trifling, may bring about a great change. Should there be early successes so great as to hold out a near prospect of what is now only seen in troubled dreams—the destruction of the whole tribe of princelings and the consolidation of the German people into one great state—there is little question that the Prussians would fling themselves into the struggle with an ardor which nothing could withstand, before which Austria would surely go down, and we should witness the appearance on the political scene of a power whose magnitude and real strength would certainly alter the whole complexion of European politics, and give a new turn to European progress.

"German unity" has presented itself to our minds so long as a mere vision babbled of by orators, or mused over by professors, that few foreigners have ever taken the trouble to think what it would really mean. It would mean, however, the sudden creation of an empire containing a population of over sixty millions—that is, it would be numerically the equal of Russia. But these sixty millions would be, unlike the population of Russia, of one race; they would include, perhaps, the most learned, patient, industrious, civilized people on the face of the globe, which has attained the highest distinction in arts, in science, in arms, in literature, in everything, in short, but in politics, occupying the most fertile of the favored portion of the European continent, and which would be capable of maintaining with ease a million of men in arms within a week's easy march of Paris. It will be easily seen by anybody who seriously considers the meaning of these facts that the creation of a real German state, whether empire or republic, would revolutionize European politics. It would launch an immense population on a career of extraordinary progress; it would consign France and England to the rank of second-rate powers. It would reduce Russia to comparative insignificance, and deprive her of most of her influence in European affairs, and even in Turkish affairs, and force her to find vent for her energy more and more in expansion eastward. Whether in such an event the House of Hapsburg could settle down on the Principalities of Servia and Bulgaria, and protract an enfeebled and somewhat inglorious existence, far removed from the scenes of its past greatness, may be doubted. But it is every day clearer and clearer that a royal house which has no nation at its back must soon cease to be a reigning house, and that the spectacle of kings existing for their own sakes is one which Europe will not much longer tolerate.

In case the Prussians succeed, it is of course possible that Louis Napoleon might seek, in the resettlement of the map, for what is called the "rectification" of the French frontier, by the abstraction of the Rhine provinces from Prussia. But this is something to which Prussia, victorious, would, in our opinion, never submit, and which she would be sure to resist successfully, and which, even if imposed upon her after a defeat, could not prove a permanent arrangement. Sixty millions of Germans united would treat a demand for the annexation of a portion of the true German soil to the French empire as absurd; and even if Germany should not be united, and this demand were successfully enforced, the union of Germany is not likely to be sufficiently remote to allow time for absorption.

Then there are changes going on in France which it takes close observers to perceive, but which are, nevertheless, exercising a marked influence on her foreign policy, and which promise, if not checked, to make her, perhaps in our lifetime, as pacific in spirit as England herself. The love of material comfort is increasing amongst the people with extraordinary rapidity, and as it grows the military spirit declines. The long freedom from political convulsions and the free-trade policy of the empire have, by giving a great stimulus both to foreign and domestic trade, enlisted a vast body of the population on the side of peace. The horror of war, which was once the reproach

of the Paris bourgeoisie, is working lower down amongst the population every day, and the population is not only not increasing but slightly diminishing, a fresh and striking illustration of the thrift and love of comfort of the whole body of the people; for in this case population, far from pressing too closely on the means of subsistence, is kept down by choice. We may, therefore, fairly count on a longer period of repose, of careful abstinence from interference in foreign quarrels, and a more single-minded devotion to the production of wealth than has ever been before witnessed in French history.

SPECULATION.

If we may judge from the language of a certain influential portion of the press, and from the theories of political economy which, so far as domestic trade is concerned, seem to find general acceptance among the people, we should conclude that the great lack of America was apron-strings. Society is no longer able to exist without the paternal guidance of the legislature in every department of life. Laws are called for to regulate all the actions of men. Eight-hour laws, we are assured, will reduce the labor and at the same time increase the pay of all mechanics. Landlords have been asking extravagant rates for houses, and this outrage, thousands of tenants honestly believe, ought to be checked by law; though whether by fixing a maximum for rent, or by compelling every man who owns two houses to build a third, is yet undecided. Unskilful workmen are found in various branches of trade, and it has, therefore, been gravely urged that we should return to the ancient system under which no one could work at a mechanical business unless he had served an apprenticeship of seven years. In short, there is a very general belief that in one direction or another men are unable to take care of themselves, and a general unbelief in the restraining and curative powers of natural law.

The most widespread form of this delusion is probably the theory which ascribes all manner of evil results to speculation. There never is a commercial disaster, a panic, or a scarcity of any necessary article, without an accompanying outcry against speculators. If goods are dear, the speculators for a rise are denounced without stint; if they are too cheap, the speculators for a fall have ruined trade. If a rotten corporation is brought down to dust, the bears are vigorously abused upon every successive decline in the shares; but when the receiver takes possession and the truth is made plain for the first time, the bulls are held responsible for having forced the stock upon an unsuspecting public. Thus, in the spring and summer of 1857 the newspapers filled columns with denunciation of the party which worked so vigorously for a fall during all that year, attributing every fresh disaster to the direct manipulations of the bears. The real crash began, however, with the failure of the Ohio Life Insurance and Trust Company, which had never been attacked by the bears, and which proved to have been long insolvent. This called attention to the condition of other institutions, numbers of which proved to have been managed with the utmost recklessness and even positive dishonesty. Naturally enough, these disclosures excited a general distrust of all similar corporations, and even sound institutions were compelled to strengthen themselves at the expense of their customers. The pressure for money soon revealed the fact that mercantile profits, and even capital, largely consisted in a process equivalent to a mere "marking up" of goods, and prices, which had for three years been unnaturally high, fell to rates unnaturally low. When the storm had done its worst, and the wrecks of commerce lay scattered on every side, the sagacity of the bears was too well vindicated to be longer disputed, and the same critics who had denounced the speculators for a fall now attributed all the disasters of America and Great Britain to the speculators for a rise during the preceding years.

During the last four years there have been enormous speculations in gold, stocks, and produce, mainly for an advance. Gold has reached 290 per cent., Erie Railway stock has been at 125 or more, flour is now $18 a barrel, pork $35 a barrel, and butter has been called cheap at 75 cents a pound. Loud have been the outcries of the afflicted and unwilling purchasers, and all kinds of remedies have been tried. The anti-butter combination, which all patriotic housekeepers remember, reduced butter from the atrocious price of 50 cents to 35, with the immediate result of sending an immense amount of it abroad, to be used as grease, the rates of exchange making it cheap enough for that purpose to English buyers. The next and logical result was a final advance to a much higher price than that which excited our indignation so deeply, and, the stock having been greatly reduced by export, the advance was permanent. The inflation of gold was first met by high-toned censures on moral and patriotic grounds. These failing, the Stock Board itself, the very seat and centre of speculation, was infected with the popular prejudice against its own business, and enthusiastically voted to exclude gold from its dealings. This deadly blow at the business was soon found to result simply in leaving the public at the mercy of cheats, who could return sales at almost any price they liked, there being no general and public quotation. Accordingly this restriction was abandoned, and the business was resumed upon a larger scale than ever. But in 1864 Congress resolved to try the remedial effects of legislation, and passed the celebrated Gold Bill, which did more mischief within the brief fortnight of its operation than all the speculators had ever been able to accomplish. It raised the price of gold from 180 to 290 within fifteen days. It struck a blow at the very foundation of public credit, for it was difficult for reasonable men to resist the conviction that the act indicated a state of mind among our rulers not far removed from lunacy. The promptness of its repeal, however, showed that the only fault of Congress was its total ignorance of political economy. Gold fell from 290 to 240 on the day that it was known that the statute would be repealed, and speculation left free to run its course.

Should not this signal example convince every impartial observer that restraints upon the operation of natural laws are unwise? There has seldom been a statute so rigidly obeyed as was the gold law during its brief and inglorious existence. The gold room was promptly closed, and not a single case of dealing, except for cash actually paid on the spot, was ever heard of. All that is usually called speculation was at an end. No other business was conducted under such burdensome restraints, none so effectively guarded against speculation; and in none was the rise so tremendous, or the panic so terrific. Brokers who previously bought and sold for a profit of one-fourth of one per cent., sold nothing at an advance of less than five per cent. Men took gold into the offices, sold it, came into the street, noticed the pale and anxious faces of the crowd pressing in to buy, and themselves repurchased, at an advance of ten, twenty, or thirty per cent., the gold they had sold ten minutes before. Three hundred per cent. was in full view; five hundred was freely predicted, and the depreciation of the public credit seemed likely to be unlimited. None were more terrified than those who had put their faith in legal prohibitions. The calmest men were those who had foreseen the results of such folly.

In reality, whatever may have been the motives of the parties concerned, the speculation in gold had certain beneficial results, which outweighed its evils. It tended to keep gold in the country, by giving its holders the continual prospect of an advance, without which it would all have left the country in 1862, and have remained abroad until the close of the war, since it would have been quite useless here and a mere deadweight upon its holders. Abroad, it would have drawn interest; here, it would not. The chances of speculation, however, seemed to promise something better than interest at foreign rates, and an immense amount of gold was kept here, to the obvious strengthening of the national credit; both the Government and the banks having always a handsome specie reserve. The very *excess* of speculation tended to produce this result, as it made shipments decidedly unprofitable, and foreign exchange unsalable. Thus we closed the war with a very respectable stock of gold, which then became available to the public at prices which were only too moderate.

¶ Speculation in food is often censured with special severity. Yet there is nothing in which it is more plainly beneficial. Were it not for speculators, the farmers would be utterly unable to sell plentiful crops while the price paid by consumers would be so low as to lead to extreme wastefulness. When in the course of nature a barren season came round, there would be no stores laid up against it, and all the desolations of famine would follow. Joseph and Pharaoh were, perhaps, the greatest speculators on record; and what is clearer than that their speculation in corn was the salvation of Egypt?

Speculation has a direct tendency to equalize prices over all the world. If cotton or iron falls much below its real value in one port, speculators promptly buy it for shipment elsewhere, thus raising the price where it is low and depressing it where it is high. Or they simply store it away, and bring it out when the price has advanced. In either case their operations tend to keep the price from touching extreme points, and thus benefit both the producer and the consumer. Of course speculation increases the *number* of fluctuations, but it greatly diminishes their *extent*, and keeps up a fair average rate. In the nature of things it cannot be otherwise, since no speculator intentionally buys when prices are too high, or buys with any other view than to sell again.

Excessive speculation undoubtedly leads to great evils; but so does excess of any kind. The events of the last four years have tempted many out of the pursuits of industry for which they were qualified into wild speculations undistinguishable from gambling. The country suffers greatly from such a perversion of mind and labor, but no more than it would if a few thousand persons, fitted by nature to be farmers, should become clergymen. The existence of fifty thousand useless priests in Italy does not prove that the three or four hundred missionaries employed among the freedmen or the heathen are not wanted in their present sphere. An excess of speculation works its own cure by drawing so many into the business that it gradually becomes unprofitable, and a reactionary tendency follows in favor of other occupations.

Fluctuations in prices may be injurious, but it is certain that they are part of the system which pervades the universe. Action and reaction are common to all branches of life. Where changes are frequent, they are not violent; but if, by a violation of natural law, fluctuations are repressed, the inevitable change, when it does come, is far more sweeping than it need have been, and that which nature designed for a relief becomes a disaster.

THE PUBLIC LIBRARY THE COMPLEMENT OF THE PUBLIC SCHOOL.

It is not often that we have a chance to indulge in the luxury of giving praise to our city government, or to any member thereof. It is, therefore, with the zest of protracted abstinence that we yield to the rapture of bestowing our heartiest commendation once again on Councilman White for his proposition looking towards the establishment of a public library in this city. This phœnix ot magistrates, this phenomenon of civic officials, turning aside from the jobs which constitute the business and the turtle-feasts which form the recreation of our City Fathers, has stooped to the consideration of so humble a subject as the intellectual and moral necessities of the common people. As one of that numerous though despised multitude we return him our humble thanks for his good intentions and bid him a hearty God-speed in his virtuous undertaking. It is almost too much to hope that a majority of those owners in fee of the city whose manor-house is the City Hall will consent to divert so considerable a proportion of the revenues thereof as this scheme would require from their natural channels, which sometimes in the line of directness, and sometimes by the more tortuous circumundulations of the line of beauty, find their way to their own pockets or those of their friends. But perhaps the days of miracles are not over, and Councilman White may be but the Avatar of a new dispensation, the first fruits of a municipal Pentecost of power even to change the aldermanic heart. Let us humbly hope and trust that this may be so.

The public library is the natural complement of the common schools. The importance of maintaining these is universally acknowledged in the free States, and we believe there is no ground of complaint against those of this city—at least none to which those of the most carefully provided cities are not also open. That intelligence lies at the foundation of free institutions is universally recognized, and the free schools are the testimony the people bear to their faith in the doctrine. The best minds of the community are busy in devising how these nurseries of the future can be made to answer their purpose the most effectually; and constant advancement is making in the application of the science of mind to the art of its best development. And this should be so, for in the schools is contained the commonwealth in the very act of growth, and the inclining of the tree depends, so Pope says, on the bending the twig receives in that tender stage of existence. But when the common schools have been brought to the highest degree of perfection possible to human institutions, we hold that society has not even then done its whole duty to the rising and the risen generation. The State should not forego its charge of its youth when the doors of the school-house close behind the grown-up young man and woman. The school, at best, can only teach the use of tools, and indicate whereabouts the material lies which is to be worked up for the nourishment, the development, and the adornment of the mind. Many young persons, of either sex, soon lose all taste for the studies which have occupied their pupilage, if they do not entirely forget them. The battle of life is too fierce a conflict to most of them to make it possible for them to go far out of their way, or to expend much of the sinews of their warfare on the continuing of their education. If they can make the trial, they find it hard to get the books and apparatus necessary for further self-cultivation.

For Gibbon never said a truer thing than that every man who makes any mark in the world has had two educations—one from his teacher and the other, and the more important, from himself. Now, surely, the system of public education, on which we so justly pride ourselves, is not complete until the public provide the free means of carrying on this self-education after that of the school is finished. Facilities and means for doing this should be brought within the reach of all, even of the poorest, and of these the most of all. The fountains of knowledge should be opened freely to all, that all may come and draw the waters of moral and intellectual life freely without money and without price. All comers cannot become learned men and women, but they may all become well-informed and refined ones, and the public should give them all the opportunity. The prosperity and happiness of every community depend on the virtue, intelligence, and good manners of the individuals that make it up. Whatever promotes these three conditions adds to the material wealth as well as to the harmless pleasures of the body politic; and nothing can promote them more effectually than the providing of useful and entertaining occupation for the leisure of the busy classes. Merely teaching the young citizens to read, though a great boon, undoubtedly, is a very imperfect one unless they can have access to books worth reading. It is inviting them to a Barmecide's feast, where there is nothing to eat. Or it is like the privilege the ladies are allowed at English public dinners—that of sitting hungrily in the gallery and seeing the lords of creation eating of the fat and drinking of the sweets below.

And the expense need not be so great as to deter the humblest community from thus completing its apparatus for the teaching of its children. A library containing all the standard English authors, with duplicates and triplicates of those most in demand, could be had for an investment of not more than two or three thousand dollars, and a very moderate annual appropriation would suffice to furnish it with all the new books worth adding to it. Of course, large towns and great cities would not be content with this modicum of mental food, but would provide for the necessities of the student as well as for those of the common reader. We are confident that no better investment could be made for the best interests of society, material as well as moral and intellectual, than such an appropriation of public money. The returns would soon begin to be perceived in the improvement of the general intelligence and morality. No better or more effectual antidote could be provided for the bane of bar-rooms, billiard saloons, and gambling-houses than the cultivation of a literary taste and the love for books which a free access to an ample library would furnish. To the allurements of pleasure and the attractions of vice the best counter-charm is that supplied by the magic of reading. The devil, we all know, is always readiest with his temptations in our idle hours, and the most potent exorcism against him to drown his whispers is to be found in the tones of the enchanters who transport us away from the ignorant present to the past world or to the fair fields of the imagination. Bell, book, and candle used to be the appointed means for putting him to an ignominous flight, and the two last will be found sufficient for the purpose, even now, if they be used aright.

If a public library have any power thus to prevail against the kingdom of Satan, we think there could scarcely be found a place where its virtue could be more satisfactorily tried than in this city—certainly the capital of one of the most flourishing provinces of that dominion, if not the great metropolis itself, of "Hell's dread emperor." At any rate, New York ought not to lag behind lesser cities in such a competition as this. The Astor Library, admirable as it is for its narrower purpose, does not meet the demands of this necessity. To answer its proper purpose, a public library should be a circulating library, with proper limitations and restrictions. This is the case with the Public Library of Boston, and has been for about ten years. That library is divided into two portions: the one consisting of English literature in its entirety—poetry, history, travels, fiction, etc.; and the other of the higher branches of science, the classics, the literature of foreign nations, valuable illustrated works, and the like. All is open to everybody; but the first is strictly a circulating library, and it is kept in constant circulation. The last time we heard of it the average number of books taken out daily was over a thousand, and the average of loss or injury, other than by necessary wear and tear, infinitesimally small. The trifling fines imposed for over-detention of books and other slight violations of the rules more than made all these losses good. The first care of founders and custodians of libraries generally is to preserve the books as long and to keep them as nice as possible. Here the object is to have them worn out by fair and honest usage as soon as may be, when they are replaced by new copies. This, of course, is not the plan as to the other and higher division of the library. Any one may consult the works it contains, and these can be taken out by special permission and on proper conditions. The whole library is for all. The division is for the convenience of the general reader and the accommodation of the special student. Now, New York should have such an institution, were it only not to be eclipsed by her lesser sisters. As we suggested the other day, the mere providing of a proper building and the inauguration of the institution would attract benefactors and benefactions to it. The establishment of the Boston Public Library induced the late Mr. Joshua Bates to make it the object of his princely liberality, who thus built up for himself a monument which can never wear away, but will endure as long as the intellectual pleasure and improvement he has promoted by his bounty shall continue to increase. Let Councilman White only be allowed to begin this good work, and we have faith that a Bates will be raised up to help complete it.

LINES TO A PAINTER.

Your "View from Nature," friend,
I 'm not disposed to flatter,
For if Nature looks like that,
I 'd rather not look at her.

I wonder where you got
The tints you make those dyes with—
And where you bought the specs
You use to see your skies with;

And where the blue is found
You do whate'er you please with;
And the purple for your ground,
And the green you paint your trees with.

Spinach and eggs we like
Upon a plate at dinner—
Not on a canvas smeared,
Though done by a "beginner."

I do n't think Nature has
Such sad blue devils ever—
Or on the Catskills gets
Such fits of yellow fever.

So pray excuse me, friend,
If your critic cannot flatter,
For if Nature feels *so* bad,
I 'd rather not look at her.

NITROUS OXIDE AS AN ANÆSTHETIC.

To the scientific observer there are few things in the annals of human progress more remarkable than the history of inventions. Whether the invention be great or small, in the ordinary acceptation of the term, is but little matter; as a general rule, there will still be found in its history the same series of partial successes to sustain the enthusiasm of its advocates; the same cheerless story of failure to attract the attention or to enlist the sympathy of that portion of the public which ought to be most interested in its success; and finally the same tumultuous applause and gratulation from all quarters when the world has once fairly turned its favorable eye upon the nursling. The invention having been "introduced," universal homage is, for a moment, rendered to the fortunate individual who, by chancing to display the infant at an opportune moment, or by luck of holding it in a new ray of light, has enabled the spectators to perceive the transcendent charms which had hitherto escaped attention, or been seen only by worshippers at the inner shrine. Sometimes, often, it may be, the appearance of the infant has really been improved under the care of this last of its nurses. It is better clothed than formerly, plumper, cleaner, and more comely; or it has been trimmed by corset and scissors into a nearer conformity with the conventional order of things. But this homage is of short duration. In so far as it is undue, in so far as it detracts in any way from the merit of others who have labored in the same field, and have really aided in the attainment of the successful result, the factitious glory quickly fades. The cry of fair play will be raised of a certainty. The voice of criticism makes itself heard. The case is sure to be passed upon and adjudicated in the tribunals of the world of science and art. The evidence finally comes to be written out in black and in white, ready to be summed up by any enquirer who may be desirous of satisfying his own sense of justice. And after no great number of years have passed, something like a just appreciation of the real merits of the case will prevail.

That the foregoing views will apply to the history of the discovery of anæsthesia, as to that of all inventions which are of sufficient importance to attract much attention, there can be no question; though for a clear understanding of this particular subject we are not yet sufficiently far removed from the time when the value of ether as an anæsthetic was first generally recognized. Yet another generation, perhaps, must grow up before partisan feelings shall have died out, and have given place to that purely judicial spirit in which alone such questions can be brought to a settlement.

The discovery of the power of ether-vapor to produce insensibility to pain is, of course, the turning point in the history of the invention of anæsthesia, for then it was that the world realized the value of it. To this event and to the actors in it no small share of applause may justly be accorded—in spite of any lack of nobility of feeling which may have then been manifested, and of all faults, follies, and drawbacks, of whatever name, which contemporaneous reports have associated with the discovery. But as time rolls on, the conviction is forced upon us that the prime fact of anæsthesia has been visible for years, and that this fact had really been seen by many individuals, though perhaps few among the gazers had ever fairly and fully realized and, as it were, assimilated the phenomenon. The power of nitrous oxide to produce insensibility to pain was recognized by Sir Humphrey Davy at the beginning of the present century, at the time when he was experimenting upon the gas with special reference to its exhilarating and intoxicating effects upon the animal economy. In a memoir entitled "Researches concerning Nitrous Oxide," published in 1800, Davy remarks: "As nitrous oxide in its extensive operation seems capable of destroying physical pain, it will probably be used with advantage during surgical operations, in which no great effusion of blood takes place." The efforts of the late Dr. Wells, of Hartford, to introduce nitrous oxide as an anæsthetic agent in surgical practice, are familiar to the American public. There are, in fact, many persons who now believe that the application of ether-vapor as an anæsthetic is a result which has grown out of, and is in a great degree directly referrible to, the discussions which were incited by Dr. Wells. However this may be, the importance of nitrous oxide as an anæsthetic agent, and the significance of Dr. Wells's aspirations, have been brought into bold relief by the experience of the last few years. As everybody knows, nitrous oxide is now very extensively employed by the dental surgeons. By many members of the profession it has come to be regarded as a safer and a more convenient and agreeable agent than either chloroform or ether for a large class of operations.

A manufacturing chemist of Boston, Mr. Sprague, who appears to have devoted himself particularly to the manufacture of nitrous oxide and the materials which are essential to the preparation of this gas in a state of purity, has lately made some statements with regard to the matter which may serve to explain the discrepancies and failures which embarrassed Dr.

Wells. From these new data, moreover, it is easy to frame a hypothetical explanation of the curious fact that the anæsthetic value of nitrous oxide did not become generally known years ago. It can now be at least inferred how it happened that neither Davy nor Wells was able to bring the gas into practical use.

According to Mr. Sprague, the gas which is obtained by decomposing pure nitrate of ammonia at a low heat is quite different in anæsthetic effect from that prepared at higher temperatures. He insists that in preparing nitrous oxide for inhalation the heat should be controlled by an automatic regulator, in such manner that the temperature of the nitrate of ammonia within the flask shall be maintained at a nearly uniform degree, lying somewhere between 400° and 410° Fah. Gas which has been thus prepared and carefully washed may be inhaled with perfect safety; and, as a safe and reliable anæsthetic, will, in the opinion of Mr. Sprague, compare favorably with any other which has yet been devised. On the other hand, gas which is prepared at higher temperatures, as is usual in the ordinary method of heating, where the heat, all the while fluctuating, often rises to 500° or even to 600°, exhibits very different physiological effects even after it has been thoroughly washed. The gas obtained at these high and irregular temperatures produces disturbed anæsthesia, and appears to act more directly upon the brain than that which has been generated at low temperatures. It has more taste withal, and persons of sensitive lungs are liable to experience inconvenience and distress upon breathing it.

Mr. Sprague's statements are timely. Every chemist who has frequently had occasion to prepare nitrous oxide must have noticed the wide difference in appearance which the gas obtained at one operation will exhibit as contrasted with that of another. At one time the product will be transparent, odorless, and colorless; at another it is pervaded with a dense white fume, which subsides only after the lapse of considerable time. This fume may possibly be due to the presence of nitrate of ammonia, as would, no doubt, be suggested by some chemists; or it may be the antozone cloud of aqueous vapor which has recently been so carefully studied, in another connection, by Meissner. In either event there can be no doubt as to its being an irritating agent, or as to the likelihood of its being competent to produce the disturbing influence which is attributed by Mr. Sprague to those samples of gas which may contain it. It is admitted by Mr. Sprague that the gas made at high temperatures is peculiarly uncertain, as an anæsthetic, when taken into the lungs soon after it has been prepared. This observation would go to corroborate the idea here suggested, that the disturbing element is extrinsic, and not in any way dependent upon an allotropic change in the nitrous oxide itself, as has been advanced. For it is known that the antozone, or the nitrate of ammonia, whichever it may be, will disappear from the gas which contains it when this is allowed to stand over water for a sufficient length of time. The admitted necessity of thorough washing, in any event, no matter at what temperature the nitrous oxide gas has been prepared, is another item of testimony which points in the same direction. It would be well, by the way, for all persons interested in the cleaning of gas, to take note of the fact, which chemists are nowadays beginning to recognize, that as a general rule a gas can be far more effectually cleaned by causing it to pass through several columns of some porous material, such as pumice, cotton, glass-powder, lime, and the like, than by any mere bubbling through water. In many cases it is not even necessary that all the porous material shall be moistened, if only it be chemically capable of absorbing the impurities; the action appears to be mainly dependent upon mechanical subdivision, the gas, as it passes through the porous material, being broken up into minute particles, each one of which is brought into contact with the purifying agent.

Against the absurdity of inhaling nitrous oxide from plain bags, or bladders, as in the old way, Mr. Sprague very justly protests. Where the breath expired by the patient is re-inhaled into the lungs over and over again, as must necessarily be the case in the simple bladder arrangement, the nitrous oxide will, of course, even become very impure—the more so in proportion as the inhalation is longer continued. The insensibility produced by this method of treatment may, therefore, be in part fairly attributable to the asphyxiating power of carbonic acid. In any event, the effects obtained cannot be wholly due to the nitrous oxide. The inhaling apparatus now employed is evidently a great improvement upon the old plan. It is simply an apparatus furnished with valves in such sort that the pure gas can be drawn into the lungs, while that which is expired is thrown into the open air.

As to whether or no nitrous oxide can ever be employed with advantage in protracted operations, the question seems to be still open. Mr. Sprague narrates that in several instances he has known complete anæsthesia to be maintained by means of this gas during surgical operations lasting from four to seven minutes and with the most happy results as regards recovery from its influence upon awakening. Others have mentioned successful cases where anæsthesia was maintained during much longer periods. Mr. Sprague is himself of opinion that entire insensibility to pain may be maintained for a longer period than would be safe with ether or chloroform. This, as he asserts, "may be inferred from the vitalizing character of nitrous oxide, which maintains the temperature and pulse by oxidizing the blood, while it is well known that the effects of ether, or more particularly chloroform, are the reverse of this" (Boston Med. and Surg. Jour., May 17).

Some idea of the extent to which nitrous oxide is used may be got from the statement that in a single dental establishment in Boston it has been employed for producing anæsthesia in nearly eight thousand cases.

MR. LINDSLEY'S WAY OF PROMOTING PRAYERFULNESS.

From the foundation of the world till now the theory of virtue, like the practice of it, has been too much for human powers. It is not many months since we heard of an undergraduate philosopher in Harvard, who, being asked in a yearly examination, What is virtue? replied in writing that virtue is the chief of the virtues. He is an ethical philosopher who has far to go before he reaches even that opinion of Protagoras, that virtue is an art which may be learned, and which, therefore, *à fortiori* (here proverbial philosophy would speak of the giving and taking of good advice), may be taught. It is an opinion not to be taken without modification, as we may discover by a look at Professor Fowler's *Phrenological Journal* and the pictures in his show-cases. It prevails, however, and practically is received in all its naked simplicity, and incidents constantly occurring attest the prevalence of this theory, if they do nothing to prove its incorrectness. But now and then some incident occurs, as the other day in Medina, of such a nature as to show us that although in this, as in other matters, the ideal may be impossible of attainment, it is of some importance that the ideal set up be the right one. A clergyman in the village referred to has, or rather he had, an infant son of three years old, whom, of course, he has been in the habit of training up in the way it should go. Therefore, when the child's stepmother required it to say its prayers, and the child, without assigning any satisfactory reason, refused to do so, its preceptor in virtue took a shingle, or, as some say, and as would have been more Solomonian, he took a heavy rod and chastised it, to use a euphemism of his own, for rather more than two hours, at the expiration of which time, possibly with a prayer on its lips, but with no recorded indication of docility, it died in its instructor's hands.

This Medina minister, it seems clear, must have held a radically mistaken notion of what constitutes virtue. His theory of virtue has led him straight to the gallows. Yet even he, one would have thought, must have known that by nature, which can no more be driven out with a shingle or rod than with a pitchfork, by blood, because his child was a child of his, it could never with any amount of instruction from father and stepmother—never though it should live to be an ordained minister of the gospel of love, though it should dispense the sacramental bread and preach the word which purifies the heart, and which annulled ceremonial ordinances—it never could be anything but a soulless, iron-hearted monster, with not very much more capacity for virtue than is possessed by a plaster cast of a murderer. But supposing that the baby's own mother, had she been living, would have striven to prevent this chastisement; that she was such a person as to make her offspring heir to a nature human rather than devilish, so that her son might have been worth whipping hereafter if he had not been untimely whipped to death—still, admitting all this in the case of this victim, what a notion of virtue it is that in one of its extreme manifestations tortures the life out of a span-long babe because it is refractory about its prayers or catechism! What a delusive, and, as a principle of education, a fatal idea of an infant's capacity, to treat it as able to comprehend either the meaning of prayer or the theory of parental discipline, when to send it to school would be inhuman! and what a theory of domestic government when a child is tamed as we tame a brute—belabored until resistance becomes a physical if not a moral impossibility. Yet even this terrible murder is not an isolated instance. The milder manifestations of the same spirit, though, happily, it is a spirit opposed to the genius of the American people, have fallen under everybody's observation. We all know families where two people of the best intentions that narrow minds and cold hearts can cherish succeed in making of their children half a dozen hypocrites and one rebel. The Jesuit fathers, we are informed, find that when American men make what is called a *retreat*, and are required to write out meditations on certain prescribed subjects, it is almost impossible to get from any one of them a good meditation on hell. This may be so, but if it is we should say that the fathers would do well not to generalize upon the American religious character without an acquaintance with the class represented by Mr. Lindsley, of Medina.

Correspondence.

"PARDONS AND MORALITY."

To the Editor of The Nation:

Your discussion of "Pardons and Morality" in The Nation of June 5th opens a serious question. We have not opened our eyes to the change which the progress of society and the growth of free institutions have made in the position of the criminal. In earlier times it was from power and oppression that danger was to be feared; all the safeguards of society were devised to protect the accused against the arbitrary punishment of the magistrate. The trial by jury, the *habeas corpus*, the pardoning power, all grew out of the fact that society had more to fear from the governors than the governed; and they have all been mighty instruments of progress. But now, so far as ordinary criminal procedure is concerned, this is wholly reversed. It is from the criminal class that our peril comes; we err more on the side of lenity than of severity; there is very little danger that the innocent will suffer, but very great danger that the guilty will escape. Unless we realize what a total revolution has taken place in the relation between government and criminal we shall never cope successfully with this gigantic enemy—crime.

If, however, we fail to appreciate this change, there is another quite as vital to which our community is rapidly becoming awakened—the nature and object of punishment. Side by side with this movement which elevates punishment from a barbarous and vindictive vengeance to a wholesome restraint, whose aim is to humanize and reform, let us learn to accept and understand that fundamental principle of punishment, that it must be sure in order to be efficient. Let us feel that—granted the justice and adequateness of the punishment imposed—we have no right to exempt from it; it is no kindness to the criminal and is a great wrong to society. This, of course, does not interfere with the method of shortening the term of punishment by good behavior, as in the Irish system, for this is one of the conditions of the punishment imposed.

I have no doubt that the pardoning power, as it exists and is exercised, does vastly more harm than good, and that it would be better for the community that it should not exist at all than that it should be used as recklessly as at present. If the only alternatives were, to keep it as it is or to abolish it altogether, it would be better to abolish it. But are these the only alternatives? There is no doubt that it is often the cause of great good, and it would be a pity to cast away entirely a useful instrument because it is so often abused. Might it not be possible to guard against the abuse of the power by dividing it? It might, for instance, be granted to the legislature instead of the executive, but to be exercised only on the recommendation of the governor, and then by a vote of say two-thirds. The object would be to preserve the power for those rare, special cases in which there would be overwhelming arguments for its exercise, leaving the mass of criminals to work out their full terms, shortening them by good behavior, but with the conviction that in no other way can they possibly be shortened. A really weighty argument for capital punishment is that imprisonment for life means being pardoned out in ten years or so; but this argument would fall to the ground if the pardoning power were practically abolished.

Marcel.

THE BEET-SUGAR MANUFACTURE IN GERMANY.

To the Editor of The Nation:

Day before yesterday, in the forenoon, I left the great cathedral in Magdeburg and came out through the old wall and over the drawbridge, and started for this place on foot. I turned back many times to take what I supposed would be a last look at the grand old grey towers that lifted themselves so nobly up in the clear sunshine, but still they lingered in the horizon. It was well toward the middle of the afternoon before they disappeared, and then only through the intervention of a hill.

"Immer gerade aus," and a gesture straight toward the south, had been my directions while crossing the moat bridge, and so they continued all the afternoon, and "right straight ahead" I walked on the hard turnpike, bordered by unbroken rows of cherry trees, till it grew monotonous. Far out on either hand stretched the grain fields, only varied by a gentle rolling, without fence or stump or tree, except here and there a small piece of planted pines. The fields of oats and rye predominated over all, green and luxuriant, interspersed occasionally with patches of beautiful yellow, where grew the rape, and long strips of fresh ploughed land. The great, sleepy windmills flapped leisurely in the brisk, cool wind and a thousand sky-larks were hanging in the air, singing as they flew.

After an hour or two I began to come into the midst of the great sugar-beet plantations for which this part of Germany is celebrated. The fields in which the root is planted here are often of vast extent, sometimes two or three hundred acres, reminding me of the prairies of the great West or the plantations of the South. I was inclined to continue the comparison last made much farther after seeing the manner in which they are cultivated. The beets are drilled in rows about fifteen inches apart, and the whole labor of tilling them, from first to last, is performed with the hoe. Never before had I seen so complete a reproduction of some of the scenes I have witnessed in the Southern States on the great cotton plantations. Here were at work men and women together, from fifteen to eighty in one gang, hacking stolidly over the ground with the same mechanical stroke that marked the slaves. In one row I counted eighty-one, and they were principally women. At least two-thirds of the laborers that I saw that day—at least a thousand—were women, and they were working generally in company with the men. To complete this Southern picture, there stood before these largest gangs the overseer, moving continually back and forth in front of the laborers and carefully scrutinizing their work. Sometimes he carried a hoe, but generally only a stout stick, and the ruggedness of the German which he sometimes employed upon the dilatory, though it was not intelligible to me, showed that his authority was very well established. The overseer never ventures to strike a laborer; but I have seen him rudely thrust about and harshly berate the younger laborers in a style that comported very ill with my notions of German independence of character. The laborers are very meek under these administrations, as they are almost absolutely dependent on the miserable pittance of daily earning for their daily bread. As I passed these groups of laborers my foreign appearance attracted their attention, and they paused a moment to bestow on me that stupid, listless stare that has made me sigh for human nature in Mississippi and Texas. When their labor is ended, however, and at the nooning, they display the same buoyancy and often playfulness that are characteristic of the blacks. When the village bell in the distance or the winding horn calls them to their simple fare, they often caper and chase across the fields in a rough buffoonery that shows the German elasticity of temperament still unimpaired.

The clothing of these peasants is, of course, of the simplest and cheapest; a short, thick dress of woollen and a close hood of the same for the women, and cheap, substantial store-fabrics for the men. The women wear almost entirely material of their own manufacture, even to the shoes, which are mere soles of wood with a little leather tip or socket to retain them on the foot; but the men wear much less of it than our country people in America.

The wages that these people get are, for American needs, utterly insignificant, and they are certainly small enough even for the supplying of German wants. The men get from sixteen to nineteen cents a day, the women from thirteen to fifteen, and that for a day of fourteen hours; for they generally begin at five o'clock and work till seven. Their labor is not severe, but very tedious and exhausting.

At Stassfurt, a thriving city of 15,000 inhabitants, I found the manufactories of beet sugar more numerous, perhaps, and certainly greater than in any other city in Germany. One of them employs a thousand operatives, another six hundred, and several others four and five hundred each. The beets are brought from the fields and elevated to the upper story of the building, where they are cleaned, crushed, filtered, etc., the juice descending from story to story, through curious processes, until it reaches the last one in the shape of beautiful "sugar hats," or cones of about two and a half feet in length, of the best quality of white sugar. The juice of the beet is red, a shade lighter, perhaps, than claret wine, but when boiled down without purification the sugar is only slightly tinged. This is called the "red sugar," and is converted into white by the use of blood. It is cast in earthen molds, of the size of the "hat" above mentioned, in which it is dried eight days and then taken out and polished for market. Turn one of these clear, solid cones up on its edge and strike it with a key, it rings like the purest steel. The price of this sugar at the factory at present is ten cents a pound, and, after testing it a hundred times, I pronounce it not at all inferior to the best article from Louisiana. One establishment, employing six hundred laborers, turns out six million pounds a year. The beets cost ten cents per hundred pounds, taken from the fields.

Here the condition of the laborers is worse than in the country. Stassfurt is a considerable city, and has most of the evils of larger cities without the compensating good of the country. The streets are narrow and crooked, the houses low, uncomfortable, and dark, and the presence of such a number of great manufactories brings into it a great number of poor people, who are crowded into small tenement houses. Many live in what the people here call barracks—the same as our tenement houses, only lower, longer, and built of stone, plastered over with coarse mortar or mud. Generally each

family has one room, though in some cases two are crowded together in one apartment not over twenty-four feet square. German families are usually populous, and the number of white-haired young Teutons that swarm about some of these barracks among the dogs and geese is alarming. But they are most stinted in their bill of fare. The employee's contract generally embraces rent and provisions in addition to a certain amount of wages, and in these cases it practically results that the proprietor furnishes such a market for them as he sees fit. In one establishment, the employees of which live in barracks, they have pork twice a week —Sunday and Thursday—for dinner; never beef or mutton. In another they have the same three times, to wit, Tuesday, Thursday, and Friday. For the rest they must make it up from potatoes, cabbage, rye bread, lentils, and greens. The mixtures and combinations of these various articles, according to the German liking, in not less than a dozen different dishes, in each of which vinegar has a prominent place, it is needless to enumerate. Milk and butter are very seldom seen in Stassfurt on the tables of the workmen; in the country it is better. There you will see a company of tired laborers seated around a huge pan of boiled potatoes and a dish of sour milk, each one peeling a little heap of potatoes before he makes a beginning of his meal. A cellar of salt and a spoon for the milk complete the preparations, and before they make an end of the matter the amount that has been disposed of is enormous. The greens they eat in this season of the year would go far toward keeping a respectable cow. But they are healthy, despite all this; healthier than we Americans, and live longer. They are living illustrations of the practicability of a vegetable diet and of its beneficial effects, when taken with a judicious proportion of flesh.

I arrived in Eisleben yesterday, and have paid a visit to the houses in which Luther was born and died; also the church where he preached three days before he died. The registers here kept show that a large number of Germans visit these places daily, but I have not seen the names of more than three English or American visitors within two years.

MUSKINGUM.

RICH! RARE!! CHEAP!!!

THE

METHODIST PICTORIAL CENTENNIAL,

ALTOGETHER

SIXTEEN PAGES OF READING MATTER

AND

SIXTY-EIGHT PICTURES.

IT HAS THE READING MATTER OF A $1.50 BOOK.

Articles of great variety by Bishops Janes and Thomson, Drs. Curry, Stevens, and Peck, Prof. Newhall, Mrs. Olin, and many others. Then there are three articles which might be called pictures, and should be framed and hung up in every Methodist dwelling in the land. The first is one hundred historical anecdotes and incidents illustrating Methodism along the century. Second, the striking traits of one hundred, or a centenary of Methodist preachers, as representative men of the last hundred years. Third, fifty living Methodist preachers who have preached fifty years and over—describing their character, work, and standing. It is remarkable that there are just fifty living men who have preached fifty years and over.

PICTURES.

1. Centenary picture, with five historic scenes; 2. The portraits of our Bishops and other distinguished men; 3. John Street mission scenes—eleven distinct pictures; 4. Camp-meeting—the largest and most beautiful camp-meeting picture ever made, with Dr. Bangs preaching to a vast audience; 5. Twenty portraits of our representative men—college presidents, editors, agents, historians, literary men, etc., etc.; 6. A group of thirteen of our representative women. It is a remarkable fact in the history of portraits of ladies that this is the first group ever put into a picture by an artist; 7. Pictures of churches and seminaries.

Each picture, framed, will make a splendid historic ornament.

We hope our friends will send for this Pictorial. You cannot get so many Methodist attractions—curious and useful—and so much Methodist history so cheap.

Post Free, complete for 25 cents, to all Parts of the Country.

AGENTS WANTED in every town and society in the land. Ministers, ladies, and children can sell a large number of this work.

EDITED BY DR. CURRY.

N. TIBBALS, Publisher,

37 Park Row, Room 6.

A NEW VOLUME. THE PHRENOLOGICAL JOURNAL for July,

No. 1, Vol. 44—Contains Forty Portraits of distinguished Statesmen, Clergymen, Soldiers, and Criminals, as follows: Webster, Talleyrand, Clinton, Metternich, Jefferson, Cavour, Peel, O'Connell, Russell, Buckle, Antoine Probst, Thomas Raffles, General Scott, Albert Barnes, Isaac Ferris, Charles Hodge, Andrew L. Stone, Thomas E. Vermilye, Leonard Bacon, Horace Bushnell, R. J. Breckinridge, H. W. Beecher, T. L. Cuyler, R. S. Storrs, J. T. Duryea, etc. OUR SOCIAL RELATIONS.—The Servant Question; Manhood and Womanhood; How to Punish a Child. PHYSIOLOGY.—Feeding Children; To Young Mothers. SIGNS OF CHARACTER.—Physiognomy of Statesmen; National Characteristics; The Law of Quality; Intellect, North and South; The Great Mystery; Another Prophecy; Teach Children to Think; Milton's Last Poem; Soldiering and Crime. A rich number; 20 cents, or $2 a year. Address, FOWLER & WELLS, New York.

FINANCIAL REVIEW.

NATION OFFICE, Thursday, June 25, 1866.

SPECULATION continues active in gold, and while a large number of persons sell it short on the theory that it is too high, at least an equal number buy with confidence for the rise. The volume of gold on the Street is so disproportioned to the short interest, that it is worth from 1-16 to ⅛ of 1 per cent. for immediate delivery. Nearly ten millions will be disbursed by the Sub-Treasury on the 1st proximo in the payment of interest on the national debt. Exchange continues heavy; bankers' bills are offered at 108½, and in second hands sell at 108. At these rates specie cannot be shipped as a remittance; but on Saturday over a million went out in the shape of bars and silver coin.

The money market is very easy indeed. Call loans are 5 per cent. and first-class short paper sells at 5 to 6. Foreign merchandise is dull of sale in consequence of the advance in gold. The importations, however, continue heavy. They were again last week over $6,700,000 at this port; exports only $2,397,000. Much is expected of the new cotton crop, which some sanguine estimates figure as high as three million bales; circulars in the bear interest warn the trade not to look for over half that amount. The prospect of the food crops in the West is thus far good, but prices are so high here in consequence of the depreciation of the currency that none of the Western staples can be shipped to Europe except in the face of a loss.

Government stocks continue firm with considerable activity. The railway shares are generally dull. Erie is the only stock in which there is any life. It sold on Saturday as low as 57½. "Puts" at 59 and 60 for thirty days can be bought for one per cent., and the chances of an improvement in the price are thus deemed small. The earnings of the road continue to decline. Other shares are steady, with very limited transactions. The Fort Wayne company have declared their usual quarterly dividend of 2½ per cent. Western Union Telegraph, which was done as high as 64 a couple of weeks ago, dropped to 50 last Saturday, and looks as if it might fall lower.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	June 18.	June 21.	June 25.	Advance.	Decline.
United States Sixes of 1881	106	106	106	....	....
5-20 Bonds, old	103¾	103⅝	103⅛	....	¼
5-20 Bonds of 1865	103	102⅞	102¾	....	⅛
10-40 Bonds	96⅛	96⅛	96⅛	....	...
7.30 Notes, second series	102⅛	102¾	102⅝	....	⅛
New York Central	99¼	99	98⅝	....	⅜
Erie Railway	59⅛	58	58⅛	⅛	....
Hudson River	110¼	112	111	....	1
Reading Railroad	109¾	109	108⅝	....	⅛

GRAND, SQUARE, AND UPRIGHT

PIANOS.

These instruments have been for thirty years before the public, in competition with other instruments of first class makers. They have, throughout that long period, maintained their reputation among the profession and the public as being unsurpassed in every quality found in a first-class Piano.

650 BROADWAY,

AND

CROSBY'S OPERA HOUSE, CHICAGO, ILL.

J. BAUER & CO., Agents.

Bradbury's Pianos "the Best."

Pronounced "THE BEST" by the most renowned artists "SUPERIOR in tone, touch, power, DURABILITY, and elegance of finish." Warerooms 425 and 427 Broome Street, corner of Crosby. Call or send for circular.

WM. B. BRADBURY.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not detracting in the slightest degree from its many positive advantages, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fulness, prolongation, and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

Make Your Own Soap with B. T. BABBITT'S Potash, in tin cans, 70 Washington Street, New York. Pure Concentrated Potash or Ready Soap Maker. Warranted double the strength of common Potash, and superior to any other saponifier or lye in the market. Put up in cans of one pound, two pounds, three pounds, six pounds, and twelve pounds, with full directions in English and German for making Hard and Soft Soap. One pound will make fifteen gallons of Soft Soap. No lime is required. Consumers will find this the cheapest Potash in market.

B. T. BABBITT,

64, 65, 66, 67, 68, 69, 70, 72, and 74 Washington St., N. Y.

MARVIN'S

PATENT FIRE AND BURGLAR SAFE.

Superior to any others in the following particulars:
They are more fire-proof.
They are more burglar-proof.
They are perfectly dry.
They do not lose their fire-proof qualities by age.
Manufactured only by

MARVIN & CO., 265 Broadway.
721 Chestnut Street, Philadelphia.

Send for a descriptive Circular.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

FUNSTON & SCOFIELD,

9 Dey St., near Broadway.

THE NATION.

THE NATION has now outlived a great deal of misunderstanding. Whether they think it good, bad, or indifferent, most people know what it is aiming at, and are able to state pretty clearly why they like or dislike it. We have received such assurances of the interest and satisfaction with which our enterprise is viewed as convince us that we have at least acquired what must form the basis of all permanent success for any such paper as this aims to be—the good opinion and good wishes of those who know best what good writing, clear thinking, and sound criticism are, and to whom the country owes not only the larger part, but the better part, of its fame.

For the guidance of those who may feel disposed to assist us with their contributions, we may mention that the contents of THE NATION will fall nearly under four divisions—or that, at all events, these divisions would have to be kept in mind by anybody writing for it as a volunteer.

1. References to, and concise comments on, the news of the day, with the view of fixing the degree of its importance, and suggesting its bearings upon and relation to the main current of contemporary history.

2. Reviews or comments, whether in the shape of letters or articles upon important events, and upon the utterances of those who are, or are trying to be, leaders of public opinion.

3. Accounts more or less detailed, or discussions of such occurrences in the social, literary, artistic, or scientific world as are likely to interest men or women of education and intelligence. Under this head we do not include mere gossip about nobodies, or advertising chronicles of the sayings and doings of quacks, daubs, penny-a-liners, dilettanti.

4. Critiques of publications or works of art of sufficient merit to make it desirable that the public should ever hear anything about them.

TERMS—$5 per annum; 6 months, $3.

When delivered by Carriers in New York or Brooklyn, $1 additional.

Topics of the Day.

THE "third party," which has given little sign of life for a good many weeks, has just put forth a summons for a general convention. It is to be held in Philadelphia in August, and the delegates who are to meet together in the City of Brotherly Love are to represent all the South as well as all the North. The call is an enunciation of the familiar political doctrines maintained by most of the Democrats and by President Johnson, and as it is issued by the "National Union Club" of Washington city—an organization which contains nearly all the present members of the new political body—we may say that the third party gets its name from one and its principles from the other of the two great parties which already exist in the country. And as these two parties divide between them all the principles which are of the least importance to the settlement of the questions now before the people, it seems clear enough that the history of the new party will be the history of the sharp practice of a few politicians.

H. RIVES POLLARD, the editor of the Richmond *Examiner*, who spells ethics with a *k*, seems to stick to the obsolete "theorique and practique part" of that science as obstinately and amusingly as he sticks to the antiquated orthography. Mr. Samuel James went into his private office the other morning and made a call on his truculent brother-in-law. He unguardedly made certain remarks about Edward A. Pollard. At what point in the Richmond thermometer the mercury was standing we are not informed, but the remarks immediately "led to a collision between the parties." James left the premises, and by and by Pollard, who, we fear, got a thrashing in the sanctum, "having armed himself," sallied forth, and began ranging the streets like Mohawk and like Hawkabite of his favorite hundred and fifty years ago. While he is running amuck, a constable, who apparently "comprehends" him very well, escorts him to a justice, and he is bound over in the sum of $4,000. For the moment we may breathe freely; but the outside public ought to be forewarned if it is as a historian that Mr. E. A. Pollard must be spoken of respectfully. If so, we protest against the Richmond dictator's decrees having any retrospective force.

THE Southerners during the rebellion were literally driven to the wall for paper on which to print their newspapers, and to the next ditch for mint with which to make tea. Another breakfast beverage was made not only from peas and beans, like some of ours, but they also took burnt wheat, corn-bread crusts with sorghum syrup, okra, and dandelions to supply the place of "Yankee coffee." Waistcoats, blankets, and trousers were made from carpets of large and small patterns, and it is easy to recollect the cannon that came out of the church steeples. But one Confederate invention of which necessity was the mother we had forgotten. "H. E. C.," who lived in the South while the war was going on, writes to the editor of the *Herald* about utilizing dead dogs, and gives some striking facts which would justify the establishment of a joint stock company—The Swart Star Slaughter and Sirian Hair Oil Company it might be called. He "found a medium sized, tolerably fat dog to yield a quart of oil." He refined and deodorized some of it, and it made a capital unguent for the purposes of the toilet. In the crude state it was superior to any other oil for curriers' use. The skins of the bull-dog, the Newfoundland, the big cur which is often called the yellow dog, and which is always found in and around the hovels of the poor whites, the mastiff—the "nigger-dog" we hope was tried—all made excellent leather. "H. E. C." has seen boots made from this leather as good as any calf-skin boots. Bone-black and glue can also be got, and altogether it will be a pity if the fifteen or twenty thousand dogs annually put to death in the hot weather in this city and Brooklyn should not be made to furnish something besides manure.

LAST autumn F. P. Blair, an hereditary politician, refused to take the test oath which excluded returned rebels from casting a vote in Missouri. It is not impossible that in thus making himself a martyr and champion of a strong minority of his fellow-citizens he may have had it in mind even then to stump the State, as he has been recently doing, with a view of getting office from the men whom his success would have admitted to the ballot-box. At any rate, he declined the oath, and his vote being, therefore, refused, he brought suit against the judge of election who refused it. For many months oaths have been a cause of great heart-burning in Missouri and of interminable talk. But this case excited a peculiar interest. It was confidently anticipated that the United States Court would pronounce in favor of the complainant. On the contrary, the validity of the oath is affirmed, and the general, who played well, has lost, and lost also the respect of his former companions and friends.

A GOOD deal to the surprise of everybody, the telegraph this morning reports that the bill ordaining universal suffrage in the Federal District was yesterday disentombed from what was supposed to be its last resting place, and put on its passage in the Senate. It is pretty certain that no educational qualification will be insisted on, and it is certain that an amendment is incorporated which denies the right of suffrage to all persons who left Washington during the war for the purpose of aiding and comforting the enemy. This looks as if the Senate were a little less doubtful than they have hitherto been upon the question, whether or not the people are ready to take the extreme ground of the Union party in reference to the matter.

BOSTON is again instructing her sister cities in municipal economy. She opens this year to all classes and both sexes free public bath-houses in different parts of the city, through which the waters of her bay are constantly flowing. It is not so far from Boston to Nahant as from New York to Long Branch, but the luxury of sea-bathing is no longer

restricted to those who can afford to resort to this and other localities. The spirit which suggested this public benefit is the same which founded the free library of Boston, only it is to be noted that the library came first. Here, on the contrary, the obstacles to a library proceed from "the great unwashed," and, perhaps, to conciliate this class of the community with baths is the speediest way to get at our books.

THE right of secession and the perpetuity of confederations are questions, it is found, debatable by monarchical as well as by republican states. Prussia has declared the Germanic Confederation at an end, and Austria has declared it indissoluble; and of course the Federal Diet has sided with Austria. That body ordered the mobilization of the Federal army on the 14th, and Prussia at once declared war and invaded Saxony. On the 16th it was telegraphed from Prague that she had occupied Löbau and Zittau, on Saxon soil, with a view to the capture of Dresden, and, on her own territory, had concentrated at Schkeuditz and Zeitz, for the possession of Leipzig. Communication between Dresden and Berlin is completely cut off. Prussian troops also entered Hanover from the north, and traffic across that frontier was prohibited. Austria's counter movements are not yet known. She is reported to have manifested some anxiety for her Hungarian border. Kossuth had advised his countrymen, from Turin, to wait in patience, and Deák, somewhat enigmatically, told them at Pesth that the future of their country depended rather on fortunate chances than on political combinations. The lines of the Po and Mincio are no longer passable to or from Venetia. There is a grave contingency that the horrors of cholera may be added to those of bloodshed. The disease has broken out in Northern Prussia near the mouth of the Oder.

FIFTEEN hundred women in England have petitioned for the extension of the franchise to widows and unmarried women possessing the needful property qualification. The petition was presented through Mr. Mill, and it is said to be the most sensible and able document of this sort which has yet seen the light. The demand is moderate, and it is supported by arguments which are likely to have weight with those to whom they are addressed, a qualification for which female politicians have hitherto displayed little regard. From this peculiarity the opponents of their enfranchisement draw a strong argument against their claims, treating it as an indication of the total absence of the political sense. The best answer to this perhaps is, that utterly powerless people are generally deficient in logic, and that women will never apply hard sense to politics or anything else on which they can exercise no influence whatever. There is fully as much nonsense talked by French politicians every day as could possibly be produced in a female parliament, and for much the same reason. Frenchmen have never had the control of their own affairs, and half their political speeches are apt to be rhapsody, and the other half twaddle, which is doubtless what the *Saturday Review*, or any other cynic, would say of the utterances on great occasions of women anxious to vote.

AMID the voluminous war news from Europe one little paragraph is quite overlooked, and yet it tells of one of those victories which we are assured belong to peace as well as to war. The makers of the Atlantic cable congratulated themselves, on the 14th, on finishing their labors. To-morrow is the date fixed for the sailing of the *Great Eastern* from Sheerness for Valentia. If hostilities last a couple of months, it is possible we may study their progress with almost as fresh an interest as if we were in London or Paris.

RUSSIAN aggrandizement in the East, which has met with some reverses since entering Bokhara, is again encouraged by a decisive defeat of the Prince of Bokhara, who, in a recent engagement on the 20th of May, attacked the Russians with 20,000 men and 21 cannon. He lost all but two of his guns and inflicted little damage on his enemy. Some idea of the spread of telegraphic communication over the globe may be had from the fact that the news of this engagement reaches America in scarcely more than a month from the date of the event itself.

CONGRESS.

Monday, June 25.—In the Senate, a bill to allow claims of loyal persons at the South for stores furnished to the army was strongly contested. In the discussion of the tax bill, the tax on raw cotton was retained by a vote of 24 to 10, and, after sundry amendments, the bill was read a third time and passed.

In the House, Mr. Morrill reported a bill amendatory of the tariff act; referred to Committee of the Whole on and after Thursday, the 28th. A joint resolution, amending that of June 15, 1866, respecting bounties to colored soldiers, which, by mistake, was restricted to those free at the time of their enlistment, was passed. A message from the President was read concerning the imprisonment without *habeas corpus* of American citizens in Ireland. The House non-concurred in three out of the Senate's six amendments of the army bill, and called for a committee of conference. It agreed, however, to reduce the appropriation for army contingencies from $250,000 to $100,000; to appropriate about seven millions to the Freedmen's Bureau for the next fiscal year, and to require the quartermaster to prefer American products in contracting for supplies

June 26.—In the Senate, the bill to amend and continue in force the bill establishing the Freedmen's Bureau was taken up and passed—yeas, 26; nays, 6. It continues the Bureau for two years, and provides among other things for the equitable settlement of the land-titles involved by Gen. Sherman's famous order. The bill goes back to the House for concurrence in the amendments.

In the House, the bill regulating the transportation of nitro-glycerine and other inflammable and explosive oils, was reported from a committee of conference, and passed. Also, a bill prohibiting any State making discrimination in the rates of pilotage between vessels of different States or against U. S. national vessels, and annulling all such discriminations. The Internal Revenue bill as amended by the Senate was referred to the Committee on Ways and Means.

June 27.—The Senate concurred in the House amendments to the bill regulating the transportation of nitro-glycerine. The bill regulating the elective franchise in the District of Columbia was taken up and discussed, and an amendment making the ability to read and write a necessary qualification was rejected—yeas, 15; nays, 19.

In the House, a bill to prevent smuggling was passed. The tax bill was considered, and the Senate amendment reducing the tax on cotton from five to two cents a pound non-concurred in; also, that allowing gas and railway companies to add the tax to their charges.

THE FREEDMEN.

THE animosities of races are yet bitter at the South and seem to grow more demonstrative as the days go on. In Goldsboro', North Carolina, a commissioner of the town, about a fortnight since, set upon a discharged colored soldier, who, in attempting to escape, was shamefully maltreated by the crowd that had gathered. The mayor refused to receive colored testimony against the assailant, who was accordingly discharged from custody, while the victim was retained. A natural expression of indignation on the part of the colored citizens was the occasion of the mayor's ordering the arrest of all who censured his conduct! Resistance to such an order was inevitable, and bloodshed ensued. Three miles from Memphis, on the 20th, a colored household was attacked by seven armed desperadoes, and though these were finally repulsed with the loss of one of their number, the negroes had three killed and were all more or less injured. On the 19th two colored women were violated by a white man who entered their house. At Charleston, on the 23d, some white and black boys quarrelling involved men on both sides. The ringleaders were arrested by the police, and subsequently three hundred blacks got together and, headed by negro soldiers, marched through the lower portion of the city. A military and police force attacked and drove them from the streets with numerous arrests. In Clay county, Georgia, a sheriff sought to compel a freedman to report to the agent of the Bureau, whereupon the negro stabbed the officer fatally, as is supposed, and was immediately shot dead by the bystanders. In Thomaston, Georgia, several negroes are reported to have violated their contracts, and to have resisted incarceration. A riot was the consequence, in which both whites and blacks lost their lives, but the latter were overcome and imprisoned.

—On the 12th of this month the leading citizens of Oxford, Mississippi, having been impressed with their duty to the freedmen, issued a circular giving some reasons why the latter ought to be educated—even the danger to the Republic of "illiterate voters" being enumerated. Their religious obligations were especially acknowledged, and the immediate result is a Sunday-school with one hundred pupils and twelve teachers.

—The Bureau is transporting the surplus population of the Virginia peninsulas to homes in various parts of the North. The relief to the State thus depleted will be great.

Notes.

LITERARY.

PERHAPS the bitterest pill which the Americans had to swallow in the war of 1812 was the capture of the *Chesapeake* by the *Shannon*. The number and the brilliancy of the naval victories gained over the British had unduly excited expectation, and Capt. Lawrence sailed out of Boston harbor on the morning of June 1st, 1813, with the confidence of an easy victory. His confidence, too, was shared by the whole community, and the news of the disaster was received with wondering incredulity, which speedily turned into dejection and rage, only relieved by the gallant conduct of the *Chesapeake's* crew and the heroic death of her commander. The life of Sir Philip Bowes Ven Broke, Bart., the commander of the *Shannon* on that occasion, has just been written by the Rev. J. G. Brighton, M.D., and although as a book it is very badly put together, it contains some interesting details of the cruise and victory of the *Shannon*. Broke's life was otherwise very uneventful. He went into the navy young, and although he had captured several French vessels and burned a good number of American ships which were easy prey, he had never been engaged in any great action. After the capture of the *Chesapeake* he was laid up by his wound, which caused his retirement, and he lived in seclusion until his death in 1841. The incidents in his life were very few, and, with his characteristic reserve, he had expressed himself very briefly on paper, so that it is not surprising that the chief event of his career occupies about half of the memoir. The whole account of the action given in his journal is comprised in three lines: "June 1st. Off Boston. Moderate. N.W. W. Lawrence. P.M. Took *Chesapeake*." The challenge which he designates by "W(rote) Lawrence" is given in full, and is a fair, spirited production. Nothing particularly new is brought forward with regard to the fight.

—The graduates and students of University College, London, held a meeting on the 30th of May to present a testimonial of plate and books to Mr. David Masson, the late professor of English language and literature in that college, on his being elected to the chair of belles-letters in the University of Edinburgh. Mr. Farrer Herschel presided. Prof. Masson expressed the pleasure with which he looked back on his thirteen years' professorship there, and said that he went to Edinburgh because Scotland was his native country, and he had a natural desire to return there; and that while in London circumstances had prevented his giving the whole of his attention to his professional duties, so that he felt it incumbent upon him either to give up those duties or to exercise them where he could give them his undivided attention. He had chosen the latter course.

—Sir John Bowring is about to publish a translation of poems selected from the works of the popular Hungarian poet, Alexander Petöfi, of whom he gave an interesting account in an essay contributed to the "Gentleman's Magazine." Among the Magyar people his poems are like "household words," and he has as strong a hold on all classes of his countrymen as Burns and Béranger had on the Scotch and French. His genius was very prolific, and there is some difficulty in choosing among so many excellent poems. He died young—at twenty-six—after having passed through every stage of want, at a high position of social and political influence, fighting by the side of Bem. The following is Bowring's translation of "Jo ideje lement a nap:"

"All the earth is wrapped in shadows,
And the dews have drenched the meadows,
And the moon has taken her station,
And the midnight rules creation;
Where is my beloved staying?
In her chamber, kneeling, praying.
Is she praying for her lover?
Then her heart is flowing over;
My beloved! is she keeping
Watch, or is she sweetly sleeping?
If she dream, her dreams are surely
Of the one she loves so purely.
If she sleep not, if she pray not,
If to listening ear she say naught,
Thought with thought in silence linking,
O! I know of whom she 's thinking:—
Think, O think of me, sweet angel,
Rose of life, and love's evangel!
All the thoughts that melt or move thee
Are like stars that shine above thee,
And while shining, to the centre
Of thy spirit's spirit enter,
And there light a flame supernal,
Like eternal love, eternal."

—In *Notes and Queries* a writer suggests a new origin of the name of Gibraltar. "Not far south of Samalout on the Nile rises a precipitous rock from the river's bank, which my dragoman called *Jabal-el-tayir*, from *jabal*, a mountain, and *tayir*, a bird, in Arabic. He stated that there were other eminences of the same name higher up the river. If I remember rightly there is a Gibraltar or *Jabal-el-tayir* on the Gulf of Suez. The Gibraltar in Spain may be derived from the Arabic words *jabal*, a mountain, and *tarik*, a way or passage; and perhaps signified, as originally written, the mountain of or by the passage—*i. e.*, the passage from Africa into Spain. It is equally probable that the first part of the name of the Moorish leader *Tarik-ben-Zeyad* was bestowed on the rock to commemorate his successful landing in Europe."

—In the lists of recent publications the following French historical works appear: "La Vendée en 1793, par E. Bonnemère;" "Marguerite d'Angoulême, Reine de Navarre, et la Renaissance, par V. Luro;" "Marie Antoinette, Louis XVI., et sa Famille Royale;" "Journal Anecdotique tiré des Mémoires Secrets, pour servir à l'Histoire de la République des Lettres (Mais, 1763—Février, 1782);" "Mémoires lus à la Sorbonne, dans les Séances extraordinaires du Comité Impérial des Travaux Historiques et des Sociétés Savantes tenues le 19, 20, et 21 Avril, 1865;" "Louis XV. (1724–1757), par J. Michelet:" the first volume of "Mémoires de Mdlle. de Montpensier, petite-fille de Henri IV., Collationés sur le Manuscrit Autographe, avec Notes, par A. Chéruel;" the third volume of "La France sous Louis XV., par M. Alphonse Jobez, ancien représentant;" and "La Correspondance de Marie Antoinette avec les Empereurs Joseph II, and Léopold II., ses Frères (1775–1794), avec quatre fac-simile originaux," which will reopen the discussion as to the genuineness of the former series of Marie Antoinette's letters.

—The last book of M. Renan, "Les Apôtres," is still a target for the fire of the religious journals of Paris. The *Revue du Monde Catholique*, founded by Louis Veuillot, in the number of the 10th of May contains an article on this book by M. Laserre, which is so bitter and malignant as to have excited a sentiment of repulsion even in the bosom of the clerical party. M. Georges Seigneur, editor of the *Croisé*, itself no tender journal to its adversaries, has felt himself obliged to publish in his paper the following note on the violent refutation of M. Laserre, which adds strength to what for some years has been said of the strange excesses of religious journalism: "The article of M. Laserre begins with two pages of such impropriety, to say nothing more, that it is impossible for us not to protest against it. . . . For the honor of Catholic polemics we are unwilling to let such an occurrence go without loudly expressing the painful impression which it has made upon us."

—As a specimen of the liberty allowed in the Catholic ranks to those who do not choose to agree, even in matters foreign to faith, with the official clergy, the case of the Abbé André, curé of Vaucluse, can be taken. He had published a dissertation entitled, "Les lois de l'Eglise sur la nomination des curés," a subject certainly very inoffensive. The book was, of course, referred to the *Index*. After a careful examination, the Sacred Congregation made the singular decision "that there was no reason for putting the book on the *Index*, but that the author, notwithstanding, deserved not only a mark of blame, but even a severe admonition." The crime of which the Abbé André was guilty was that Gregory XVI., by a rescript of May 1, 1845, and Pius IX., by a judgment of the congregation of bishops, had wished to reserve this discussion to the Holy See. The worthy pastor must disavow his book, on an open question, and receive a public reprimand. Yet it is called calumny to say that Catholicism smothers all discussion.

—A collection of Greek MSS. which, until now, have been hidden in the archives of Naples and in the monasteries of Monte Cassino, Cava, and other monastic buildings, has lately been published by Signor Francesco Trinchera, superintendent of the archives of Naples. The work is published in one volume quarto, and is entitled "Syllabus Græcarum Membranarum quæ partim Neapoli in majori tabulario, et primaria Bibliotheca, partim in Cassinensi Cœnobio ac Cavensi et in Episcopali Tabulario Neritino jamdiu delitescentes, in lucem prodeunt." In the first part Signor Trinchera, beginning with the Hellenic origin of the many cities and towns of the southern provinces, sketches a brief history of "Grecesino" under the Romans, under the dominion of the Goths, under the emperors of Byzantium, and successively under the Norman, Swabian, and Angiovine kings, concluding with a report of the researches and labors which he and the learned men connected with him in the archives of Naples have made in order to collect and explain the MSS. of which this volume is a syllabus. The second part contains three hundred and fifty-two Greek MSS. (with a Latin translation) from the ninth to the thirteenth centuries. The third part is composed of the reproduction in fac-simile of numerous extracts from these MSS., with the signatures and seals of the times, and a complete index of words and things treated of in the MSS. In the innumerable details which these documents supply of private and civil religious life in the Middle Ages is brought to light a phase hitherto unexplored of that mixed society of Greek and Italian, Roman and barbarian, Catholic and Byzantine, that inhabited Southern Italy.

—One of the most welcome announcements of the season is the poems of Miss Christina G. Rossetti, which the Messrs. Roberts, of Boston, are to republish, with four designs by her brother, D. G. Rossetti. The volume is to match the same publishers' edition of Jean Ingelow's poems, and as two poetesses of the new day of English poetry they deserve to be classed together. But in our opinion Miss Rossetti far transcends her rival in genius, and when the American public have had an equal opportunity to appreciate her quality, we are confident they will agree with us. She uses words as her Pre-Raphaelite brother uses the brush, with remarkable vigor, and with all the simplicity and homeliness of truth. What we cannot speak knowingly of is her range of themes, and on this account the collection of her scattered poems under one cover will be welcome. "Macmillan's Magazine" has latterly been her principal channel of communication with her admirers.

MORALITY AS THE RELIGION OF CHINA.*

If in journeying to-day to Egypt, and ascending the Nile, we found there the same people whom Herodotus found so many centuries ago—the people who built the pyramids and filled the temple-palaces of Karnak and Luxor with the wonders of their monstrous art—we should feel doubtless the same awe with which the lively Greek was inspired as he walked the now speechless streets of Memphis or of Thebes, and we should take much greater pains to satisfy a more eager curiosity as to the origin and history of a race possessed of so much knowledge, and at the same time misled by so much superstition. Yet beyond the Indian Ocean there exists at this moment a nation as intelligent and ingenious, whose origin, if we could trace it, would probably be found to date from a period preceding the rise of the Egyptian civilization. In the general history of mankind, indeed, there is hardly a fact so unique as this long and solitary existence of the Chinese; for, as they go beyond tradition in their extreme antiquity, so all along the course of history they appear always as a self-developed, peculiar people, owing nothing to foreign influence, though often subjugated by foreign invaders.

But, without seeking the causes of this singular tenacity of life, it is a fact, perhaps not sufficiently considered, that their entire want of what we call religion is the strongest evidence of their great antiquity. For it is only as a civilization grows old that the religion which gave it life dies out. It was not until the Greek genius had touched the limits of its power that it began to question the popular mythology; it was not till the task of conquest had been accomplished by Rome that the stately ceremonial of the Roman temples ceased to have a hold upon the general mind; while the finer thought of the early priests of Egypt was almost wholly lost to the knowledge of men as soon as the Egyptian civilization, instead of being aggressive, relapsed into that unbroken monotony which characterized it for centuries before the Egyptians became Christians from mere disgust at the grossness of their ancient worship.

With the example of China before us, however, it might be a question how long the ancient civilization would have survived if the efforts of the Alexandrian philosophers to revive a purer morality had been successful, if the doctrine of the Stoics had been less severe or that of Epicurus better understood. But just as fast as the ancient faith broke up, its place was taken by another of a higher type and an enduring character. Marcus Aurelius had no time to become the Confucius of the Roman world, for the doctrines of Christianity were sweeping the ancient civilization away from its old basis. In China, however, the case was different. Whether from the vast antiquity of its civilization hiding the earlier growth of the religious sentiment, or from the early tendency of the Chinese mind to purely moral doctrine, there is no period known to us when the religious predominated over the strictly intellectual element in China; although the fact that there must have been such a period cannot be doubted by one who has studied carefully the historical conditions of the development of the human mind. Hence the great length of time which must have elapsed after the Chinese civilization had been fairly established before such a man as Confucius could have been received as a universal guide. For, besides having no religious doctrine, he had very faint conceptions of a future life. He admitted the fact of such a life, indeed, in a general way; but the whole spirit of his teaching is limited to this world—which again shows how old the Chinese must have been when he appeared, for it is only as a civilization has long been stationary in its maturity that the mind comes to occupy itself much more with this life than with the next.

At a time, therefore, like the present, when the spirit of philosophical enquiry is so wide-spread, it is interesting to observe what success a nation so cultivated and so ancient as the Chinese has had in attempting to get on with morality instead of religion; for with no other people, we may add, have the eternal laws of goodness and justice and truth been so completely developed in practical formulas, of which the little treatise of M. Martin furnishes a compendious statement. But this substitution of morality for religion exists, it should be borne in mind, chiefly among the middle and higher classes; the lower classes have taken up for the most part with the worship of Buddhism, which came in about the same time, perhaps, with Confucius, and which must, no doubt, be looked upon as a religion. Preceding Confucius, however, by half a century, at a period when China was in a state of political and moral dissolution which would have made it an easy prey to the Tartars if a powerful reaction had not set in, the doctrine of Lao-tsen was the best preparation through the excess of its spiritualism for the more practical truth which Confucius inculcated. To disengage the soul from the trammels of the body, to annihilate the passions, and finally to attain absorption in the contemplation of the supreme reason, was the object of Lao-tsen. But the gentleness and resignation and love which breathe through his philosophy, though they led on the one hand to a beautiful charity, led also on the other to a supine indifference. At an epoch of decadence when the luxury and cruelty of the rich brought misery and oppression upon the poor, the asceticism of Lao-tsen was a natural remedy. But a philosophy which makes the perfection of man to consist in throwing off his corporeal nature condemns itself in the end to impotence and decay.

He who knows men, said Lao-tsen, is prudent; he who knows himself is enlightened. Confucius knew men—few philosophers have known them better—and from the middle of the sixth century before Christ, when he was born, to this day his glory survives among the nation he taught; his precepts are written in letters of gold all over a great empire, and bear fruit in numberless lives. Unlike the teachers of almost all other religions, the enemy of mysticism, he claimed no supernatural power; he founded no religion and invented no philosophy; he was neither a legislator, nor prophet, nor king. But, recognizing in man a moral and social mission here on the earth, he attempted only to comprehend its importance, and to discover the means for accomplishing it. And that means he found in the moral nature of man, in the sentiments of goodness, and beauty, and justice, and truth, which he reduced to maxims for the regulation of the conduct. He recognized the existence, indeed, of a superior principle of intelligence; but the basis of his theory of duty, his fundamental dogma, did not have reference to another life and a higher being, but to this life and to earthly relations. That basis was filial piety, exaggerated even to fanaticism; for, as others conceived a divine personality, of which they could not explain the nature, and so called it a mystery, Confucius conceived a moral ideal inaccessible to the efforts of man, and called it perfection. Filial piety towards the Emperor and towards parents is thus, to-day, the dominant cult in China; and so strong is the sentiment of its importance that the titles of the mandarins are not transmitted to their sons, but ascend to their ancestors.

Conscience to illumine the soul, intelligence to distinguish good from evil, humanity, which is justice and courage in the heart—they were the faculties upon which Confucius relied. His defect was that, being above all things a man of observation and the world, and finding that men were universally given to care more for themselves than for others, he made selfishness a principle of life, although within necessary limits, for "he whose heart is right," he said, "and who has for others the same regard which he has for himself, does not depart from the moral law nor the duties prescribed to others, and *does not do to others what he would not have others do to him.*" He saw the facts of life, but he did not investigate their causes profoundly. He passed days without food and nights without sleep in meditation, but he learned, he said, really nothing from it; that is, by his own confession, he never lifted himself above this world to behold the spiritual grace which enfolds and illumines it.

Thus, under the influence of this teaching, the character of the Chinese has become substantially positive. They seek the satisfaction of material interests only. Inaccessible to theories, they are content with their ancient discoveries, because these discoveries afford them the means to gratify all their wants. Having lifted themselves very early by their inventions into a position superior to that of other nations, they have ceased to progress, because the necessities of their earthly nature having been once appeased, they have no motive to purify or exalt it by the study of a higher ideal, of which they have no conception. Thus, as M. Martin says, the Chinese civilization resembles the figures on their vases, which are remarkable for the fineness of their lines and their brilliant coloring, but express no sentiment or passion.

And thus it is that the Chinese philosophers have no knowledge of love transcending sex, because their conception of life does not go beyond its materialism; and they seldom speak of the relations of the sexes except with great reserve, for woman was something apart from man, partaking

* "La Morale chez les Chinois, par Louis-Auguste Martin, Auteur des *Civilisations primitives en Orient.*" Paris: Didier et Cie., Libraires-Editeurs.

rather of the character of the animal creation. The birth of a daughter was a misfortune, as it is to-day in China a malediction. Is a son born? says one of the ancient books, he is laid upon a bed and wrapped in rich stuffs, for the master, the chief, the sovereign is born, and to him empire belongs. Is a daughter born? she is laid upon the ground and wrapped in a piece of common cloth, for there is neither good nor evil in her; let her learn how to prepare the food of the family and how to avoid being a charge upon her relations. And even Confucius consecrates by his authority this subjection of woman, this degradation of the wife which strikes at the root of social order.

If the Chinese practised faithfully, indeed, the traditional morality of Confucius, they would be one of the most just and liberal and compassionate of nations; for there is hardly any theory of morals so complete, so characterized throughout by good sense, as theirs. And so the ancients, if they had lived as Socrates and Plato taught, would have been among the wisest and purest nations. But it is just at this point that human nature has thus far broken down. The moral law in China makes a great deal of private and public duties, but there is little social justice; it affirms that the obligations of men are reciprocal, but it does not sanction them; it blames the abuse of power, but cannot prevent it; it declares every one responsible for his own deeds, but makes the son answer for the sins of the father; it preaches humanity, and preserves slavery; it exalts filial piety, and leaves the wife and mother and daughter in a condition of servile degradation.

Thus half selfish, half indifferent, the Chinese are crafty, deceitful, overbearing with the weak, servile with the strong; indisposed to fight, but so eager for revenge that they will drown themselves in their enemy's well in order to bring down upon him the punishment of the law. Whatever, therefore, may be claimed for the purity of the Chinese morality in its higher expression, it must be admitted that the practice of it is a failure, for it has no inspiration; it stops with reason, and can find no explanation for sentiment or devotion. It eliminates the spiritual, and so confesses its inability to deal with the whole problem of life, and therefore to found durable institutions; and, in point of fact, the signs of decay are visible to the close observer throughout the empire.

The philosophy of history, then, if it teaches anything, teaches that faith in a continually ascending life is necessary to the preservation of a civilization; and it is in our modern civilization alone that this condition of permanence seems to be found.

POEMS OF GEORGE ARNOLD.*

It is to the honor of Ticknor & Fields that a volume of poetry with their imprint is sure of notice, and has almost a right to claim careful attention. Set aside the well-earned reputation of that house, and, unless one happens to be an adept in the philosophy which finds sermons in stones and moralizes everything, there is almost no reason for noticing this volume.

The constant succession, constant as the appearing of new false blossoms with each returning year, of those ineffectual poetic natures which, confusedly feeling within them all the stir and perturbation of spring, are yet destined to wither and drop off abortive, incapable of coming to any fruit of poetry, is really pathetic. Vanity, pretension, affectation, humbug of many sorts, with little of good to counterbalance, it is usual to find accompanying the display. But after all it is not necessarily or exclusively ridiculous, often as it is presented to us in that light, although, practically, the application of ridicule is well enough; haply some may thereby be saved from perseverance in a vain attempt, and the rest of us so be spared the sight of weakness exposing itself—a spectacle, be it said for the credit of human nature, one of the most uncomfortable, even painful, that man as a social animal is called on to endure, and which it is no wonder he tries by any fair means to prevent.

In the sense in which we may call poets all men who are not duller than the clod, hopelessly imbruted—and, perhaps, in this meaning there are no total exceptions among all the tribes of men—George Arnold was a poet. The power, and beauty, and harmony, and mystery of nature—of nature in the widest signification of the word, the poetry of the microcosm as well as of the external world, the poetry which is everywhere, in all things, of which life is made, he, like others, could in part discern and could intermittently feel. To express it, to do hardly anything more than vaguely express his feeling of its existence, is beyond him, and although in every piece which he wrote there are indications of poetic sensibility, he has left behind him no single piece worthy the name of poem. He could not. He is no longer living, and he died when only thirty-one years old; but if at that age it was soon to do much, it was very late to be making beginnings, and, judging him by this book, before he could commence poet he would have had to begin over. There is no wealth of fancy in it, no depth of thought, no strength of passion, no peculiar felicities of rhythm or diction, no force of imagination, nothing but that weak, half-morbid, melancholic sentiment of regret which preys upon the baffled poet who, having mistaken aspiration for inspiration and discovered his mistake, is without strength of judgment and power of self-restraint to impose silence on himself and set himself to labor in a new field. Mixed with this feeling is another, allied to it, which occasionally speaks in the verses—remorse, profitless repentance, real perhaps, perhaps feigned and poetical only, for years thrown away, opportunities and energies wasted in riotous or indolent self-indulgence, every labor undone, every duty disregarded, life left without dignity, till, as he says in "Recrimination:"

> "Till the glass of your life is darkened, and darkly through it you see
> Broken and ghastly fragments of duty and destiny."

Then again, seeking refuge from this feeling, he naturally falls often into a cynical indifferentism which scorns fame, wealth, goodness, and badness, smokes a pipe in laziness, and pets a terrier—Jack, of course, being kinder and more faithful in affection than man or any woman, and the smoke of the killikinick as substantial and as satisfying as the world of pleasure and business and human endeavor.

Evidently this is not a rare character which we have been describing, but one which is familiar and ordinary. To give it, with its narrow range and small depth and commonplaceness, such expression as should be noticeable among poetical utterances, would require far more than its own, more than common, force of genius. It will be easy, letting Mr. Arnold speak for himself, to show that this he does not possess:

> "The river down to the ocean flows
> By reedy flats and marshes bare;
> And the leafless poplars stand in rows
> Like ghostly sentinels watching there.
>
> "An osprey sails with wings spread wide,
> Down-slanting from his even flight,
> To a sedgy spot, where the falling tide
> Has left some kind of drift in sight.
>
> "A blackened mass, by the tide left bare,
> In the tangled weeds and the slimy mud.
> The osprey shrieks as he settles there,
> And a deathly horror chills my blood."

This poem is from "Drift," an idyl modelled after Tennyson's "Brook," blank-verse alternating with rhymes. The rhymed portions, like the songs in Tennyson's "Princess," having a not too obvious connection with their context, do not suffer greatly by being separated and offered alone for judgment. These verses seem to us to have very little in them that makes them worth reading or worth writing. They are smooth and easy; the picture-painting is not too bad, unless in that, as in other branches of poetry, we call barely good enough too bad; the dim suggesting of horror is not a new device, but the suggestion is well enough conveyed, except that almost everybody knows, and those who do not know should say nothing about it, that the osprey never leaves its business of catching fish to gorge itself on carrion. It is a pretty word in a verse, however. But these images have been used often, the sentiment is worn threadbare, the whole thing is the utterance of proverbially unendurable mediocrity.

"The Lees of Life" is another average specimen of the author's powers:

> "I have had my will,
> Tasted every pleasure;
> I have drank my fill
> Of the purple measure;
> It has lost its zest,
> Sorrow is my guest,
> O, the lees are bitter—bitter,—
> Give me rest!
>
> "Love once filled the bowl
> Running o'er with blisses,
> Made my very soul
> Drunk with crimson kisses;
> But I drank it dry.
> Love has passed me by,
> O, the lees are bitter—bitter,—
> Let me die!"

Mr. Arnold was for several years a successful writer for the press; he was a clever humorist, as one in each dozen or so of his "McArone Papers" makes evident; as we read the preface containing a biographical notice of the kind called "appreciative"—usually so called because they conceal one-half the character of the subject, and unjustly estimate the other half—we were glad to believe, without abatement, all that Mr. Winter says of the kind heart of his friend, of his generous sympathies, his integrity and honor. But these qualities and powers were far from making him a poet, which Mr. Winter, and we fear not a few others, may suppose him to be. We cannot think his friends or his publishers have done judiciously in making for him a claim which, it is fair to suppose, if he were living he would not make for himself. He knew, with grief perhaps, that his ideal was far above his reach.

* "Drift: a Sea-shore Idyl, and Other Poems. George Arnold." Boston: Ticknor & Fields. Pp. 177.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

TO OUR READERS.

THE second volume of THE NATION closes with the present number. In the next volume, commencing with July 5th, we shall return to the weekly issue, as that which experience has shown to be best adapted to the public taste and requirements in a journal of this character.

It is confidently believed that every feature of the paper which has hitherto found favor with the public, will, during the coming year, be marked by still greater excellence.

One attraction of the new volume will be a series of papers from Mr. G. P. Marsh upon the last edition of "Webster's Dictionary"—one or more on each letter of the alphabet, and containing word histories, and other notes and comments, of the highest interest and value not only to those who use the dictionary, but to all students of philology.

We have made it a rule, from which we have only rarely, and then under peculiar circumstances, departed, not to append the names of the writers to articles appearing in THE NATION. We have done so because it is notorious that an article of which the author is known is hardly ever judged on its merits. If he is still obscure, most people will not take the trouble to read what he says; if he is famous, they will devour the veriest twaddle that comes from his pen, and insist on fresh supplies every day. Anonymous writing has its disadvantages, but it is in politics, and too often in literature, the only writing that is fairly considered. Many readers have, however, expressed so strong a desire to know if not who wrote particular articles, who did write for THE NATION at all, that we append a list of most of those who have favored us with contributions in one form or other during the past year:

REV. LYMAN ABBOTT; PROF. WILLIAM F. ALLEN; EDWARD ATKINSON; W. P. ATKINSON.

ROBERT D. BENEDICT; EUGENE BENSON; JOEL BENTON; JAMES T. BIXBY; MISS ANNA BLACKWELL; JOHN BONNER; F. BOOTT; CHARLES LORING BRACE; CHARLES D. BRAGDON; PROF. WILLIAM A. BREWER; CHARLES ASTOR BRISTED; ROBERT A. BURCH; J. H. BUTLER.

EDWARD CARY; MISS PHŒBE CARY; REV. J. W. CHADWICK; MISS SARAH D. CLARK; C. B. CONANT; CHARLES T. CONGDON; REV. J. L. CORNING; CHRISTOPHER PEARCE CRANCH; W. E. CROSBY.

HON. HENRY WINTER DAVIS; JOHN R. DENNETT; EDWARD DICEY; A. DICKERMAN; THEODORE DWIGHT.

PROF. CHARLES W. ELIOT; SAMUEL ELIOT; REV. GEORGE E. ELLIS.

JUDGE TIMOTHY FARRER; GASTON FAY; SIDNEY GEORGE FISHER; JOHN SAFFORD FISKE; CHARLES L. FLINT; J. T. FOARD; J. IRVING FORBES; REV. O. B. FROTHINGHAM.

WM. LLOYD GARRISON; W. P. GARRISON; PROF. D. C. GILMAN; EDWIN L. GODKIN; PROF. GEO. W. GREENE; PROF. E. W. GURNEY.

DR. WM. A. HAMMOND; REV. EDWIN HARWOOD; REV. JOSEPH HAVEN; CHARLES C. HAZEWELL; MICHAEL HEILPRIN; ROBERT J. HINTON; MRS. JULIA WARD HOWE; WILLIAM D. HOWELLS; MRS. H. HUNT.

HENRY JAMES; HENRY JAMES, JR.; OLIVER JOHNSON; R. A. JOHNSON.

FREDERIC KAPP; A. W. KELSEY; MRS. SARAH P. KING.

CHARLES LANMAN; AUGUSTE LAUGEL; HENRY CAREY LEA; REV. JOSHUA LEAVITT; CHARLES GODFREY LELAND; BENJAMIN F. LEWIS; PROF. TAYLER LEWIS; DR. FRANCIS LIEBER; T. R. LOUNSBURY; PROF. JAMES RUSSELL LOWELL.

PROF. D. H. MAHAN; MRS. JESSÉ WHITE MARIO; HON. GEORGE P. MARSH; J. K. MEDBURY; E. W. MORTON.

REV. B. H. NADAL; CHARLES ELIOT NORTON; CALEB C. NORVELL.

FREDERICK LAW OLMSTED.

MISS S. H. PALFREY; FREDERICK B. PERKINS; WILLIAM S. PHILLIPS; PROF. JOHN NORTON POMEROY; GEORGE E. POND; PROF. NOAH PORTER; S. POWERS.

EDMUND QUINCY.

JAMES REDPATH.

FRANK B. SANBORN; DR. FREDERIC SCHUTZ; EUGENE SCHUYLER; ARTHUR G. SEDGWICK; HENRY D. SEDLEY; THOMAS G. SHEARMAN; FRANK SHELDON; PROF. GOLDWIN SMITH; A. R. SPOFFORD; EDMUND C. STEDMAN; C. J. STILLÉ; W. J. STILLMAN; RICHARD HENRY STODDARD; RUSSELL STURGIS, JR.

BAYARD TAYLOR; DR. FOSTER THAYER; REV. JOSEPH P. THOMPSON; THEODORE TILTON; PROF. H. W. TORREY; N. TOURGUENEFF; REV. J. T. TUCKER; H. T. TUCKERMAN; MOSES C. TYLER.

HENRY VAN BRUNT; AUBREY DE VERE; HENRY VILLARD.

C. W. WAITE; REV. J. H. WARD; GEO. CABOT WARD; SAMUEL G. WARD; HERMANN J. WARNER; W. T. WASHBURN; JUDGE F. WAYLAND; CHARLES WELFORD; C. S. WEYMAN; PROF. W. D. WHITNEY; JOHN G. WHITTIER; DR. JOHN WINSLOW; CHAUNCEY WRIGHT.

HINTS FOR FOURTH OF JULY ORATIONS.

DURING the eighty years of our independent national life we have produced but one great publicist, Hamilton, but one decided genius in literature, Hawthorne, but one in art, Allston, and only two great natural philosophers, Franklin and Rumford, and of these two Rumford spent the better part of his life and did all his scientific work in Europe. And as the quality of American contributions to literature and science has been, on the average, low, so has their quantity been small. The annual literary and scientific product of the people of the United States is not the twentieth part of that of any other civilized people. We read voraciously, but the bulk of our reading is of foreign origin. This is as true of our periodical publications in all departments of science and literature as of the books we consume. Reprinted or translated books and articles constitute ninety-nine hundredths of our reading matter. This aspect of our national life is humiliating, and has often suggested to sceptical minds, both at home and abroad, certain curious doubts concerning the effect on literature and science of a state of society in which there are neither depths nor heights, but only one common level.

Acknowledging our inferiority in this regard, and leaving it to the future to demonstrate the real influence of republican institutions upon science and letters, we may find a full well-spring of consolation and hope in recalling the wonderful applications of science and the inventions of fundamental importance which the world owes to Americans of this generation. We do not now refer to the innumerable ingenious devices for economizing time and labor which form a very characteristic product of the Yankee mind; we propose to enumerate only those really great inventions which are of universal application, and which are everywhere recognized as American.

First upon this catalogue shall be named the practical use of anæsthetic agents. In the whole history of medicine and surgery there are but two or three discoveries which can take rank with this. Vaccination is the best parallel. The property possessed by ether and divers other substances of producing insensibility had been known to a few isolated philosophers for some time, though this property was undoubtedly rediscovered in this country. Neither was the idea of applying these agents to the relief of pain a new one. Ether itself had been before recommended for this very use. Americans demonstrated that ether could be safely administered in quantity sufficient to produce complete unconsciousness during many minutes, and that no evil effects whatever followed a prolonged inhalation of the vapor. American audacity and perseverance changed what had been only a scientific suggestion, an ingenious idea, into a practical and most beneficent reality. Who can conceive of the infinite load of misery which this invention has lightened? It is not only that it delivers poor human nature from the actual pain of the knife and saw, from the pangs of child-birth, and the physical agonies of death—it delivers also from the horror of anticipated pain. The discovery will always remain one of the chief glories of this generation.

The vast extent of our Western wheat-fields and the high price of

labor in our sparsely settled territory guaranteed a rich reward for all successful applications of machinery to agriculture. The actual introduction of horse-reapers is an American achievement, and one of the first importance not only to America, but to every other country in which agriculture is carried on upon a large scale. Accordingly, we find that the American reapers have been copied, modified to meet varying conditions, and not seldom spoilt, by the mechanics and agricultural engineers of all the nations of Europe. With the reapers should be mentioned the sowing, raking, hulling, and thrashing machines, which play so important a part in American farming. Agricultural work is the simplest and coarsest of all forms of labor, and yet must be the occupation of the vast majority of the people. The inventions which demand more skill from the farmer, which increase his head-work and diminish his hand-work, which relieve his muscles but exercise his mind, do much to elevate and educate the class which must always constitute the great bulk of the nation. They strengthen the republic.

Another purely American invention of the first importance is the sewing-machine. This very recent invention has already increased tenfold the potential production of every trade which uses a needle, and has emancipated American women from that never-ending toil with the needle which still oppresses all but the richest and the poorest of other lands. It is by no means possible to predict, as yet, the full effect of this wonderful invention, but we may be sure that twenty years hence hand-sewing will be as curious a sight as is now hand-spinning, and that the next generation will no more use hand-made garments than we use wheat-flour ground between two stones after the manner of the Pompeians. We see the Italian women to-day using precisely the same distaff with which the three Sisters spun their fateful thread. The American women of this generation have seen the beginning of a change the like of which has not come upon humanity in thousands of years—a change which is to affect deeply the domestic habits and social customs of the race. This great revolution dates from the invention of the American sewing-machine.

A complicated machine, like a reaper or sewing-machine, embodies generally, with the one idea which is new, a number of ideas which have become the common property of mankind. The needle with the eye in the point was new, but the treadle, the wheels of different diameters, the cam, and the shuttle were but applications of others' thoughts become common property. Not so with the next discovery on this remarkable list. When melted rubber cools it remains so soft and sticky as to be incapable of any useful application. Owing nothing to science, borrowing no hint from the experience of others, an American was found patient enough, and, let it be added, reckless and improvident enough, to spend the better part of a lifetime in mixing one substance after another with hot rubber, until at last, after many years of purely empirical seeking, he found a substance which, when melted with rubber, yielded a plastic and adhesive mixture that on cooling lost its stickiness, but retained its elasticity and toughness. The so-called *vulcanized* india-rubber is a mixture of sulphur and rubber, in proportions which vary according to the use to be made of the product. This useful substance is now known and used the world over, though it is not everywhere recognized as an American invention. Its applications are almost infinitely various; there is hardly an art or trade in which its elasticity, plasticity, toughness, or water-proof quality has not found useful application. The mechanic, the mariner, the physician, the chemist, the house-wife are all deeply indebted to its admirable qualities.

Since the steam-engine no invention has had such power for good and evil as the electric telegraph. America had not much to do with the accumulation of the scientific knowledge which made the telegraph possible. Our acquaintance with the principles of electricity and magnetism was the slow growth of several generations; the history of the development of the scientific principles, and of the invention of the philosophical instruments, which were necessary to the telegraph, makes distinguished mention of but one American name, a name still held in high honor among those of the most eminent living scientists. The idea of the telegraph had been entertained by many minds—little telegraphs had been actually constructed and worked as scientific toys or curious experiments—but it was reserved for American sagacity and enterprise to put in practice upon a large scale the accumulated knowledge on the subject, to realize the importance of the revolution a practical telegraph would work, and to make a mechanical and commercial success of what had before been a scientific curiosity, a philosophical plaything. It is this actual realization of an idea perhaps not new, this demonstration of value and power, which is often the chiefest part of a great invention. The science involved in the telegraph was chiefly European; the idea of the telegraph was not ours, but the practical application of the science and actual realization of the idea were purely American. The steam-engine and the telegraph are political powers—they make the American Union possible. Boston and Philadelphia were as far apart eighty years ago as New York and San Francisco now.

These great agencies, steam and electricity, created a new want, and made necessary a supplementary invention. Why get news hot from the event, why send the newspaper by steam over the face of the country, if it must take a week to print a daily paper? The cylinder-press, which strikes a thousand copies an hour, was a fit gift to the world from the land which introduced the telegraph. American cylinder printing-presses are used throughout the civilized world, wherever large communities consume the daily newspapers by tens of thousands. This invention was not the result of a single brilliant conception, not the embodiment of a sudden inspiration, but rather the result of patiently combining and improving ideas and methods not absolutely new, but new in combination. It is not the less on this account a great contribution to the resources of modern communities.

We close this catalogue with the mention of an invention which has justly reflected great honor upon the American name in Europe, and which is truly touching in contrast with the brilliant successes which we have already enumerated. Most of the apparatus by which the blind are taught is of American invention. The whole system of printing for the blind, the peculiar types, paper, and presses employed, the maps, globes, and slates which are used, both in this country and in Europe, are the product of the patient study and devoted skill of an American inventor. It is not many years since the British and Foreign Bible Society caused their Bible for the blind to be printed at South Boston, Massachusetts. Nothing can exceed the ingenuity exhibited in designing and executing the mechanical contrivances by which touch is made to do the work of sight in conveying knowledge. We have adduced this beautiful series of inventions to illustrate the fact that American inventors have not only worked successfully for the bustling, laborious, active world, not only for fame and money, but also in behalf of the suffering blind, who, lacking a sense, have fared hardly, these thousands of years, in the struggle for life, and only in this generation have been able to enjoy something like the same opportunities of intellectual and spiritual instruction which those who have sight enjoy. It is fitting that the name of the inventor of this apparatus of instruction for the blind should be quite unknown to the public, and that he should have had no reward but that of the consciousness of having made many happy.

The greatest of American inventions must not pass unmentioned—our political institutions, the product of the common sense and practical Christianity of a people who have been free for many generations. Our contributions to political science bid fair to prove of enormous value, but of course until other nations have more fully reaped the benefit of them we shall not receive for them the meed of honor which will one day be awarded us. Most foreign nations still look on our political system with the doubt and suspicion which usually greet untried inventions.

THE MAINE CONVENTION.

The Maine Union State Convention was held at Bangor on Thursday, June 21, and nominated Brevet Major-General Joshua L. Chamberlain, of Brunswick, for governor. For two months or more previous to the meeting of the convention there had been an active and somewhat bitter canvass of the claims of the several nominees for the position, which may not be without its lessons to the country at large. Several gentlemen had been mentioned in connection with the nomination, but the contest was finally narrowed down, by the withdrawal of

their names, until it lay between General Chamberlain and the Hon. Samuel E. Spring, of Portland. The former was popularly designated as "the soldiers' choice," the latter as "the politicians' candidate." The vote in the convention on the first ballot stood 599 for Chamberlain and 438 for Spring, and the nomination was then made unanimous.

The campaign was inaugurated early in April last, when the Bangor *Whig* suggested the name of Mr. Spring, and urged his claims for the nomination. This action on the part of the *Whig* caused some excitement, not wholly unmixed with surprise, General Chamberlain being a native of Brewer, a small town adjoining Bangor, and always claimed by Brewer and Bangor as one of their own guild, although, as a professor in Bowdoin College, he has for some years resided in Brunswick, where that institution is located.

General Chamberlain's name was first publicly associated with the nomination by the Bangor *Times*, although he had already been frequently mentioned in private. The *Times* is one of the very few newspapers in Maine which, previously Republican, have recently sided with President Johnson in his policy as opposed to that of Congress. This fact was calculated to injure General Chamberlain's prospects with the loyal, Union-loving voters of the State, who are almost unanimous in their support of Congress so far as it really endorses and endeavors to carry into effect the principles of "the Radicals." For in the Dirigo State there is no faint-hearted, half-way support of Radical measures, as the canvass as well as the results of the convention abundantly testify. But the doubt in regard to General Chamberlain's position on the great national questions of the day was eagerly seized upon by the advocates of Mr. Spring, and the papers devoted to his interests teemed with articles notable for insinuations and innuendos rather than direct charges. Had they been able to prove the charge against him, Gen. Chamberlain's chances for the nomination would have been quickly lost.

But while these insinuations were being so freely published, there appeared in print a private letter from the general, written to a comrade in arms, Major-Gen. C. H. Smith, which, the *Times* asserted, "spiked that gun before it was loaded." For the *Times* evidently appreciated the fact that no man not fully in accord with the popular sentiment could possibly receive the nomination. This letter, coming from a gentleman who has now been once more prominently brought before the country, is devoted to a statement of his position as regards the questions of restoration and reconstruction, and from it we quote the following:

"In the twelvemonth that has elapsed [since the close of the war] that progress has not been made which we had so fondly hoped in realizing the benefits of our dear-bought victory. We fought for that 'more perfect Union' which the Constitution announced as its object; we fought for the completion of those great ideas which inspired the souls of our fathers; for the extirpation of that fatal Calhoun heresy which would destroy the very existence of our nationality, and in defence of a united and indivisible country. We fought for liberty in its widest and best sense. In the language of an early Congress, 'the rights for which we contended were the rights of human nature.'

"If we fail in attaining these ends, then was the blood of our heroes poured out in vain, and our treasure worse than wasted. If this war has taught any one lesson more imperatively than another, it is that we should be slow to trust those who have been disloyal to the country, and that we should do justice to those who stood by her in the hour of danger and trial. It seems little else than absolute madness to hasten to reinvest with political power the very men who precipitated upon us the horrors of civil war; and little less than cowardly wickedness to turn our backs upon the millions whose humble and despised condition did not prevent them from befriending the country when it was most in need of friends. And yet this very madness and this very wickedness constitute to-day the main features of a policy urged upon the country with the full strength of the party which, pretending to oppose the war during its continuance, did in reality encourage and prolong it by a moral support, and, now that the war is ended in a triumph so contrary to its predictions, seeks to rob that victory of the fruits we had supposed secure.

"I know not how politicians may view this question. I am not in political circles; I have no hand in making platforms; nor am I skilled in party or partisan devices. But I know with unerring instinct how the soldiers who fought the battles feel upon this issue, and how the great popular heart of Maine, always patriotic, always true, will respond. The soldiers and the people, as one, will demand that their mutual efforts and mutual sacrifices shall not have been in vain. They demand that traitors, whether pardoned or unpardoned, shall not be clothed with political power; they demand that no injurious discrimination shall be made against any men who participated in the struggle for the preservation of the country. Political power must be impartially enjoyed by loyal men, and by loyal men alone.

"We must not repine over the past, nor be disheartened at the inevitable; but we shall be most recreant to duty if we fail to provide wisely for the future. Secession must be repudiated, with its debts and claims, its spirit and principles. We must have guarantees, good and sufficient, against any future attempt to destroy this Government, whether in the exercise of a pretended right by open war, or by the more artful and insidious assault against the principles on which this nation was founded. These are points we cannot yield without danger and dishonor; and when the Southern States shall have complied with these conditions in good faith, they will be in a position to ask association and fellowship with the loyal commonwealths of the country which they deserted with such violence and scorn. Until that time, in my judgment, it is wise to hold them in strict probation."

The publication of this letter silenced for a time the insinuations that Gen. Chamberlain was not "sound," and they were not revived until the day before the meeting of the convention, when the Portland *Press*, which had been strenuous and unremitting in its advocacy of the claims of Mr. Spring, renewed them more boldly and plainly. This action on the part of the *Press* naturally reacted against the gentleman whose cause it was intended to further. And when the charges were first made, in April, the same paper had said: "The rumors are probably without the slightest foundation. We have heard but almost forgotten them." When it was almost too late to disprove them the *Press* renewed them, sneered at Gen. Chamberlain's achievements in the field, and declared in effect that he had never been in sympathy with the party—had never voted for its candidates. The charges were cruelly unjust and untrue, and the members of the convention were convinced of the fact through the exertions mainly of the delegation from Brunswick.

Another element in the canvass has been the claim of the returned soldiers, *as* soldiers, on the gratitude and generosity of the people whom they defended. General Chamberlain's record, as a voter merely, having been proved to be satisfactory, he was nominated for governor simply because he had served with honor in the Union army. He has had absolutely no experience in politics or political affairs. He graduated at Bowdoin College, studied for the ministry at the Bangor Theological Seminary, and then became a member of the faculty of Bowdoin College. He remained there until August, 1862, when he was commissioned as lieutenant-colonel of the 20th Maine regiment. His subsequent military career was a highly honorable one, in which his native State justly takes pride. He was promoted by General Grant to the position of brigadier-general on the field—the solitary instance in the history of our army. At the close of the war Major-General Griffin especially recommended him for the full rank of major-general. This recommendation was approved by Generals Meade and Grant, and forwarded to Washington, where assurances were given that the promotion should be made. He has been six times wounded—twice severely. On the 18th of June, 1864, while leading an assault on foot at Petersburg, he was shot through the body from hip to hip, the ball passing through, severing arteries and fracturing bones. By all the rules of the surgeons, and in accordance with all their predictions, he ought to have died. At the time, he himself regarded the wound as mortal. He balanced himself on his sabre till his men passed him on the charge, when loss of blood caused him to fall to the ground. He has said that, regarding the wound as fatal, he thought it not worth while that he should be taken from the field until the day was really lost and he could only fall into the enemy's hands by remaining. It was for his action on this day that General Grant promoted him to the position of a brigadier-general.

In May last there was held at Bangor the first convention of the soldiers and sailors of Maine, their object being primarily to organize a Maine State Soldiers' and Sailors' Union. This union is designed to perpetuate their personal acquaintance and friendship; to aid and encourage all wise plans of the Government or of private benevolence for the support of families of deceased soldiers, and the procurement of employment for needy members, and to stimulate genuine patriotism and unflinching loyalty in the entire community. It was well understood, however, that the soldiers had their own preferences respecting a candidate for governor and for other State offices. The speeches at the convention contained frequent allusions to this fact; and it was strongly intimated that the politicians were disposed to violate their

promises, and to regard with jealous eyes those who had survived the struggle. For obvious reasons General Chamberlain did not attend the convention, and, in truth, he has kept aloof from any participation in the conduct of the campaign. But it was well understood (although the resolutions adopted carefully avoided any direct allusion to the subject) that he was the choice of those composing the convention, and that, should he not be nominated by the State Convention, his name would in all probability be submitted to the people by the executive committee of the Soldiers' and Sailors' Union. This, undoubtedly, had its influence in the convention.

General Chamberlain is a man of undoubted integrity and honor; an earnest and faithful student, and well versed in the political and general history of our own country as well as other nations. His experience in the field has certainly given him much insight into human nature; and the administrative and executive qualities brought into play there are those on which a demand will be made in his new position as governor of the State. The convention which nominated him strongly recommended him to the people, to whom he needed no endorsement; for his nomination was made by the people and not by the politicians. Party leaders and wire-pullers have signally failed in their efforts to control the nomination. A faithful history of their efforts, their means, and their failure, would present a curious picture in American politics.

JEALOUSY.

I LOVE my love so well, I would
There were no eyes but mine that could
See my sweet piece of womanhood,
And marvel of delight.

I dread that even the sun should rise,
That bold, bright rover of the skies,
Who dares to touch her closèd eyes,
And put her dreams to flight.

No maid could be more kind to me,
No truer maiden lives than she,
But yet I die of jealousy,
A thousand deaths in one.

I cannot bear to see her stop,
With her soft hand a flower to crop;
I envy even the clover-top
Her dear foot treads upon.

How cruel in my sight to bless
Even her bird with the caress
Of fingers that I dare not press,
Those lady fingers, white;

That nestle oft in that dear place
Between her pillow and her face,
And, never asking leave or grace,
Caress her cheek at night.

'T is torture more than I can bear
To see the wanton summer air
Lift the bright tresses of her hair,
And careless let them fall.

The wind that through the roses slips,
And every sparkling dew-drop sips,
Without rebuke may kiss her lips,
The sweetest rose of all.

I envy, on her neck of snow,
The white pearls hanging in a row,
The opals on her heart that glow,
Hushed with a tender red.

I would not, in her chamber fair,
The curious stars should see her, where
I, even in thought, may scarcely dare
For reverence to tread.

O maiden, hear and answer me
In kindness or in cruelty;
Bid me to live, or let me die,
I cry, and cry again!

Give me to touch one golden tress,
Give me thy white hand to caress,
Give me thy red, red lips to press,
And ease my jealous pain.

PHŒBE CARY.

Correspondence.

THE DUTY OF TRUTH-TELLING.

TO THE EDITOR OF THE NATION:

I read with interest the article of your contributor "L." in No. 59 of THE NATION, under the caption, "Does any one Tell the Truth." Whilst there are many statements therein to which all thoughtful men will agree, all of "L.'s" deductions will not so readily obtain general assent. Of these let me quote the following, substantially in his own words, as the basis of my remarks:

1. Perfect truthfulness in the present moral condition of our race is not attainable.

2. Deception is generally prevalent, and is necessary for the smooth working of our social machinery, and, therefore, in so far a good.

3. No man is morally bound to tell the truth always, but is morally justified in using deception as far as is recognized as necessary by the men of his age.

To the first of these propositions only I can give unqualified assent, and the reason that it is true is obvious. A man does not always speak the truth, simply because he is an imperfect being. Grant him a perfect moral organization, a conscience unerringly pointing out the right from the wrong, and a will always impelling him to do the former, and it would be impossible for him to lie. And just as his moral nature approaches or recedes from this perfection, just so will be the decrease or increase of his disposition to lie or to do any other evil thing.

We practise deception oftener than other sins because there are more opportunities for its commission, it goes oftenest unpunished, and its use is suggested more frequently by our self-interest, pride, vanity, etc., etc. It is generally our first step in the path of conscious wrong doing, and almost always duplicates itself and accompanies all the other sins. As soon as we do evil, we seek to deceive others as to our agency in the wrong act. So Cain no doubt only succeeded in killing Abel by first deceiving him as to his intention when approaching him, and, after committing the murder, sought to deceive God.

Whilst admitting the general prevalence of deception, I think there are many cases of daily occurrence of apparent deception in which there is really no intention to deceive.

If, for instance, I call upon that fascinating heiress, Miss Araminta Coupon, and Bridget, after due inquiry, brings back the answer "Not at home," when I am quite sure I just saw her form pass the parlor window as I turned the corner, is the idea that she is not actually in the house intended to be conveyed to me? Not at all. She may be entertaining her country cousin, Jemima, who will always make such untimely visits, and not wish to exhibit her gawkiness before my critical eyes; or she may be enjoying a delicious *tête-à-tête* with young Petroleum Jones, whom she accepted last week, and not care to be interrupted. "Not at home" is a general social phrase, including not only cases of actual absence from the house, but those wherein it is not convenient for the person visited to receive the visitor. Usage has substituted for its literal meaning an artificial one. We all understand it, and no one is deceived thereby.

Again, when next I meet with young Jones, after I hear of his engagement with Miss Coupon, do I practise deception because I grasp his hand warmly and congratulate him on his success? True, my pride, vanity, and disappointed hopes suggest to me that his sudden demise would not affect me disagreeably, and might still afford me an opportunity of gaining the hand of the heiress. But common sense and the natural kindly feeling I have for my fellow-man equally suggest that Jones has done me no wrong, and that I have no right to wish him otherwise than well. In cases where we are under the influence of contending emotions, we do not practise de-

ception by repressing our ignoble ones. For if we are true men, we do not wish nor intend to be guided by these, but only by those better ones which we express and which we strengthen by expression. As for the man who, whilst having good grounds for holding profound contempt for another, hypocritically treats him with respect and receives him as a friend, I hold him worthy of all condemnation. How your correspondent "L." can see that it is right for him to do so and wrong not to do so, surpasses my comprehension.

Granting for the moment that some deception is necessary for the smooth working of our social organization, no one but will admit that we use much more than seems needful for this purpose. We indulge in it unthinkingly, partly as the result of education and habit, partly because its use is congenial to our imperfect nature. We are so accustomed to commit those trivial errors (trivial they seem to us because they have apparently no immediate injurious influence) that we deceive daily when there is no necessity for it. Take, for instance, the point cited by "L.:" the right of an anonymous author to keep his own secret; is it really necessary for him to use the least deception to gain his object? Suppose Dr. Whewell were asked if he wrote the "Plurality of Worlds." Could he not say to his questioner, "Sir, the author of this work wishes to keep his name a secret from the public. I respect his right to do so, and cannot consent to aid you in your desire to thwart his purpose. As I cannot answer your question truthfully, either yes or no, without helping you to discover his secret, I decline to answer at all." Surely some such reply as this, courteous, polite, based upon sufficient motives, and yet not giving rise to the smallest deception, could be given in all such cases.

Everybody will admit, I think, that lying is a sin, when not necessary; but there arises the question, Who shall decide when it is necessary, and therefore (according to "L.'s" theory) morally lawful? "L." says, the men of the age. I doubt much if any considerable number of us would accept the variable opinions of their imperfect fellow-men as their sole criterion of right and wrong. We instinctively look higher, to some more absolute and perfect guide. As long as we consider lying a sin, no object, no matter how good, will sanctify its use to our hearts and consciences. Else we revert to the old Jesuitical dogma, that it is right to do evil that good may come. But, replies "L.," in such cases (where it is necessary to produce a beneficial result) deception is not a sin. Is it so? Does the sinfulness of an act depend upon its result, or upon the fact that the divine will has recognized it as a sin? The simple consideration that we, having only finite minds, can never know the full result of any act of ours, should be sufficient to point out the fallacy of this doctrine.

If it be a good thing (as "L." seems to admit) that our race is steadily approximating towards the ideal of absolute right, surely we will advance just as far and as rapidly if we set up this ideal as our goal, as if we select anything short of it; and we are likely to commit fewer errors if we aim to arrive as nearly as possible to perfection than if we aim at less. Conscientious and thoughtful men are not tortured because their rules of duty demand more of them than they are able to perform. They know full well that no man can do his whole duty, that every one must fall short of it a great deal. It is theirs to endeavor, by aiming at the highest standard, to reduce this deficiency to a minimum, and not, by aiming at a lower to which they can attain, to rest satisfied with this.

No, Mr. Editor; let our modern philosophers not cease still to hold that absolute truthfulness, absolute right, should be the basis of our moral code; our consciences ask this and will be satisfied with no less. Let us each endeavor, day by day, in all the details, no matter how trifling, of our lives, to fulfil all its requirements. It demands of us perfect charity and love towards others, the strict performance of our duty by ourselves. None of us, I know, will attain this perfection; but we shall approach nearest to it by making it our goal, and be ennobled by the effort. B.

New York, June 26, 1866.

[There are cases, such as that of Grotius's wife cited by Whewell, in which the choice lies not between simple truth and simple falsehood, but between two kinds of falsehood. Had she said that Hugo Grotius was in the box instead of saying that it was filled with books, she would have been true to truth but false to her husband; and, when we consider the comparative effect on society or on the individual character of these two kinds of falsehood, it is not so easy to concede that the claims of pure truth on our allegiance are always paramount. The world will always decide cases of this kind with reference to consequences, or, in other words, by the utilitarian standard.—Ed. Nation.]

A rich number; 20 cents, or $2 a year. Address, Fowler & Wells, New York.

FINANCIAL REVIEW.

NATION OFFICE, Thursday, June 28, 1866.

THE export of gold has ceased. The favorite packet *Scotia* sailed yesterday with only about $50,000 in bars. Gold is maintained between 153 and 156 by the operations of speculators in the gold-room, who have locked up a large proportion of the floating gold, and hope to put up the price by creating a scarcity for delivery. The adventure is a perilous one. At 3 P.M. to-day the premium stood at 151¾. Exchange is weaker again—bankers' sixty-day bills 108 to 108¼. There are those who believe that we "overshipped" specie this and last month, and that a further fall in exchange to the rates which were current in March last is not improbable. By the *Java*, which arrived here yesterday with dates to 17th, we learn that war had actually begun in Germany; our securities, however, showed no further weakness, and in some of the Continental markets a fresh demand for 5-20s had been developed. A few parcels are being exported from this country on the expectation of a revival in the German markets. Cotton is again rather better on the other side, and breadstuffs are reported firmer, with an advancing tendency.

Money continues very easy, and the policy of the department is calculated to perpetuate the present condition of affairs. Yesterday the department notified holders of debt certificates that it was ready to pay them off, and that interest on all of them would cease on the 15th of July. This, of course, will increase the volume of idle currency at the financial centres. Unless measures are taken by the Government to absorb some of this unemployed capital, speculation can hardly fail to break out during the summer, though it may not take the old direction of railway shares.

The stock market continues extremely dull, the only activity being in Governments, which are firm, with an upward tendency, and Erie, which declines slowly. At a meeting of directors held on Tuesday the dividend question was incidentally reviewed. It was demonstrated that the company had not only not earned the dividend on either the common or the preferred stock, but had actually failed to earn the interest on the bonds. It was suggested that—passing over the dividend on the common stock, which no person expects—the preferred stockholders might possibly claim priority over the companies whose roads are leased to the Erie, and that if the leases were paid, while the preferred stockholders were not, legal complications might arise. No vote was taken on the subject; it will not be finally decided till 15th proximo. Much concern is felt at the renewed embarrassments and probable financial failure of this great enterprise. The price of the stock is, for the time being, steadied by the excessive sales of the bear operators of the Street. In other stocks there is no movement worth mentioning. Canton was sold down on Tuesday to 52¾. Central, Fort Wayne, Reading, and Pittsburgh are pretty steady. Old Southern is rather lower. There has been a sharp recovery in mining stocks. Consolidated Gregory, which sold down to $10 a couple of weeks ago, has since been done at $24.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	June 21.	June 25.	June 28.	Advance.	Decline.
United States Sixes of 1881	106	106	110¾	4¾	....
5-20 Bonds, old	103⅛	103⅛	103⅛	....	....
5-20 Bonds of 1865	102⅞	102¾	....	....	....
10-40 Bonds	96⅜	96⅜	96⅞	⅜	....
7.30 Notes, second series	102¾	102⅝	103¾	1⅛	....
New York Central	99	98⅝	98¾	....	⅜
Erie Railway	58	58⅛	60⅞	2⅜	....
Hudson River	112	111	112	1	....
Reading Railroad	109	108½	109⅜	⅞	....
Michigan Southern	79¼	78¾	78½	....	¼
Cleveland and Pittsburgh	85	82½	83¼	¾	....
Chicago and North-western	30	29⅜	30½	1⅛	....
Chicago & North-western, Preferred	59	58¾	59¼	½	....
Chicago and Rock Island	95¼	93	94½	1½	....
P., Fort Wayne, and Chicago	98	98	98¼	¼	....
Canton	59	55	53⅝	....	1⅜
Cumberland	45⅛	44¾	45	¼	....
Mariposa	11⅜	11¼	11	....	¼
American Gold	150⅜	153⅛	151⅞	....	1⅛
Bankers' Bills on London	108¼	108¼	108¼	....	....
Call Loans	5	5	5	....	....

NEW AND IMPORTANT PLANS OF LIFE INSURANCE.

WHERE TO INSURE.

UNION MUTUAL LIFE INSURANCE COMPANY.

NEW YORK OFFICE, 151 BROADWAY.

ASSETS, over	$1,500,000
RECEIPTS for the year, over	700,000
DIVIDEND paid during the present fiscal year	69,160
TOTAL DIVIDENDS paid	419,000
TOTAL LOSSES paid	944,042

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

J. W. & H. JUDD, GENERAL AGENTS.

ESTEY'S COTTAGE ORGANS,

$100 TO $500.

These popular instruments excel all others in QUICKNESS OF ACTION, ROUNDNESS, PURITY, AND VOLUME OF TONE, accomplished by PATENT IMPROVEMENTS. The crowning perfection is the

VOX HUMANA TREMOLO,

a wonderful imitation of the sympathetic sweetness of the human voice.

They are strongly endorsed by Geo. W. Morgan, Wm. A. King, Chas. Fradel, and many others, the highest musical authority in the United States.

GEO. G. SAXE & CO.,
417 Broome Street, N. Y.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.
